This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.

+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

EDINBURGH:
W. AND R. CHAMBERS.

In the present publication, an effort has been made to place a work of the character of an encyclopædia within the reach of the working-classes and those next above them.

The plan on which the work is formed is to select only the subjects on which it is important that the mass in question should be informed. The minutiæ of biography and topography, scientific technicalities, and other matters to which there may be only need for occasional reference, are dismissed, and thus usually fills up the greater part of an encyclopædia is at once got quit of. There only remains a series of articles on the most important branches of science, physical, mathematical, and moral, natural history, political history, geography, and literature, together with a few miscellaneous papers, which seem specially called for by peculiar circumstances affecting the British people. Thus all is given which, if studied and received into the mind, would make an individual of those classes a *well-informed man*; while, with few exceptions, only that is omitted which is not needed as part of the standing knowledge of any person whatever, unless those for whom it may have a professional or local interest. It will be understood, then, that THE PENNY CYCLOPÆDIA FOR THE PEOPLE" is not meant as an encyclopædia unfailing in reference for all moments of human knowledge, but as an encyclopædia including such knowledge only as tends to improve every mind possessing it—such knowledge as expands, liberates, and fertilises—with the addition only of a very few articles of which the interest and value are of a more limited nature. The ruling principle has been to give what may be expected to prove the means of *self-education* to all ranks of the humbler classes of society as are debarred from the receipt of knowledge in more favourable circumstances.

It would have been quite possible to produce such a work, unexceptionable as far as the selection and treatment of subjects were concerned, but which should nevertheless have reached few of those for whom it is designed. Such would have necessarily been the effect of an unsuitable form and price. Here, as in the case of their JOURNAL, the editors found it necessary to disregard all common ideas as to what constitutes dignity in the externals of books. In reality, these ideas are merely relative, and there is not one sane and solid argument which could be used in support of them, however serviceable they may be in connecting puerile wits with matter of silly ridicule. But, whatever they were, it was necessary, if the CYCLOPÆDIA FOR THE PEOPLE was ever to reach its destination, that it should be published in detached parts, and those bearing a very small price. The plan accordingly followed has proved remarkably successful, the average sale of the various numbers of the work having been, throughout the first year, nearly [illegible] thousand! It is to be hoped that it may thus have proved the means of carrying a knowledge of things into regions where such knowledge would have never, but for this or similar undertakings, find its way. The editors are at the same time deeply sensible that even this work, great as its success has been, must leave a vast substratum of society totally untouched. At the very best, it addresses itself only to those who can read. The public must be reminded that there are great multitudes who do not share in this accomplishment, and for whom, of course, popular encyclopædias exist as much in vain as books for the blind. And not only is this great class forbidden all benefit from such works, but there is probably greater multitudes who, though able to read, are, from want of intellectual cultivation, totally void of all aptitude for knowledge, as to be nearly as little likely to profit from the stores here placed within their reach as those who never yet learned the alphabet. All attempts of this kind to send down light into the lower regions of society, must more or less fail from these causes—causes which will, of course, continue to exist, till we shall see an end put to the great disgrace of our age, the want of a national system of education.

Chiswick, *November* 3, 1841.

...nomy (from the Greek, *astron*, a star, and *nomos*, a ...), comprehensively, that science which explains ... and motions of the bodies filling infinite ..., including our own globe in its character of a ... of the number of the solar system. The science ... divided into two departments—1. *Descriptive* ..., or an account of the systems of bodies ... 2. *Mathematical Astronomy*, or an explana... of the physical laws which have produced and ... system the arrangements of the heavenly bodies, ... of the various results of the arrangement and ... of these bodies. *Uranography* is a subordi... department of the science, presenting an account ... arrangements which have been made by astro... for delineating the starry heavens, and working ... mathematical problems of which they are the ...

DESCRIPTIVE ASTRONOMY.

... early ideas of mankind respecting the objects ... by astronomy, proceeded upon appearances ... the uninstructed eye placed before them, and ... far from being true. It was supposed that the ... was, as it seems, a level plain, or, at the most, a ... curve, with an outer sphere, forming the heavens, ... seemed it rose in the twenty-four hours. ... philosophers deemed the earth the central and ... important object in the system, and regarded the ... lesser bodies, the sun, moon, planets, and stars, as ... relatively small objects, fixed in different crystal ..., each of which observed its own laws of revo... according to the apparent motions of the bodies ... in it. It was not till after much study and inves... that even the most enlightened minds arrived ... knowledge of the truth; nor was it for some time ... that the idea of the earth not being in the centre ... system, or any thing but a small and subordinate ... of it, was generally admitted. There is no room ... to trace all the steps by which the truth was as... ..., or to argue the uninstructed mind out of all ... it can in most concisive. We begin with what is usually called the Solar System—that is, the particular solar system to which our earth belongs.

THE SOLAR SYSTEM.

The *solar system*, so named from *sol* (Latin), the sun, consists of the sun in the centre, twenty-nine planets, and an unknown number of bodies named comets. The word planet is from the Greek, *planao*, to wander, because the few such bodies known to the ancients were chiefly remarkable in their eyes on account of their constantly shifting their places with reference to the other luminaries of the sky. Comets are so named from *coma* (Latin), a head of hair, because they seem to consist of one bright spot, and a long brush streaming from behind it.

Planets.—Eleven of the planets are called *primary*, because they move directly around the sun, and eighteen *secondary*, because they move round primary planets. The secondary planets are also denominated satellites, from *satellis* (Latin), originally signifying a life guardsman, but, by a wider application, one who follows and serves another. Only four of the primary planets have satellites.

The primary planets are Mercury, Venus, the Earth, Mars, Vesta, Ceres, Pallas, Juno, Jupiter, Saturn, and Herschel, or Uranus. Most of these names are derived from the fabulous divinities of ancient Greece. The Earth has one satellite, the Moon; Jupiter has four; Saturn, seven; and Uranus is supposed to have six.

The planets move round the sun on nearly one level or plane, corresponding with the centre of his body, and in one direction, from west to east. The secondary planets, in like manner, move in planes round the centres of their primaries, and in the same direction, from west to east. These are denominated revolutionary motions; and it is to be observed that they are double in the case of the satellites, which have at once a revolution round the primary, and a revolution, in company with the primary, round the sun. The path described by a planet in its revolution is called its

moving round its axis in 25 days. When viewed through a telescope, the surface appears intensely bright and luminous, as if giving out both heat and light to the surrounding planets. But on this surface there occasionally appear dark spots, generally surrounded with a border of less dark appearance; some of which spots have been calculated to be no less than 45,000 miles in breadth, or nearly twice as much as the circumference of the earth. The region of the sun's body on which the spots appear, is confined to a broad space engirdling his centre. They are sometimes observed to come into sight at his western limb, to pass across his body in the course of twelve or thirteen days, and then disappear. They are sometimes observed to contract with great rapidity, and disappear like something melted and absorbed into a boiling fluid. Upon the bright parts of the sun's body there are also sometimes observed streaks of unusual brightness, as if produced by the ridges of an agitated and luminous fluid. It has been surmised, that the sun is a dark b veloped in an atmosphere calculated for giving and light, and that the spots are produced b breaks or openings in that atmosphere, shov dark mass within. Though so much larger t earth, the matter of the sun is of only about a the density or compactness of that of our pl little more than the density of water.

The sun is surrounded to a great distance b light, or luminous matter of extreme thinness like a lens or magnifying-glass, the body of being in the centre, and the luminous matter e: in the plane of the planetary revolutions, till nates in a point. At particular seasons, and in able states of the atmosphere, it may be o before sunrise or after sunset, in the form o pointing obliquely above the place where th either about to appear or which he has just le termed the *Zodiacal Light*.

Mercury, the nearest planet to the sun, is a globe of about 3140 miles in diameter, rotating on its axis in 24 hours and 5½ minutes, and revolving round the central luminary, at a distance of 37,000,000 of miles, in 88 days. From the earth it can only be seen occasionally in the morning or evening, as it never rises before, or sets after the sun, at a greater distance of time than 1 hour and 50 minutes. It appears to the naked eye as a small and brilliant star, but when observed through a telescope, is horned like the moon, because we only see a part of the surface which the sun is illuminating. Mountains of great height have been observed on the surface of this planet, particularly in its lower or southern hemisphere. One has been calculated at 10½ miles in height, being about eight times higher, in proportion to the bulk of the planet, than the loftiest mountains upon earth. The matter of Mercury is of much greater density than that of the earth, equalling lead in weight; so that a human being placed upon its surface would be so strongly drawn towards the ground as scarcely to be able to crawl.

Venus is a globe of about 7800 miles in diameter, or nearly the size of the earth, rotating on its axis in 23 hours, 21 minutes, and 19 seconds, and revolving round the sun, at the distance of 68,000,000 of miles, in 225

Like Mercury, it is visible to an observer on the [illegible] *only in the morning and evening, but for a greater* [illegible] *of time before sunrise and after sunset. It appears most brilliant and beautiful of all the planetary* and stellar bodies, occasionally giving so much to produce a sensible shadow. Observed throu scope, it appears horned, on account of our se a part of its luminous surface. The illumin of Venus occasionally presents slight spots. It ascertained that its surface is very unequal, the mountains being in the southern hemisphere, case of both Mercury and the Earth. The high tains in Venus range between 10 and 22 mil tude. The planet is also enveloped in an atr like that by which animal and vegetable life ported on earth; and it has consequently a Venus performs its revolution round the su days. Mercury and Venus have been termed ferior Planets, as being placed within the orl Earth.

The Earth, the third planet in order, and o smaller size, though not the smallest, is imp us, as the theatre on which our race have be to "live, move, and have their being." It is 7 in mean diameter, rotating on its axis in 24 h mean distance of 95,000,000 of miles from round which it revolves in 365 days, 5 hour nutes, and 57 seconds. As a planet viewed other of the planets, suppose the moon, "it w sent a pretty, variegated, and sometimes a appearance. The distinction between its seas continents, and islands, would be clearly mark would appear like brighter and darker spots

disc. The continents would appear bright, and the ocean of a darker hue, because water absorbs the greater part of the solar light that falls upon it. The level plains (excepting, perhaps, such regions as the Arabian deserts of sand) would appear of a somewhat darker colour than the more elevated and mountainous regions, as we find to be the case on the surface of the moon. The islands would appear like small bright specks on the darker surface of the ocean; and the lakes and mediterranean seas like darker spots or broad streaks intersecting the bright parts, or the land. By its revolution round its axis, successive portions of the surface would be brought into view, and present a different aspect from the parts which preceded."*

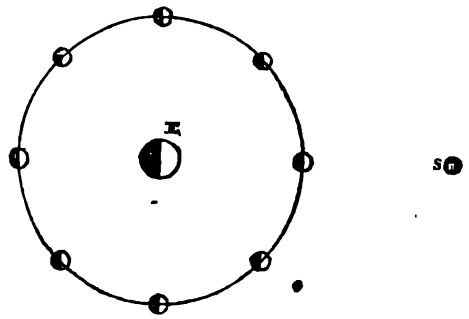
The form of the earth, and probably that of every other planet, is not strictly spherical, but spheroidal; that is, flattened a little at the poles, or extremities of the axis. The diameter of the earth at the axis is 26 miles less than in the cross direction. This peculiarity of the form is a consequence of the rotatory motion, as will be afterwards explained.

The earth is attended by one satellite, the *Moon*, which is a globe of 2160 miles in diameter, and consequently about a 49th part of the bulk of the earth, revolving round its primary in 27 days, 7 hours, 43 minutes, and 11 seconds, at the distance of 240,000 miles. The moon is 400 times nearer the earth than the sun is; but, its diameter being at the same time 400 times less than that of the sun, it appears to us of about the same size. The moon rotates on her axis in exactly the same time as she revolves round the earth. She consequently presents at all times the same part of her surface towards the earth. Inspected through a telescope, her surface appears of unequal brightness, and extremely rugged. The dark parts, however, are

Telescopic appearance of the Moon.

not seas, as has been supposed, but more like the beds of seas, or great alluvial plains. No appearance of water, or of clouds, or of an atmosphere, has been detected. The surface presents numerous mountains, some of them about a mile and three quarters in height, as has been ascertained by measurement of the shadows which they cast on the neighbouring surface. The tops of the mountains of the moon are generally shaped like a cup or basin, with a small eminence rising from the centre, like many volcanic hills on the earth. It has hence been surmised that the moon is in a *volcanic state*, as the earth appears to have been for many ages before the creation of man, and that it is perhaps undergoing processes calculated to make it a fit scene for animal and vegetable life.

The moon, turning on its axis once in a little more than 27 days, presents every part of its surface in succession to the sun in that time, as the earth does in 24 hours. The *day* of the moon is consequently nearly a fortnight long, and its *night* of the same duration. The light of the sun, falling upon the moon, is partly absorbed into its body; but a small portion is reflected or thrown back, and becomes what we call *moonlight*. The illuminated part, from which we derive moonlight, is at all times increasing or diminishing in our eyes, as the moon proceeds in her revolution around our globe. When the satellite is at the greatest distance from the



Phases of the Moon.

sun, we, being between the two, see the whole of the illuminated surface, which we accordingly term *full moon*. As the moon advances in her course, the luminous side is gradually averted from us, and the moon is said to wane. At length, when the satellite has got between the earth and the sun, the luminous side is entirely lost sight of. The moon is then said to *change*. Proceeding in her revolution, she soon turns a bright edge towards us, which we call the *new moon*. This gradually increases in breadth, till a moiety of the circle is quite filled up; it is then said to be *half moon*. The luminary, when on the increase from *new* to *half*, is termed a crescent, from *crescens*, Latin for increasing; and this word has been applied to other objects of the same shape—for instance, to a curved line of buildings.

In the early days of the new moon, we usually see the dark part of the body faintly illuminated, an appearance termed the *old moon in the new moon's arms*. This faint illumination is produced by the reflection of the sun's light from the earth, or what the inhabitants of the moon, if there were any, might be supposed to consider as moonlight. The earth, which occupies one invariable place in the sky of the moon, with a surface thirteen times larger than the apparent size of the moon in our eyes, is then *at the full*, shining with great lustre on the sunless side of its satellite, and receiving back a small portion of its own reflected light. The light, then, which makes the dark part of the moon visible to us, may be said to perform three journeys, first from the sun to the earth, then from the earth to the moon, and finally from the moon back to the earth, before our eyes are enabled to perceive this object.

Mars, the fourth of the primary planets, is a globe of 4139 miles in diameter, or little more than a half of that of the earth; consequently, the bulk of this planet is only about a 5th of that of our globe. It performs a rotation on its axis in 24 hours, 39 minutes, and 21⅓ seconds, and revolves round the sun, at a distance of 142,000,000 of miles, in 686 days, 22 hours, and 18 seconds. Mars appears to the naked eye of a red colour; from which circumstance it was, probably, that the ancients bestowed upon it the name of the god of war. Inspected through a telescope, it is found to be occasionally marked by large spots and dull streaks, of various forms, and by an unusual brightness at the poles. As the bright polar parts sometimes project from the circular outline of the planet, it has been conjectured that these are masses of snow, similar to those which beset the poles of the earth.

Vesta, Ceres, Pallas, and *Juno*, are four small globes,

* Dick's Celestial Scenery, 135.

revolving between the orbits of Mars and Jupiter, in paths near and crossing each other, and which are not only much more elliptical than the paths of the other planets, but also rise and sink much further from the plane of the general planetary revolutions.

Vesta is of a bulk only 1-15,000th part of the bulk of the earth, with a surface not exceeding that of the kingdom of Spain. It revolves round the sun in 3 years, 66 days, and 4 hours, at a mean distance of 225,500,000 miles. Though the smallest of all the planets, it gives a very brilliant light, insomuch that it can be seen by the naked eye.

Juno is 1425 miles in diameter, and presents, when inspected through the telescope, a white and well-defined appearance. Its orbit is the most eccentric of all the planetary orbits, being 253,000,000 of miles from the sun at the greatest, and only 126,000,000, or less than one-half, at the least distance. In the half of the course nearest to the sun, the motion of the planet is, by virtue of a natural law afterwards to be explained, more than twice as rapid as in the other part.

Ceres has been variously represented as of 1624 and and 160 miles in diameter. The astronomer who calculated its diameter at 1624 miles, at the same time believed himself to have ascertained that it has a dense atmosphere, extending 675 miles from its surface. It is of a reddish colour, and appears about the size of a star of the eighth magnitude. Ceres revolves round the sun, at a distance of 260,000,000 of miles, in 4 years, 7 months, and 10 days.

Pallas has been represented as of 2099 miles in diameter, with an atmosphere extending 468 miles above its surface. Another astronomer has allowed it a diameter of only 80 miles. It revolves round the sun, at a mean distance of 266,000,000 of miles, in 4 years, 7 months, and 11 days. However unimportant it may appear beside the larger planets, it has a peculiar interest in the eyes of astronomers, on account of its orbit having a greater inclination to the plane of the ecliptic than those of all the larger planets put together.

These four planets, which are sometimes called *asteroids*, have only recently become known to mankind. Ceres was discovered at Palermo in Sicily, on the 1st of January 1801, by M. Piazzi, who gave it this name in honour of the tutelary goddess of his native country. Pallas was discovered at Bremen, in Lower Saxony, on the 28th of March 1802, by Dr Olbers. Juno was discovered by Mr Harding, at the observatory of Lilienthal, near Bremen, on the 1st of September 1804. Vesta was discovered on the 29th of March 1807, by the same astronomer who had discovered Pallas.

Jupiter is the largest of all the planets. Its diameter is nearly eleven times that of the earth, or 89,170 miles, and its volume or mass is consequently 1231 times that of our globe. The density of Jupiter is only a fourth of that of the earth, or about the lightness of water; and a human being, if transferred to it, would be able to leap with ease over a pretty large house. It performs a rotation on its axis in 9 hours, 55 minutes, and 33 seconds, or about two-fifths of our day. It revolves round the sun, at a distance of 490,000,000 of miles, in 4330 days, 14 hours, and 39 minutes, or nearly twelve of our years. Viewed through a telescope, Jupiter appears surrounded by dark lines, or belts, which occasionally shift, melt into each other, or separate, but sometimes are observed with little variation for several months. These belts are generally near the equator of the planet, and of a broad and straight form; but they have been observed over his whole surface, and of a lighter, narrower, and more streaky and wavy appearance. It is supposed that the dark parts are lines of the body of the planet, seen through openings in a bright cloudy atmosphere.

Jupiter is attended by four satellites, which revolve round it, in the same manner as the moon round our globe, keeping, like it, one face invariably presented to their primary. They are of about the same size, or a little larger diameter than our moon; the first having a diameter of 2508, the second of 2068, the third of 3377, and the fourth of 2890 miles. The first revolves round the primary planet in 1 day, 18 hours, 28 minutes; the second in 3 days, 13 hours, 14 minutes; the third in 7 days, 3 hours, 43 minutes; and the fourth in 16 days, 16 hours, 32 minutes. These satellites frequently eclipse the sun to Jupiter; they are also eclipsed by the primary planet, but never all at the same time, so that his dark side is never altogether without moonlight.

The satellites of Jupiter were discovered by Galileo, being among the first results of the invention of the telescope. They have been of great use in several astronomical calculations of importance, particularly in suggesting the theory of the gradual propagation of light. It having been observed that their eclipses always took place sooner than was to be expected when the earth was near Jupiter, and later when it was at the greatest distance, an astronomer solved the difficulty by supposing that light required some time to travel—a conjecture which was afterwards confirmed by other observations.

Saturn, seen through a telescope, is the most remarkable of all the planets, being surrounded by a ring, and attended by seven satellites. In bulk this is the second of the planets, being 79,042 miles in diameter, or about 995 times the volume of the earth. Its surface appears slightly marked by belts like those of Jupiter. It performs a rotation on its axis in 10 hours, 16 minutes, and revolves round the sun, at a distance of 900,000,000 of miles, in 10,746 days, 19 hours, 16 minutes, or about 29½ of our years. At such a distance from the sun, that luminary must be diminished to one-eightieth of the size he bears in our eyes, and the heat and light in the same proportion. The matter of Saturn is one-eighth of the density of our earth.

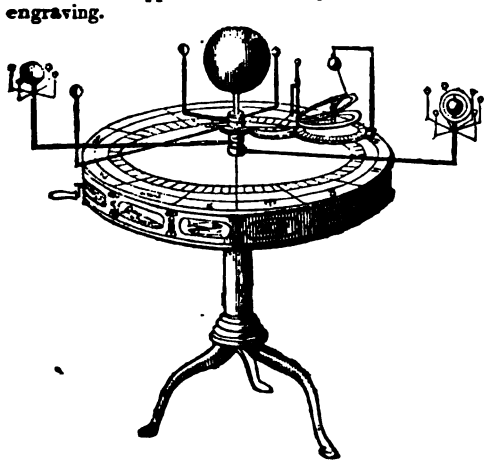
The ring of Saturn surrounds the body of the planet in the plane of its equator. It is thin, like the rim of a spinning wheel, and is always seen with its edge presented more or less directly towards us. It is luminous with the sun's light, and casts a shadow on the surface of the planet, the shadow of which is also sometimes seen falling on part of the ring. The distance of the inner edge from the planet is calculated at about 19,000 miles; its entire breadth from the inner to the outer edge is 28,538; the thickness is not more than 100. In certain positions of the planet, we can see its surface at a considerable angle, and the openings or loops which it forms at the sides of the planet. At other times we see its dark side, or only its edge. From observations made upon it in favourable circumstances, it is found to be apparently divided near the outer edge by a dark line of nearly 1800 miles in breadth, as if it were divided into two concentric rings. From other appearances, it has been surmised to have other divisions, or to be a collection of several concentric rings. It is also occasionally marked by small spots. The ring of Saturn rotates on its own plane in 10 hours, 32 minutes, 15 seconds, and a part of a second, being about the same time with the rotation of the planet.

The seven satellites of Saturn revolve around it, on the exterior of the ring, and almost all of them in nearly the same plane. They are so small as not to be visible without a powerful telescope. The two inner ones are very near to the outer edge of the ring, and can only be discerned when that object is presented so exactly edgeways as to be almost invisible. They have then been seen passing like two small bright beads along the minute thread of light formed by the edge of the ring. The three next satellites are also very small; the sixth is larger, and placed at a great interval from the rest. The seventh is the largest; it is about the size of the planet Mars, and is situated at nearly thrice the distance of the sixth, or about 2,300,000 miles from the body of Saturn. The revolutions of these satellites range from 1 to 79 days; and it has been ascertained of some of them that, according to the usual law of secondary planets, their rotations on their axes and their revolutions round their primary are performed in the same time, so that, like our moon, they always present the same face to the centre of their

system. The orbit of the seventh satellite is much inclined to the plane of Saturn's equator.

Uranus, or *Herschel*, the remotest planet known in the solar system, is a globe of 35,112 miles in diameter, rotating on its axis in 7 hours, and performing a revolution round the sun, at the distance of 1800,000,000 of miles, in 84 of our years. It was discovered, on the 13th of March 1781, by Sir William Herschel, at Bath. The sun to this remote planet must appear only a 400th part of the size which he bears in our eyes. Two satellites are known, and other four are suspected, to attend upon Uranus. The two which have been observed circulate round their primary in orbits almost perpendicular to the ecliptic, and are further supposed to move in a direction contrary to that of all the other planetary motions—namely, from east to west.

Some idea may be obtained of the comparative size of the principal objects of the solar system, by supposing a globe of two feet diameter, placed in the centre of a level plain, to represent the sun; a grain of mustard-seed, placed on the circumference of a circle 164 feet in diameter, for Mercury; a pea, on a circle of 284 feet, for Venus; another pea, on a circle of 430 feet, for the Earth; a large pin's head, on a circle of 654 feet, for Mars; four minute grains of sand, in circles of from 1000 to 1200 feet, for Vesta, Ceres, Pallas, and Juno; a moderate-sized orange, on a circle of nearly half a mile in diameter, for Jupiter; a small orange, on a circle four-fifths of a mile in diameter, for Saturn; and a small plum, or full-sized cherry, on a circle of a mile and a half in diameter, for Uranus. It is calculated that the united mass of the whole of the planets is not above a 600th part of the mass of the sun. The sun and planets are represented, with an approximation to correctness, in philosophical toys termed orreries, of which the appearance is conveyed in the annexed engraving.



Orrery.

COMETS.

Comets are light vapoury bodies, which move round the sun in orbits much less circular than those of the planets. Their orbits, in other words, are very long ellipses or ovals, having the sun near one of the ends. Comets usually have two parts, a body or nucleus, and a tail; but some have a body only. The body appears as a thin vapoury luminous mass, of globular form; it is so thin, that, in some cases, the stars have been seen through it. The tail is a lighter or thinner luminous vapour, surrounding the body, and streaming far out from it in one direction. A vacant space has been observed between the body and the enveloping matter of the tail; and it is equally remarkable that the tail has in some instances appeared less bright along the middle, immediately behind the nucleus, as if it were a stream which that nucleus had in some measure parted into two.

In ignorant ages, the sudden appearance of a comet in the sky never failed to occasion great alarm, both on account of its threatening appearance, and because it was considered as a sign that war, pestilence, or famine, was about to afflict mankind. Knowledge has dispelled all such fancies; but yet we are not well acquainted with the nature of comets.

Out of the great multitude—certainly not less than 1000—which are supposed to exist, about 150 have been made the subject of scientific observation. Instead of revolving, like the planets, nearly on the plane of the sun's equator, it is found that they approach his body from all parts of surrounding space. At first, they are seen slowly advancing, with a comparatively faint appearance. As they approach the sun, the motion becomes quicker, and at length they pass round him with very great rapidity, and at a comparatively small distance from his body. The comet of 1680 approached within one-sixth of his diameter. After passing, they are seen to emerge from his rays, with an immense increase to their former brilliancy and to the length of their tails. Their motion then becomes gradually slower, and their brilliancy diminishes, and at length they are lost in distance. It has been ascertained that their movement round the sun is in accordance with the same law which regulates the planetary movements, being always the quicker the nearer to his body, and the slower the more distant. In the remote parts of space their motions must be extremely slow.

Three comets have been observed to return, and their periods of revolution have been calculated. The most remarkable of these is one usually denominated Halley's Comet, from the astronomer who first calculated its period. It revolves round the sun in about seventy-five years, its last appearance being at the close of 1835. Another, called Enke's Comet, from Professor Enke of Berlin, has been found to revolve once in 1207 days, or 3⅓ years; but, in this case, the revolving body is found, at each successive approach to the sun, to be a little earlier than on the previous occasion, showing that its orbit is gradually lessening, so that it may be expected ultimately to fall into the sun. This fact has suggested that some part of that space through which the comet passes, must be occupied by a matter presenting some resistance to the movement of any denser body; and it is supposed that this matter may prove to be the same which has been described as constituting the zodiacal light. It is called a *resisting medium;* and future observations upon it are expected to be attended with results of a most important nature, seeing that, if there be such a matter extending beyond the orbit of the earth, that planet, in whose welfare we are so much interested, will be exposed to the same ultimate fate with Enke's Comet.

The third, named Beila's Comet, from M. Beila of Josephstadt, revolves round the sun in 6¾ years. It is very small, and has no tail. In 1832, this comet passed through the earth's path about a month before the arrival of our planet at the same point. If the earth had been a month earlier at that point, or the comet a month later in crossing it, the two bodies would have been brought together, and the earth, in all probability, would have instantly become unfit for the existence of the human family. Comets are often affected in their motions by the attraction of the planets. Jupiter, in particular, has been described by an astronomer as a perpetual stumbling-block in their way. In 1770, a comet got entangled amidst the satellites of that planet, and was thereby thrown out of its usual course, while the motions of the satellites were not in the least affected.

Comets often pass unobserved, in consequence of the part of the heavens in which they move being then under daylight. During a total eclipse of the sun, which happened sixty years before Christ, a large comet, not formerly seen, became visible, near the body of the obscured luminary. On many occasions, their smallness and distance render them visible only by the aid of the telescope. On other occasions, they are of vast

size. The comet now called Halley's, at its appearance in 1456, covered a sixth part of the visible extent of the heavens, and was likened to a Turkish scymitar. That of 1680, which was observed by Sir Isaac Newton, had a tail calculated to be 123,000,000 of miles in length, a space greater than the distance of the earth from the sun. There was a comet in 1744, which had six tails, spread out like a fan across a large space in the heavens. The tails of comets usually stretch in the direction opposite to the sun, both in advancing and retiring, and with a slight wave at the outer extremity, as if that part experienced some resistance.

THE STARS.

The idea at which astronomers have arrived respecting the stars, is, that they are all of them suns, resembling our own, but diminished to the appearance of mere specks of light by the great distance at which they are placed. As a necessary consequence to this supposition, it may be presumed that they are centres of light and heat to systems of revolving planets, each of which may be further presumed to be the theatre of forms of being bearing some analogy to those which exist upon earth.

The stars seen by the naked eye on a clear night are not above a thousand in number. This, allowing a like number for the half of the sky not seen, gives about two thousand in all of visible stars. These are of different degrees of brilliancy, probably in the main in proportion to their respective distances from our system, but also perhaps in some measure in proportion to their respective actual sizes. Astronomers class the stars under different *magnitudes*, not with regard to apparent size, for none of them present a measurable disc, but with a regard to the various quantities of light flowing from them: thus, there are stars of the first magnitude, the second magnitude, and so on. Only six or seven varieties of magnitude are within our natural vision; but with the telescope vast numbers of more distant stars are brought into view; and the magnitudes are now extended by astronomers to at least sixteen.

The stars are at a distance from our system so very great, that the mind can form no idea of it. The brilliant one called Sirius or the Dog-star, which is supposed to be the nearest, but merely because it is the most luminous, has been reckoned by tolerably clear calculation to give only 1-20,000,000th part of the light of the sun: hence, supposing it to be of the same size, and every other way alike, it should be distant from our earth not less than 1,960,000,000,000,000,000 miles. An attempt has been made to calculate the distance of Sirius by a trigonometrical problem. It may be readily supposed that the position of a spectator upon the earth with respect to celestial objects must vary considerably at different parts of the year: for instance, on the 21st of June, he must be in exactly the opposite part of the orbit from what he was on the 21st of December—indeed, no less than 190,000,000 of miles from it, or twice the distance of the earth from the sun. This change of position with relation to celestial objects is called *parallax*. Now, it has been found that Sirius is so distant, that an angle formed between it and the two extremities of the earth's orbit is too small to be appreciated. Were it so much as one second, or the 3600th part of a degree, it could be appreciated by the nice instruments we now possess; but it is not even this. It is hence concluded that Sirius must be at least 19,200,000,000 of miles distant, however much more! Supposing this to be its distance, its light would take three years to reach us, though travelling, as it does, at the rate of 192,000 miles in a second of time!

It is ascertained beyond doubt, that some stars, at e time visible, and registered by ancient astronomers, are not now to be seen; while many instances are on *record of* stars which have come into sight for a time, *then gradually vanished. A large star suddenly so visible 125 years before Christ*, and attracted *tion of Hipparchus, who* was thereby induced *up a catalogue of stars, the first* ever made.

In the year 389, a star blazed forth in the co Aquilla,* and, after remaining for three week as the planet Venus, disappeared. A star a the region of the heavens between Cepheus opeia, in the years 945, 1264, and 1572, and i to be one which comes within our sight o three hundred and nineteen years, or thereb last appearance, it was very attentively obser celebrated Danish astronomer Tycho Brahe, lished a volume respecting it. Its appearar sudden, that, in returning from his laborat dwelling-house, he found a group of count gazing at it, and was satisfied it had not be quarter of the sky half an hour before. I as bright as Sirius, and continued till it Jupiter when brightest, and was visible at It disappeared entirely about eighteen mo being first observed. Another bright star in the constellation Serpentarius, in October remained for a year. It is mentioned by cont writers, that, at the birth of Charles II. in 16 star, never before observed, appeared in the as if to mark something extraordinary in th of the child that day ushered into existence. stances have been noticed in still more rec but, upon the whole, this is a point in whic mical observation is defective. It seems, h be clearly ascertained that some, if not all of have periodical motions throughout space, s rapid than others. In several of the instan the period is short, there is no want of posit ledge. It has been ascertained, for instance star Omicron, in Cetus, has a periodical mov cupying 334 days. It is seen as bright as a second magnitude for about a fortnight; then diminishes for three months, till it becomes in which state it remains for five months, wh becomes visible, and gradually increases till its former brightness, more or less—for it always reach the same degree of lustre. Algol, in the constellation Perseus, continu during a period of sixty-two hours, when it loses its splendour, and from a star of the se nitude, is reduced, in three hours and a ha fourth; after which it begins to increase, an hours and a half resumes its former size. eleven other stars which exhibit analogous pl some of them at intervals of five hundred which we may look forward without any dang take. Astronomers have not yet made suffic tensive observations to settle whether our have any motion through space; but that it a motion, has been surmised without any ap ference to this branch of inquiry.

Another variety in the nature of these lum their being in some instances, not *single* star appear to the naked eye, but a group of two evidently, from their motions, forming on The star Castor, one of the Twins, is found, w magnified, to consist of two stars, of between and fourth magnitude, within five seconds (a v space) of each other. Sir William Hersc observations upon more than 500 stars of where the distance is not more than half a mi a very small space); and to this list a fore nomer has added five times that number. N reason to suppose that, in *all* these instances, stars is at a great distance behind the other, they are only brought together by the accide position. Many of the double stars no doubt

* It may be stated here, in anticipation of more pa planations to be given afterwards, that the starry hea astronomers mapped out into a series of constellations blages of stars, each of which bears the name of so other object, as *Aquila* the Eagle, *Cetus* the Whale, *Pollux*, twin demigods of the Greek mythology, &c. cular star in a constellation, in the order of its m distinguished by a letter of the Greek alphabet, and, are exhausted, with a number.

tally brought together; but of a great number
een fully ascertained that they are each a sys-
ith a reciprocal relation to each other. They
erefore called *Binary Stars*. It is generally
ed that they move round each other within
in time, and in elliptical orbits; the revolution
or, for instance, is supposed to be accomplished
years; of ξ of Ursa Major, in 58½ years; of 70
ici in 78 years. In fact, there is the same variety
branch of the starry system as in its other de-
nts, and the revolutions of the few binary stars
ave been accurately surveyed range from forty-
o twelve hundred years. Several of these dupli-
ars have made a revolution since they were first
ed, and are now advancing in their second period.
Hercules, was seen double, in 1782, by Sir
m Herschel; in 1795, it was hardly distinguish-
o be double; in 1802, it was double no longer,
e being eclipsed by the other, though a small
f one was still jutting out at the side of the other;
omers are now watching to observe them once
ecome separate. Whether one of these stars
to the other as a sun, or whether both are suns,
ther the organised life with which they are pro-
stored, be of a kind which can endure a perpetual
nd heat thrown from the one to the other—or in

reury, one of the deities; and hence its name.
examined by a telescope, it is found to consist
ly of stars, "scattered by millions," as Sir John
hel beautifully describes them, "like glittering
on the black ground of the general heavens."
verage magnitude of these stars is about the tenth
eleventh, and hence their invisibility to the naked
It is a very remarkable circumstance, that, though
ars of the larger magnitudes are scattered with
lerable equality over the whole heavens, there is
able clustering of the smaller ones towards the
of this ring. Sir William Herschel, by gauging,
were, the depth of our starry system in this and
parts, arrived at what he believed to be an ap-
mation to the figure of the system itself—namely,
ongated cake-shaped mass, parting flat-wise into
t one particular part of the exterior (where the
Way is double), and in which our solar system
laced somewhat nearer the one extremity than
ther. Where the distance between two stars is
eat as we have seen, and we can suppose the dis-
between all the rest to be no less, what must be
ntire extent of this star-system, composed as it is
llions of millions of distinct bodies!

NEBULÆ.

ithin the bounds of what has here been called the
system, great numbers of bodies have been dis-
ed, which, from their cloud-like appearance, are
d *Nebulæ*. There is one of magnificent appearance
girdle of the constellation Andromeda, and another
more splendid in the sword-hilt of Orion, both vi-
to the naked eye. Some of these objects are of
irregular form, stretching like a fragment of semi-
cid membrane over the sky, with patches of brighter
er scattered irregularly throughout their extent.
thers, the bright patches are of greater intensity,
to have the decided appearance of *gatherings* of
matter towards a particular point. Others there
in which these bright parts seem nearly disengaged
the surrounding thin matter, or only bedded on a
slight background composed of it. In a fourth class, we see detached masses, approaching more or less to a spherical form, and with various measures of comparative brightness towards the centre, until they resemble a star with only a slight *bur* around it. It is a new and startling surmise of astronomers, that these are examples of a series of states in which nebulous matter exists, during a process forming it into solar systems more or less analogous to our own—belated portions, so to speak, of the same soft and diffused material, which, countless ages ago, was condensed into the defined bodies forming the remainder of our star-system!

There is much, it must be owned, to support this hypothesis, startling as it is. The physical laws known to operate in our own solar system are in perfect harmony with it. It has been shown that such matter, in agglomerating, would necessarily assume a spherical form, just as a drop of dew takes that shape on the point of a thorn, namely, by the law of attraction. Particles of any fluid matter, flowing towards a centre, will, unless in the extraordinary circumstances of their meeting in a direct line (circumstances which scarcely ever occur), form a whirl or vortex. The meeting of two currents of the ocean forming a whirlpool, or of two currents of air forming a whirlwind, or even such a trivial and familiar phenomenon as the sinking of water through a funnel, are examples of the working of this law of matter. Hence, then, a rotatory motion would be an almost unavoidable result of the agglomeration of a mass of nebulous matter. In this we can, of course, see the origin of such a motion as that which our sun is known to have upon his axis.

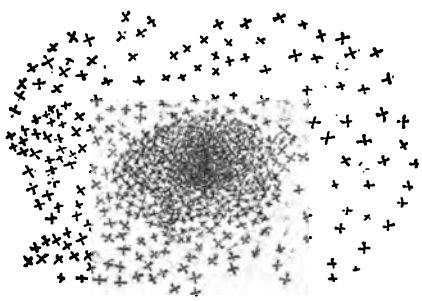
And not only are the formation and movements of suns to be thus accounted for, but it has been shown that the same laws will explain how a whole planetary system may have been made up. As the process of condensation in a nebular mass proceeds, the whirling motion must always become more rapid, just as a sling, when the string is allowed to wind up round our finger, flies always the faster as the string shortens. While the rotatory motion is thus increasing, the centrifugal force may become too great to permit the outer and probably softer portion to adhere to the mass; and this outer and softer portion will therefore be left off as a ring surrounding the principal mass at a little distance. Other portions may thus be successively detached, till a considerable number of rings will be left encircling the central mass. Only if the matter of these rings be of an uniform character, can it be expected that they should continue as rings. Almost necessarily, there will be inequalities in their composition, causing them to break up into pieces, each of which, by virtue of gravity, will then collapse into a sphere. A sphere, thus formed, must needs retain the same revolutionary motion as the ring of which it once formed a part, and at the same time it must acquire a rotatory motion in the same direction. Thus we have a set of primary planets, the bodies of which have only to undergo the same processes as the central mass, in order to throw off satellites. The two rings which surround Saturn appear an example of two exterior portions of that planet as yet not advanced from the intermediate state, but which may in time become additions to the number of his satellites. The zodiacal light may also be a residue, of extreme thinness, of the matter of which our system was formed.

It might be supposed that this hypothesis, ingenious as it is, could scarcely be stretched to account for the formation of solar systems in which there are two suns revolving round each other. But this difficulty is easily overcome. It has been shown that the nebulous matter, in certain cases, may assume that arrangement. On the surface of a flowing stream, in which slight repulsions of water from the banks produce little eddies, how common is it to see two of those miniature whirlpools come within each other's influence, and then go on wheeling round each other: *precisely in that manner* do the two suns of a binary star carry on their revolutions, and from circumstances

of a similar nature, though upon so much greater a scale, may these revolutions have originated.

REMOTE STAR-SYSTEMS.

Our own star-system, inconceivably vast as it is, is but an item of the heavenly inventory. Far beyond its bounds, the telescope of Herschel has descried similar systems in great numbers, each hanging in some tolerably defined shape in the vast empyrean, and each capable of being resolved, not exactly into stars, though these are in some instances visible, but into what has been expressively called *star-dust*, a collection of small brilliant particles, each of which would probably appear a distinct sun under a stronger power of artificial vision. Observations have been made upon these star-systems chiefly in the direction of the thinner parts of our own system, where the sky is clearest of our own stars, and where of course they are most distinct from other and nearer objects. But even in these limited fields of the sky very great numbers have been seen—between 1000 and 2000 in the northern hemisphere alone—a number, we must recollect, exceeding that of all the ordinarily visible stars in the same moiety of the heavens.



Remote Star-System.

They are of various forms, but in general, as has been said, tolerably well defined, and therefore differing entirely from the irregularly diffused matter of our nebulæ. Many appear as spherical clusters, with a crowding of the star-dust towards the centre: of this kind there is a brilliant example in the constellation Hercules. It has been remarked, that in the worlds about the centre of such clusters, the visible heavens must be inconceivably brilliant, though they will have no appearances resembling our milky way. There is another spherical class, in which the external parts are the most brilliant: in these cases, the visible heavens of a world near the centre will probably be almost entirely composed of milky way. From our earth these annular clusters are presented in various points of view, some so nearly edgewise, that we can barely see the long line of thin matter in the centre. There is one of most peculiar form, namely an oval, with a regularly formed space of more brilliant matter extending across it in something like the form of a dumb-bell! Surprising to relate, there are more than one bearing a strong resemblance to the form which has been presumed as that of our own star-system, namely, a flattened mass, with a brilliant annular exterior, parting flatwise into two at one part! In the *Magellanic clouds*, a nebulous object in the southern hemisphere, there is one remote star-system (30 Doradûs), described by Sir John Herschel as "consisting of a number of loops united in a kind of unclear centre or knot, *like a bunch of ribbons disposed in what is called a true lover's knot!*" "We are," says an astronomer who possesses eloquence worthy of his noble science, "lost in mute astonishment at these endless diversities of character and form. But in the apparent aim of things near and around us, we may perhaps discern some purpose which such variety will also serve. It seems the object or result of known material arrangements, to evoke every variety of creature, the condition of whose being can be made productive of a degree of durability; and perhaps it is one end of this wonderful evolution of firmaments of all orders, that there too the law of variety may prevail, and room be found for unfolding the whole riches of the Almighty."*

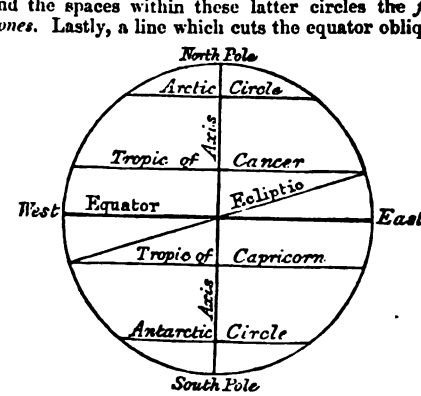
"The vast general distance of these clusters, their distinctness from our own system, and their relative distances, have been determined by the comparative powers of the telescopes employed in observing them. Some of them are distant from us many thousands of times the distance of Sirius, the nearest of our own stars. The astronomer last quoted speaks of the telescope representing us as in the centre of a sphere, whose circumference is 35,000 times as far from us as that star, "and beyond whose circuit, infinity, boundless infinity, stretches unfathomed for ever."

URANOGRAPHY.

Under this term (delineation of the heavens) may be comprehended all those arrangements which have been made by astronomers for artificial representation of the heavens, and for the working of the many mathematical problems of which the heavenly bodies are the subject.

The stars, as they appear in their places on the apparent concave sphere of the heavens, are represented in proper arrangement on the *celestial globe*, which is expressly designed as a miniature of that sphere, but bearing also the fanciful figures assigned to the constellations, and the lines necessary for the working of various problems. It is required that, in the first place, we give a brief description of the terrestrial globe, or similar miniature representation of the earth.

Astronomers, for the convenience of their science, have supposed certain lines to pass through and around the globe. One, passing through the centre, between north and south, is called the *axis* of the globe, from a Greek word signifying axle. The two extremities are called the *poles*, from the Greek word *polos*, signifying a pivot. A line girding the globe in the middle is styled the *equator;* all to the north and south of which are respectively called the northern and southern hemispheres. The circuit of the earth, both in its girth between east and west, and between north and south, is divided into 360 parts, called degrees. At the distance of twenty-three and a half nearly of these degrees from the equator, in both directions, are two parallel lines called the *tropics*, and at the same distance from each pole is a parallel circle, styled in the one case the *arctic*, and in the other the *antarctic* circle. The space between the tropics is called the *torrid zone*, because the sun, being always vertical in some part of that space, produces a greater degree of heat than what is felt elsewhere. The spaces between the tropics and the arctic and antarctic circles are called the *temperate*, and the spaces within these latter circles the *frigid zones*. Lastly, a line which cuts the equator obliquely,



touching upon opposite points of the tropics, is called the *ecliptic*. The ecliptic and equator are called greater

* Views of the Architecture of the Heavens, by J. P. Nichol, LL.D. 1837.

circles, because they cut the earth at the thickest parts; the others are called lesser circles.

A series of lines drawn from pole to pole over the earth's surface (like the division lines of a peeled orange), and cutting the equator at right angles, are called *meridians* (from the Latin word *meridies*, mid-day) or lines of longitude. Every place upon the earth is supposed to have one of these passing through it, although only 24 are described upon the terrestrial globe. When any one of these is opposite the sun, it is then mid-day or twelve o'clock with all the places situated on that meridian, and, consequently, midnight with those on the opposite meridian on the other side of the earth. The exact situation of a place upon the earth's surface, or its latitude and longitude, is determined by means of these circles. They are all divided, as already hinted, into 360 parts, which parts are called *degrees;* these degrees again into 60 equal parts, called *minutes;* the minute into 60 others, called *seconds*, and so on. They are all indicated by certain signs placed behind the figure, and near the top of it—thus, 8° 5′ 7″ is 8 degrees, 5 minutes, 7 seconds. A degree is 60 geographical miles, or about 69 English statute miles; a minute is the 60th part of that; and so on. The *latitude* of a place is its distance measured in that manner from the equator. If it lies north of that line, it is in north latitude; if south of it, in south latitude. There being only 360 degrees in the circumference of the earth, and the distance from the equator to either of the poles being only a fourth part of it, a place can never have more than 90 degrees of north or south latitude. The *longitude* of a place is the distance of its meridian from another, which is called the first meridian. The first meridian is quite arbitrary, and it is a matter of indifference through what point we draw it, provided it be settled and well known which one we adopt, so as to prevent mistakes. Foreigners fixed upon the principal observatories of their respective countries. In Germany, the island of Ferro is generally adopted; in France, the observatory of Paris; and in England, that of Greenwich. Longitude is reckoned either east or west of the first meridian; and 180 is therefore the utmost degree of longitude. Some geographers, however, reckon longitude all the way round the globe. From the shape of the earth, which is flat at the poles, the degrees of longitude decrease as we approach these in either direction. In order to measure latitude, each globe is furnished with a brass meridian circle, on which the degrees are marked. Longitude is measured by a similarly graduated circle, termed the artificial horizon, in which the globe is suspended.

The other great circle, called the Ecliptic, is divided into twelve parts, called signs, which bear the name of the constellations through which this circle passes in the heavens, as shall be afterwards explained. There are other smaller circles which run round the earth parallel to the equator; these are called *parallels of latitude*, because, being every where at the same distance from the equator, the latitude of every point contained in any one of them is the same.

The celestial globe, representing that apparent outer sphere, the sky, in the centre of which the earth seems suspended, is marked by lines similar to those upon the terrestrial globe, each line upon the latter being supposed to have a corresponding line opposite to it in the heavens. Thus, the celestial sphere is divided into the same number of degrees as the terrestrial. The celestial poles correspond to those parts of the heavens to which the terrestrial poles always point. The celestial equator corresponds also to the terrestrial, and is, like it, every where 90 degrees distant from the poles. The equator of the earth thus lies directly under that of the heavens: the ecliptic does exactly the same, and cuts the former also at an angle of 23 degrees 28 minutes.

The place where the ecliptic cuts the equator at the vernal equinox, is called the first point of Aries; and from this point the distance of all celestial bodies eastward and westward of it is measured. This is called their *right ascension*, and corresponds to the terrestrial longitude. Their latitude is determined by their distance from the equator, and is called their *declination*. The declination of the sun or other heavenly body is therefore called north or south declination, according to its proximity to the north or south pole of the heavens. Hence it follows, that when the sun's declination is 10 degrees north, he is vertical at a place whose latitude is 10 degrees north. But the right ascensions do not so correspond with the longitudes, simply because the first point of the constellation Aries does not correspond to the first meridian (Greenwich); and because the longitudes are not measured quite round as the right ascensions are.

The sun, which is always in the ecliptic, has of course no latitude, but he passes through all the degrees of longitude in a year. When any other celestial object has the same longitude as the sun, it is said to be in *conjunction* with him; and when the difference of longitude amounts to 180 degrees, half the circle of the heavens, it is said to be in *opposition* to him. Both these terms are comprehended in that of *syzygy*, which, when applied to any celestial object, means that it is either in conjunction or opposition to him. What is called an *equinoctial colure*, is a great circle supposed to be drawn through the pole of the ecliptic and the points where it intersects the equator. The *solstitial colure* is a similar circle, which passes through the solstitial points at right angles to it. The former colure is a secondary to the ecliptic, and the latter a secondary to both it and the equator. The equinoctial points are Aries and Libra, where the ecliptic cuts the equator. The solstitial points are Cancer and Capricorn; and when the sun is in either of them, he is at his farthest distance above or below the equator.

Allusion has already been made to the constellations, or fanciful figures, marked on celestial globes, to aid in distinguishing the position of the stars. The earliest astronomers seem to have adopted the idea of thus mapping out the starry heavens, being no doubt at first led to do so by the slight resemblances borne by various groups of stars to familiar terrestrial objects. Thus, a group in the northern part of the sky bears some resemblance to an ancient wain, or to a plough—as also to the hinder part of an animal, with its tail extended. Hence, it has been variously called *the Plough*, *Ursa Major*, or the Greater Bear, and *Charles's Wain*—the last term being in honour of the illustrious French king Charlemagne. (In ordinary globes, Ursa Major is

Constellation Orion.

alone marked.) Another group, in the southern heavens, conveys the idea of a man's figure, and has been called Orion, from an early Greek semi-divine hero of that name. Some of the names of the constellations were conferred by Chaldean observers several hundred years before our era: others have been given within the last few ages. Particular stars of large magnitude also bear particular names, generally Arabic, having been affixed by Arabian astronomers, as Aldebaran, Dubbe, Alioth, &c. Arcturus and the group of small stars called the Pleiades, are alluded to in the book of Job, which is well known to be one of the earliest of the scriptural compositions, and probably not less than 3000 years old.

Twelve of the constellations are placed in that part of the heavens which is opposite to the ecliptic in the terrestrial globe; that is to say, the plane of the planetary motions, if extended to the stars, would strike the part occupied by these constellations. This part of the celestial globe is called the *Zodiac*, and these are named the Zodiacal Constellations, or more commonly, the *Signs of the Zodiac*. The zodiac is a zone or belt, extending eight or ten degrees on each side of the ecliptic. It is divided into twelve parts, each of thirty degrees, called the signs of the zodiac. The names of the signs, and the days in which the sun enters them, are as follow:—*Spring signs*—Aries, the Ram, 21st of March; Taurus, the Bull, 19th of April; Gemini, the Twins, 20th of May. *Summer signs*—Cancer, the Crab, 21st of June; Leo, the Lion, 22d of July; Virgo, the Virgin, 22d of August. These are called northern signs, being north of the equator. *Autumnal signs*—Libra, the Balance, 23d of September; Scorpio, the Scorpion, 23d of October; Sagittarius, the Archer, 22d of November. *Winter signs*—Capricornus, the Goat, 21st of December; Aquarius, the Water-bearer, 20th of January; Pisces, the Fishes, 19th of February. These are called southern signs. Within the zodiac are performed the revolutions of all the principal planets.

MECHANICAL ASTRONOMY.

It is the province of Mechanical Astronomy to explain the physical laws which have produced, and which sustain, the arrangements of the bodies occupying space, as well as all the various results of the arrangement and relations of those bodies.

It may in the first place be proper to explain what is meant by a *physical law*. In the operations of nature, certain results are invariably observed to take place as a consequence of certain circumstances. This has suggested to the mind of man, that there is an *order* in all things, by virtue of which they are regulated to the best general purposes, the authorship of the *order* being no doubt the same as the authorship of matter itself, that is to say, referable to the Divine Being. Any particular regulation which we find imposed upon matter, we term a law of matter, or a physical law.

LAWS OF ATTRACTION AND MOTION.

We have first to consider the laws by virtue of which *particles and masses of matter attract each other*, as far as these are concerned in the province of Mechanical Astronomy.

Particles of matter, when brought close together, or within insensible distances, have a tendency to cohere, or stick together, and this operates in all cases, unless there be opposing influences of superior force. It is termed the *attraction of cohesion*.

Particles of matter have also a tendency to move or be drawn towards each other. This is called the *attraction of gravitation*, because it is what the weight or gravity of an object depends upon.

Under the influence of the attraction of cohesion, *particles of fluid matter, when suspended at a proper distance from other objects, arrange themselves round a centre, and take a globular form.* The dew-drop, suspended from the point of a thorn or blade of grass, is a familiar example of matter thus acting. If two such drops are brought close together, they will unite; a new and common centre will be instantly established for both, and they will resolve themselves into a new mass equally globular as before.

Under the influence of the law of gravitation, when any two masses of matter are brought to a proper distance from each other, they will, if there be no sufficient obstacle, rush together, and then remain in union.

We may see this law operating if we take two fragments of cork, no matter how small, and set them afloat on the surface of a cup of water. If kept a considerable way apart, the impediments to their mutual attraction are too strong, and they therefore do not meet. But, if brought within a short distance of each other, we shall observe them begin mutually to exercise an influence over each other, and immediately they will rush together, and so remain.

Material laws are equally ready to act on a large as a small scale, and on a small as upon a large one. The same attraction of cohesion, which causes the tear drawn from our eye by sympathetic feeling to be round, produced the spherical form of the vast orbs which people space. These, being originally fluid masses, gathered themselves round a centre, by the irresistible force of the law of the attraction of cohesion. So also are the planets restrained in their position regarding the central luminary, by the force of the same law of gravitation which causes an apple dropping from a tree to fall upon the ground, or two tea-stalks floating in our evening cup to go together, and range themselves as closely side by side as possible.

We have next to consider the laws which regulate the *motion* of masses of matter.

A mass of matter set in motion upon the surface of the earth, or within the compass of the atmosphere, invariably comes sooner or later to a stop. If we roll a ball along the surface, it goes briskly for a while, then slowly, and finally it stops and remains at rest. What causes it to stop is the resistance it meets with from the roughness of the ground, and the opposing fluid (atmosphere) in which it moves. It is precisely when as much force has acted in opposition to its motion, as was exerted in setting it agoing, that it comes to a pause. Were it not, however, for this opposing force, the ball, once set in motion, would travel on and on for ever.

Just so the orbs of space, once set in motion, go on and on perpetually, there being nothing whatever to oppose their progress. This applies as well to their spinning or rotatory motion on their axes, as to their progress along their orbits. If a top were set a-spinning on a smooth marble tablet, underneath the exhausted receiver of an air-pump, it would be found to keep in motion for a far longer space of time than in any ordinary circumstances, for then there would be comparatively little air to give resistance to its rotation, and the chief opposition would lie in its friction against the tablet. Could the air be entirely drawn away, and the top be made to spin in a state of suspension, it would be in precisely the same circumstances as an orb revolving on its axis in space, and in that case it would never stop as long as all the circumstances remained unaltered.

But the orbitual revolutions of planets are circular —why should they be so? Because these orbs are under the influence of both the law of attraction and the laws of motion. Assuming the nebular hypothesis to be true, the impulse which they originally obtained tended to throw them off in a direct line into space, in the plane of the ecliptic. But the law of attraction prevented this result, and caused them to assume a circular course round the parent orb. They were propelled by the one cause (the centrifugal or centre-quitting force), but restrained by another (the centripetal or centre-seeking force, that is to say, attraction), and they therefore settled into paths where the two forces balanced each other.

To explain. If we take any circular body, say a

common grinding-stone, and, having first put a few pieces of clay upon its rim, cause it to revolve quickly in a horizontal manner, it will be found that the pieces of clay, one after another, fly off in straight lines from the rim. The cause of this is, that each particular part of the rim of the grinding-stone, at every instant of its revolution, is describing a straight-forward movement, and has itself, from the revolutionary motion, a tendency to go straight on, and is only kept in its place by being fixed to the rest of the stone. Every bit of clay that flies off, receives, at the instant of its parting, the force of the straight-forward impulse which at that moment affected the part of the rim where it rested; and hence its going off in a straight line. It is to be observed, however, that the earth immediately begins to act upon the flying piece of clay, and draws it downwards to itself in a bending line, its last movements being in fact a part of a circle. This is the power of attraction, which, in this case, is exercised in much greater force by the earth than by the grinding-stone; were the grinding-stone the sole mass of matter near by, and the opposing force of the atmosphere withdrawn, we should see the clay begin to fly round the stone in a circular course.

And this naturally brings us to consider the comparative powers of attraction exercised by different objects. A large mass has a much greater power of attraction than a small one. When two of unequal bulk are brought near each other, we shall only be sensible, perhaps, of the large one drawing the small one to it, and see no attractive power in the small one whatever. In reality, each mass, however small in comparison, exercises a certain degree of attractive power; and this power will depend expressly upon its relative bulk and density, according to fixed regulations of the nicest kind.

One great and important law presides over the attraction which one mass exercises over another. This relates to the *distance* between the two masses. We shall suppose two globes of unequal size. When the small one is removed to as great a distance from the large one as there is space between the surface of the large one and its centre (that is to say, the distance of a semi-diameter of the large one), the attractive force is diminished one-half. When it is removed to twice that distance, or two semi-diameters, the attraction is diminished to a fourth. When it is removed to the distance of three semi-diameters, the force is lessened to a ninth; to four semi-diameters, a sixteenth; to five, a twenty-fifth, and so on; the diminution being always as the squares of the amount of semi-diameters of distance, or these sums multiplied by themselves. The moon is distant from the earth sixty of the earth's semi-diameters; consequently, the attractive power exercised by the earth over the moon is only a 3600th part of what it would exercise at its surface.

In the revolution, then, of a planet round the sun and of a satellite round a planet, there are various forces at work, all of them in the nicest proportion to each other, and to the mass of each body. There is first the amount of motion resulting from the original impulse; then the amount of attraction exercised by the central and larger over the smaller orb—the one pulling outwards and the other pulling inwards, but both in union attended with the result of a circular or revolutionary motion.

Gravity has not the same force at all parts of the earth's surface. At the equator the centrifugal force produced by the rotating motion is greatest; it declines in both directions towards the poles. In proportion as the centrifugal force is greater, the attractive power of the mass of the earth is less, for the first of these forces is directly counteractive of the other. There is of course least attractive power at the equator; and bodies are there drawn with less force towards the centre of the earth than would be found to be the case elsewhere. Yet this difference is not great, for even at the equator the attractive force is 288 times that of the centrifugal. Neither does the difference tell in the weighing of objects, for in that case two equivalents are used, and if a certain object is lighter, so also is the weight put into the opposite scale. The difference was first detected, in consequence of pendulum clocks being found to go slower as they were brought towards tropical latitudes. It was ascertained that the pendulum of a clock which went right at London, required to be one-eighth of an inch shorter (by which means its motion was accelerated) when it was placed upon the equator. This effect, however, is not altogether owing to the increase of centrifugal force, but partly also to the greater distance of the equator from the centre. And it was from a speculation as to the slower movements of pendulums at the equator, that Sir Isaac Newton first conceived the idea of the spheroidal form of the earth, which he ascertained to be of less diameter at the poles than at the equator, as 229 is to 230, or by twenty-six miles.

The orbits of the planets, it has been already seen, are not strictly circles, but rather ellipses, the sun being in each case placed in one of the *foci*, that is, the centre of one end of the ellipse. How should this circumstance affect the revolutionary motion? It might be supposed that, when the planet came to the part of its course where it is nearest to the sun, the attractive force would be greater, and that some derangement might take place. But this is not the case. At that part of the course the planet moves faster than elsewhere, and thus baffles the greater attractive force. This phenomenon is particularly apparent in comets, which have so eccentric an orbit. These bodies move with inconceivably greater speed when near the sun than in the remote parts of their orbits.

It was a discovery of the German astronomer Kepler, in the seventeenth century, that, notwithstanding the increased speed, a revolving orb goes over exactly the same amount of its circuit as when it moves more slowly. Suppose a multitude of lines radiating from the sun, at equal distances from each other, the orb would be found to cross from one to another of these, in exactly the same time, when it was *farthest* from the sun as when it was *nearest*. In scientific language, it describes equal areas in equal times.

Another discovery of Kepler established that there is a relation between the times respectively required by the planets for their revolutions, and their various distances from the sun. At a first glance, we are struck by the fact that the periods of revolution increase more than in proportion to the distances. For example, the period of Mercury is about 88 days, and that of the Earth 365, being in proportion as 1 to 4.15 (or about 4 1-7th), while their distances, respectively 37,000,000 and 95,000,000 of miles, are in the less proportion of 1 to 2.56 (or a little more than 2½); and a similar remark holds good in every instance. If we take the squares of the distances, we arrive at nothing satisfactory, for it considerably exceeds the proportion of the periods. If, however, we take the squares of the periods of two planets, we find they are in exactly the same proportion to each other as the *cubes* of the mean distances. Some may find a difficulty in understanding the nature of this calculation; but its ingenuity and its results form one of the highest boasts of astronomical science. "When we contemplate," says Sir John Herschel, "the constituents of the planetary system from the point of view which this relation affords us, it is no longer mere analogy which strikes us—no longer a general resemblance among them, as individuals independent of each other, and circulating about the sun, each according to its own peculiar nature, and connected with it by its own peculiar tie. The resemblance is now perceived to be a true *family* likeness; they are bound up in one chain—interwoven in one web of mutual relation and harmonious agreement—subjected to one pervading influence, which extends from the centre to the farthest limits of that great system, of which all of them, the earth included, must henceforth be regarded as members."*

* Treatise on Astronomy, 1833.

The solar system, though composed of many different masses distant from each other, is to be considered with respect to other masses as *one mass*, having a centre of gravity, by which its position with respect to other masses is regulated. The nearest stars no doubt exercise the force of gravitation upon it, so as to keep it in its position; and it also acts in the same way upon them. It is therefore not strictly correct to speak of the solar system or any part of it as *suspended* in space, for that term implies a hanging from a fixed point. It is in reality kept at its place by attractive influences exerted all round it by other masses. In like manner, we are to suppose our star-cluster as poised by the same forces in the midst of other clusters; and these again poised by others—an idea which leads us on and on through the fields of infinity, till the mind loses itself in an effort beyond its finite powers, and pauses contented to wonder and adore!

DIURNAL AND ANNUAL MOTION OF THE EARTH.

The earth is to be considered as a globe of nearly 8000 miles in diameter, performing a rotatory motion on its axis once every twenty-four hours. This motion is at the rate of 1042 miles an hour to places at the equator, but only 644 miles at London, and a gradually diminishing amount in places nearer to the poles.

From the situation of the earth with respect to the sun, it necessarily follows that only one-half of its surface should be exposed at a time to the light and heat diffused from that body. This is the case with all the planets. When any one part of the earth is presented to the sun, it is day at that part, and all the other heavenly objects are lost in the blaze of the great luminary. When, on the contrary, any part is averted from the sun, it is dark at that part, and the light of the stars is allowed to tell upon our organs. Each part is thus brought once every twenty-four hours towards the sun; in short, this is the cause of what we familiarly know as day and night.

There is a minute difference between the *civil* or *legal day* and what is called the *sidereal day*. The entire orb of the earth in reality revolves in 23 hours, 56 minutes, 4 seconds, or 3 minutes, 56 seconds, less than 24 hours. This is called a sidereal day, because the earth is then in the same relation to the stars as it was the day before. The fixed stars are so immensely distant from our earth, that its whole orbit is in respect to them but a point; so that no sensible difference is produced by its revolving round the sun. But the sun being much nearer us, any movement made by the earth can be appreciated. The time which elapses from the sun's being on the meridian of any place to its returning to the same spot next day, is exactly 24 hours, and is called an astronomical day. The natural day would always be the same as the sidereal day, if the earth had no other motion than that upon its axis. But in the same time that it has performed one of its daily revolutions eastward, it has also advanced about a degree westward, or in the opposite direction, which is the course it takes round the sun; so that, before the sun can shine exactly upon the same meridian, the earth must make up as it were its lee-way, and this it does in 3 minutes, 56 seconds, the difference of time between a natural and sidereal day. If the earth, then, had no other than its diurnal motion, we should have 366 days in the year.

When any spot on earth comes directly opposite to the sun, it is noon at that spot, and at every place in the same longitude. At the same moment, it is an hour before noon at the meridian of longitude fifteen degrees to the west of the same spot, and an hour earlier for every fifteen degrees farther to the west; because, as the earth moves from west to east, it requires so much time to bring those places to the same point, namely, opposite to the sun. In like manner, it is an hour after noon for every fifteen degrees to the eastward of the spot where it is noon, because at those places the sun has already been for so many hours past meridian. Thus the hour of the day varies in every part of the globe where the longitude or meridian line is different. When it is twelve o'clock noon with us in any particular part in Britain, it will be twelve o'clock at midnight in a corresponding point on the opposite side of the globe, near New South Wales; and the intermediate hours, sooner or later, will all lie in the countries between these two points, exactly according to their position or degrees of longitude.

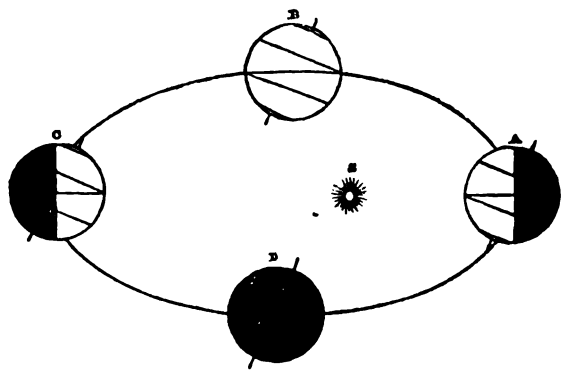


Illustration of the Seasons.

The earth is at a mean distance of 95,000,000 of miles from the sun, and performs its revolution round him in a sidereal year, which is 365 days, 6 hours, 9 minutes, 11 seconds, mean solar time. The earth travels at the rate of 68,000 miles per hour. Its orbit is, as already stated, not a circle, but an ellipse, the sun being situated in one of the foci, that is, not in the centre, but near one of the ends of the oval-shaped figure. Neither does the earth go round the sun in an upright or perpendicular position; its axis is slanting or oblique. The degree of obliquity is 23 degrees 28 minutes. The points at which the ecliptic cuts the equator, are called *nodes*: the period of time at which it does this, the *equinoxes* (a Latin term, signifying equal nights, for the days and nights are then of equal length all over the world). In consequence of this obliquity, during one part of the earth's course the north pole is turned towards the sun, and the south is dark; and during another part of its course, the south pole is turned to the sun, and the north is dark; and this is the cause of the difference of seasons, which will be better understood by referring to the above figure.

THE SEASONS.

Let S represent the sun, and A B C D the earth at various places of its annual circuit; when the earth is at B or D, these are the periods of the equinox, when the line of the equator intersects or cuts through the line of the ecliptic. At this period, one-half of the globe is illuminated from pole to pole, or there is over all the earth an equal day and night of twelve hours. But when the earth has proceeded to A, the pole or axis still keeping the same position, or pointing to one particular place in the starry heavens, it will be turned more directly from the sun; a greater proportion of his rays will shine on any particular spot of the southern half of the globe, and the period of day, or sunlight, will exceed that of darkness by the proportion of the light and shade parted in the circle of the earth. It will be observed, also, that within the circle of the south pole, the sun will shine continually as the earth revolves on its axis, or, in short, to the inhabitants of that part of the globe the sun will never set for several months. When the earth has proceeded on to D, one-half of its annual course is finished, or this is the spring equinox, or equal day and night. At C, again, the earth has arrived at our longest day in summer, when the axis is turned to the sun, and the regions around the pole are in the light for a greater period, while darkness, or night, prevails for a less. It will be seen, too, that now the pole and circle around it revolve in perpetual light; or to the inhabitants of that region, the sun never sets for some months, but they have one continued and uninterrupted day. At the other, or south pole, the same changes take place, only matters are reversed—there it is summer while we have winter, and the winter of the north pole is the summer of the south. In the middle regions of the earth, or around the equator, the sun's place does not suffer a very great change; and, accordingly, there the heat is nearly of the same intensity all the year through; and the length of their days and nights is nearly equal, or nearly the same as at the periods of the equinoxes. But the orbit in which the earth travels round the sun is not an exact circle; it is, as we have already mentioned, an ellipse, and the sun is placed near one end of it, as at the small circle and letter S. In consequence of this circumstance, the sun is much nearer us at one period of the year than another, and this happens in our winter; accordingly, the sun appears about one-thirtieth part larger in January than in June. But in proportion as the earth approaches in her orbit to the sun, her motion is quickened, and she passes over the winter half year in nearly eight days' less time than the summer. It is principally from this circumstance, as well as the shorter period of the day, that although the sun be nearer us in winter, and consequently his power of imparting heat greater, yet the actual quantity imparted is, on the whole, much less in the one season than the other. We have said that the north pole of the earth always points to a particular spot in the heavens; this is not, strictly speaking, correct; the pole or axis makes a circle round the centre of the axis of the ecliptic in a long period of years, and it is this motion that gives rise to the precession of the equinoxes, which will be afterwards described under that title.

ABERRATION OF LIGHT.

Although the most convincing proof of the earth's orbitual motion is not to be found in any circumstance of which the senses can take immediate cognisance, but is afforded by the full development of the planetary system, there is, however, one direct proof of it in a phenomenon discovered by Bradley, an illustrious astronomer. It is called the aberration of light, and is manifested by a small difference between the apparent and true places of a star, occasioned by the motion of light combined with that of the earth in its orbit. Vision, it is well known, arises from rays of light proceeding from any object, and entering the eye; and we see the object in the direction in which the rays have come. If both the body giving forth light and that one which receives it be at rest, the former will be seen in its true place, at least in so far as aberration is concerned; but let either of the bodies move, and this will not be the case. In order to render this plain, suppose a shower of hail to fall perpendicularly upon a number of tubes —say the pipes of an organ; if the organ remain stationary, the hailstones will descend sheer from the top to the bottom, without any deviation right or left; but move the organ in any direction, and they will strike the side opposite to the direction in which the motion is made. Now, it is just in this way that the eye misses the perpendicular ray, and, meeting an oblique one, receives an impression that the star lies in that direction. The object thus appears displaced, and the amount of displacement is *aberration*. The earth travels at the rate of about nineteen miles per second, and therefore is every instant changing its direction. Time is also occupied by light in traversing space, which it does at the amazing rate of 192,000 miles per second; so that also requires to be calculated for by astronomers. The effect of aberration is to make a star apparently describe a small ellipse in the heavens, in the centre of which it would be seen if the earth were motionless. The reader must carefully distinguish between aberration and refraction; their effects are the same—namely, to displace the ray-projecting object—but they proceed from very different causes. Besides these corrections which astronomers have to make in their calculations, there is another, resulting from what is called parallax, which may be as well introduced in this place.

PARALLAX.

The word parallax, in its general signification, denotes change of place; but in astronomical books it has a conventional meaning, and implies the difference of apparent positions of any heavenly luminary when viewed from the surface of the earth and from its centre. The centre of the earth is the general station to which all astronomical observations are referred; the situation of a heavenly body, observed from the surface of the earth, is called the apparent place; and that at which it would be seen from the imaginary place of observation at the centre of the earth, the true or mean place. Hence the altitudes of the heavenly bodies are depressed by parallax, which is greatest at the horizon, and decreases as the altitude of the object increases. This may be rendered very plain, by supposing that two persons placed individually at the end of a straight line, look at a candle removed at, say, 100 yards' distance from them. It is evident that the burning body will appear to be projected upon the wall of an apartment, or any other background, at very different positions to each of the spectators. The angle which this difference of position makes is similar to parallax. The farther they remove from the light, allowing them still to remain at the same distance from each other, the more obtuse the angle would become, and the less the parallax. Thus, the fixed stars, being so far removed from us, when viewed from any two positions upon the earth's surface, are seen at the same place upon the celestial sphere, and hence have no perceptible parallax. It is different, however, with the luminaries belonging to our system; and by this means astronomers have been enabled to estimate the quantity of space which separates us from them. For a complete account of the means by which this is accomplished, we must refer the reader to more elaborate treatises than the present. A general and correct enough idea of it may be formed from the familiar example we have given. In the same manner, suppose two observers, one in the northern the other in the southern hemisphere, at stations on the same meridian, observe on the same day the meridian altitudes of the sun's centre. "Having thence derived the apparent zenith distances," says Sir J. Herschel, whose language would be deprived of clearness were it abridged, "and cleared them of the effects of refraction, if the distance of the sun were equal to that of the fixed stars,

the sum of the zenith distances thus found would be precisely equal to the sum of the latitudes north and south of the places of observation; for the sum in question would then be equal to the meridional distance of the stations across the equator. But the effect of the parallax being in both cases to increase the apparent zenith distances, their observed sum will be greater than the sum of the latitudes by the whole amount of the two parallaxes. This angle, then, is obtained by subducting the sum of the latitudes from that of the zenith distance; and this once determined, the horizontal parallax is easily found, by dividing the angle so determined by the sum of the signs of the two latitudes." It may be observed, that the angles are determined by means of very nice instruments. The parallax thus obtained is called the *daily* or geocentric, in contradistinction to the annual or heliocentric, by which, in general, is understood the difference of place of a heavenly body, as seen from the earth and from the sun; in particular, however, it denotes the angle formed by two lines from the ends of the diameter of the earth's orbit to a fixed star, which, as we have already observed, from the immense distance of the latter, is inappreciable. Some idea of the importance of parallax may be obtained from the fact, that before the sun's was determined, the distance of that luminary from us was not estimated at within 13,000,000 of miles of its true amount. Its parallax is, of course, a very minute quantity, only 8″ 6.

OF SOLAR, SIDEREAL, AND ANOMALISTIC YEARS.

There are three different periods at which the sun may, in different senses, be said to return to the same position—when he returns to the same equinox at which he was before; when he returns to the same point in his orbit, or the ecliptic; and when, being in perigee (least distance from the earth), or apogee (farthest distance from the earth), he comes back to either again; or, which is the same thing, when, having been at a given distance from any of these points, he returns to the same point with respect to them. Each of these may be said to be a completion of the revolution of the sun (strictly speaking, it is a revolution of our own earth round him), and a revolution thus performed is called *a year*. The first and shortest is the equinoctial, solar, or tropical year; for his time of returning from tropic to tropic, they being situations holding the same relation to the equinox for the time being, is obviously the same as that from equinox to equinox. The value of this year is 365 days, 5 hours, 49 minutes, nearly. But although the earth has thus returned to the same equinox, it has not made the entire circuit of its orbit, but must travel a little farther to arrive at the same point it was in a year before. This arises from a backward movement of the equinoctial point. (See "Precession of the Equinoxes.") The second is the sidereal year, which consists, as we said before, of 365 days, 6 hours, 9 minutes, 9 seconds, 6, reckoned in mean solar time, or *a day more*, reckoned in sidereal time. Here, then, there is a remarkable difference between solar and sidereal time, which requires explanation. If the reader will recollect what was said with regard to a solar and sidereal *day*, the discrepancy between the times of the years will become apparent. In the course of twelve months, all the little daily deficiencies, as it were, amount to twenty-four hours, which constitutes the difference between the two years. The sun's apparent annual motion among the stars is performed contrary to the apparent *diurnal* motion of the sun and stars; hence the stars gain every day three minutes fifty-six seconds on the sun, which makes them rise that portion of time earlier every day. In the course of a year, the sun will fall behind the stars a whole circumference of the heavens, or one revolution, which deficiency he must make up to complete the number of days in a year. It is evident, then, that *the sun apparently, or the earth really, turns 366 times round upon its axis; and had it no other motion, there would be as many days in a year. After the earth or sun has completed a sidereal year, before it can finish an anomalistic year, it must describe a farth* 11″ 8 to arrive at its original position in perih latter having moved forward to that amount doing it occupies 4′ 39″ 7, which must be add sidereal period, making the anomalistic year 3(hours, 13 minutes, 49 seconds, 3, in length. periods have their uses in astronomy; but th which mankind are most particularly interest tropical year, or that on which the seasons de which is a compound phenomenon, dependin and directly on the annual revolution of the ear the sun, but subordinately also, and indirectl rotation round its own axis.

MEASUREMENT OF TIME.

Although the sidereal day, from its uniformit adapted for astronomical purposes, yet it is sufficiently marked for the ordinary wants of person but an astronomer ever attends to the tion of a star; on this account, the diurnal r the sun to the same meridian has been un adopted as the measure of time; and this is *civil day*. Most nations reckon the beginning day from midnight, but astronomers count fr to noon. The day thus determined is called t nomical or solar day, and, being regulated by motion of the sun, the time which is measure called true or apparent time. Two causes co render astronomical days unequal; first, the velocity of the sun in his orbit, and, second, the of the ecliptic. A mean astronomical day, wh dependent of any causes of inequality, has been by astronomers introducing into the system t ginary suns. These two fictitious bodies are to move uniformly, the first in the ecliptic, th in the equator; and as the circles are both ec actual motion of each of the bodies is equal. desirous of studying this part of the subject, w recommend a perusal of the article *Astronom* seventh edition of the Encyclopædia Britanni 778, where it is well illustrated. The correction tion, by which apparent time is reduced time, is technically called the *equation of time.* are only four days in the year when the appa mean time are the same, and the equator nothing. In the interval between the first an of these, that is, December 24th and April 15 again, in that between the third and fourth, June 15th and September 1st, the apparent i later than the mean time, or the clock is before in the other intervals which complete the year verse is the case, and the clock is after the su greatest difference between solar and true time to between fifteen and sixteen minutes. T equation are constructed for the purpose of co the differences.

THE MOON.

Next to the sun, the moon is to the inhabi the earth the most remarkable and importar the heavenly bodies. The mean horizontal of the moon is 57′ 43″; and her mean distance earth 236,847 miles. Like the sun, the moon a in the heavens in a motion contrary to that of t Notwithstanding the vast distance she is from little more than one-fourth of the sun's diamet the globe of that magnificent luminary would *twice* include the whole orbit of the moon! various motions; as a secondary planet, it round the earth, which is its primary. Along latter, it revolves round the sun, and it has a motion upon its own axis. Owing to the sun's a movement in the heavens being in the same d with that of the moon, only slower, the latter make up for that slowness in the same way as mentioned with regard to the earth, and the takes constitutes the difference between the sider synodic month or lunation. The sidereal mont days, 7 hours, 43 minutes, 11 seconds, 5, in wh

...ily coincide, but cross or intersect each other; and ...consequence is, that, in general, the moon, when she ...conjunction with the sun, either passes on one side ...the other, and therefore does not intercept the sun's ...s, or produces an eclipse. An eclipse of this kind ...only take place when the earth and moon are in ...junction in that part of their orbits which cross each ...er (called the nodes), because it is then only that ...y are both in a right line with the sun. If the orbit ...the moon were parallel to that of the earth, an eclipse ...ld happen every month. Partial eclipses, again, ...ensue when the moon, in passing the earth, is not ...actly in a line with the sun, but a little on either ...; the consequence of which is, the edge of one side ...the moon only dips into the sun's disc. When the ...is eclipsed, the total darkness is confined to one ...ticular part of the earth, but the lunar eclipses can ...seen from every part of the earth, when the moon ...above the horizon; and both circumstances prove ...t the earth is a good deal lower than the moon. The ...on arrives very nearly at the same situation with ...spect to the earth, after making 223 revolutions, ...ich are performed in eighteen years, of 365 days, ...hours, 7 minutes, and 43 seconds, each; so that, ...er a period of about eighteen years, the series of ...ipses recommences nearly in the same order, a circumstance observed by the ancients. The mean number ...eclipses which occur in a year is about four, and there ...sometimes as many as seven. There must necessarily be two solar eclipses, but it is possible that there ...may not be even one lunar. A remarkable eclipse, ...lled an annular (or circular) solar eclipse, happens ...en the moon being in conjunction with the sun, the ...ge of the latter appears for a few minutes as a narrow ring of light encircling all round the dark disc of ...e moon. A great solar eclipse, visible in England, ...ll take place in March 15, 1858, and a still more ...markable one, when the whole disc will be nearly ...vered, in August 19, 1887.

THE SATELLITES.

The earth, we have seen, is attended in her annual ...rcuit round the sun by one satellite, the moon, which ...volves round her as a centre. Strictly speaking, both ...ve round a common centre of gravity in an elliptic ...bit, the regularity of which is disturbed by their ...utual attractions, so that it is undulated or waved, ...us, ——. The number of undulations in a whole ...volution is, however, only thirteen, so that the de...ation from the ellipse is exceedingly trifling. Jupi...r, Saturn, and Uranus, are all attended by satellites, ...we have seen; and they form, as it were, each of the ...imaries with its attendant moons, a sort of miniature ...stem, entirely similar in the laws by which they are ...verned to the great system to which they all belong, ...here the sun may be termed the primary planet, and ...e primary planets the satellites. Their orbits are ...rcles or ellipses of small eccentricity, the primary ...ccupying one focus. Of these systems, that of which ...upiter forms the head, has been studied with the ...reatest attention. The discovery of Jupiter's satellites ...y Galileo, was one of the first fruits of the invention ...the telescope, and forms a remarkable era in the ...story of astronomy. From it resulted a solution of the ...reat problem of the longitude, and the grand discovery ...the aberration of light. It also established completely ...e Copernican system, and confirmed the laws of Kepler. ...he satellites of Jupiter revolve from west to east like ...ur moon, but they are much less in comparison with ...eir primary than it, whilst their orbits are of smaller ...imensions, and less inclined to the ecliptic of their ...rimary than that of our satellite. The largest of them ...about 3377 miles, and the least about 2068 miles in ...iameter. The satellites of Saturn have been much less ...udied, and have fewer peculiarities. Those of Uranus, ...owever, are remarkable, inasmuch as their orbits are ...early perpendicular to the ecliptic, and in these orbits ...ey are supposed to have a retrograde motion—that ...from *east* to *west*, instead of from west to east, like

the other planetary bodies. No satisfactory cause for this departure (if it be one) from the general rule can be given. It is by accurate observation of the satellites that the densities of the planets, or their weight as proportioned to their bulks, have been ascertained; as also, by watching their frequent eclipses, that the velocity with which light travels from the heavenly bodies to the earth has been brought within our calculation.

PERTURBATIONS.

The name of *perturbations* has been applied to those inequalities in the lunar and planetary motions, which arise from the universality of attraction. Thus, not only does the sun attract the earth, and the earth the moon, but the latter attracts the preceding, and both are again influenced in their movements by the great centre of the system to which they belong. Not only is this the case, but every individual planet in the system attracts, and is attracted by, all the rest, although certainly in a very trifling degree when compared with that exercised by the sun over the whole of them. But in those miniature systems, such as the moon and earth, Jupiter and his satellites, &c., the perturbations thus arising, though insensible in short intervals, become apparent when accumulated, and derange the elliptic motions and relations. The calculation of the effects of these disturbing forces is famous in the history of analysis, under the name of *The Problem of the Three Bodies*. It is so worded, because the Sun, Moon, and Earth, and the Sun, Jupiter, and Saturn, form each separately a system little influenced by the rest. Any thing like an attempt to exhibit the method by which these nice calculations are made, is impossible in this place: of its difficulty, some idea may be formed, when we consider, what is apparent to every one, that the bodies under investigation are continually shifting their relative distances from each other, and altering the intensity of the disturbing force, which evidently must materially increase the abstruseness of the calculation. One of the principal effects produced on our globe by this play of gravitation is called

THE PRECESSION OF THE EQUINOXES.

The equinoctial points, we have already explained, are Aries and Libra, where the ecliptic cuts the equator. They are also termed nodes, and the line which joins the two is called the line of the nodes. The longitudes of the stars, as has been also observed, are counted on the ecliptic from the vernal equinox Aries. Now, if the line of the nodes is invariable, the longitude of the stars will of course remain the same from age to age. But, on comparing the actual state of the heavens with the recorded observations of ancient astronomers, it is perceived that the longitudes of the stars have considerably increased; so that, to explain the circumstance, we must either suppose that the whole firmament has moved in the order of the zodiacal signs, or else that the equinoctial points have gone backwards, or retrograded westward: since these points depend entirely upon the motion of the earth, which was far more likely to be disturbed by some cause or other, than that the countless multitude of stars should have a motion relative to these points. Accordingly, the phenomenon has been explained, by attributing to them a retrograde motion from *east* to *west*, in consequence of which the sun arrives at them sooner than if they had remained at rest. Hence the equinoxes, spring and autumn, and the other seasons, happen before he has completed an entire circuit. This motion, however, is extremely slow, amounting only to a degree in about seventy-six years; so that the equinoctial points will take nearly 26,000 years to make an entire revolution of the heavens. This motion was known in very ancient times, and its discovery is ascribed to Hipparchus, who lived about *140 years before Christ*. The consequence of this *retrograde movement is, that the sun's place amongst the zodiacal signs, at any season of the year, is greatly different from what it formerly was*. The vernal equinox now happens in the constellation Pisces; summer solstice in Gemini; the autumn equi Virgo; and the winter solstice in Sagittarius. nomers, however, still count the signs from the equinox, which always corresponds to the inter of the ecliptic with the equator; and on this acc is necessary carefully to distinguish between the

The cause of precession is to be found in th bined action of the sun and moon upon the protu mass of matter accumulated at the earth's equat attraction of the planets being scarcely sensible. attracting force of the sun and moon upon this s matter, is of a twofold character; one is parallel equator, and the other perpendicular to it. Th dency of the latter force is to diminish the angle the plane of the equator makes with the ecliptic were it not for the rotatory motion of the ear planes would soon coincide; but by this moti planes remain constant to each other. The effe duced by the action of the force in question is, ho that the plane of the equator is constantly, t slowly, shifting its place in the manner we ha scribed.

NUTATION.

The action of the sun and moon in producin cession is various, at different periods of the ye cording to the relative distance of the earth from Twice a-year, the effect of the sun in producin nothing; and twice a-year, namely, at the sol it is at maximum. On no two successive days alike, and, consequently, the precession of the noctial points must be unequal, and the obliqu the ecliptic subject to a half-yearly variation; f sun's force, which changes the obliquity, is va while the rotation of the earth, which countera is constant. By this means, the plane of the e is subject to an irregular motion, which is techi called the *solar nutation*. Its amount, however, exceedingly small, as not to be appreciable by vation. That resulting from the moon's action, ever, is sufficiently so, as to have been discover Bradley before theory had indicated its existence period depends upon the revolution of the n nodes, which is performed in 18½ years, and in that period of time the axis of the world descr small circle in the heavens, about eighteen seco diameter, contrary to the order of the signs. apparent vibratory motion is denominated the tion of the earth's axis. The two phenomena o cession and nutation are intimately connected, or are constituent parts of the same phenomenon dependent upon the same cause, as noticed above Precession. It is impossible here to enter more mi into the subject, or explain it more in detail. F admirable account of it, we refer the reader to schel's Treatise on Astronomy, p. 353. We also direct the inquirer to the same admirable wo further information upon the subject of perturbs comprising all the complicated varieties of motion general, they may be said to arise from the p attractions kept up by the whole of the planets an themselves, they with the sun, and the sun with the distances of the bodies from each other, whi always varying; and the masses of matter, an shape of the bodies, which are invariable. In co ing this part of our subject, we may remark, tha by means of the perturbations of these planets have no satellites, that astronomers have arrive knowledge of their masses. Every planet produ amount of perturbation in the motions of any proportioned to its *mass*, and to the degree of a tage or *purchase* which its situation in the system it over their movements.

GEOLOGY.

Basalt.—The Giants' Causeway.

ION I. EXPLANATIONS—ORDER OF ROCKS.

LOGY (from the Greek, *ge*,* the earth, and *logos*, ɔurse) may be defined as the science which describes solid materials of the earth, the order in which are arranged, the causes which have effected that ngement, and the organic remains which are found hem. The investigations of the science are, in ent circumstances, limited to the external crust of earth.

he solid parts of this crust consist of a variety of tances, to which, whether they be hard or soft, the ı *rock* is applied. Rocks are distinguished both by liarities in their constitution, and peculiarities in r form and arrangement.

t some places the surface of the earth is found to ist of a hard rock, of crystalline or glassy tex-, generally called granite, though subject to a con-rable number of varieties. Granite is never, except eculiar circumstances, found in the form of a layer, ther thick or thin, but generally in large irregular-ɔed masses, and no other kind of rock, except in lly rare and peculiar circumstances, is ever found ɛath it.

t other places the earth's immediate surface is ıd composed of some one of certain kinds of rock less hard in texture than granite, and also of a talline consistence, but always found *in layers or* , generally of great thickness.

t other places, we find, near the surface of the h, rocks of a comparatively soft, and not of a talline consistence, forming also layers or beds, reater or less thickness.

a some places, rock of a very hard kind is found, exactly like any of the above, deposited in irregular forms, and often with the appearance of having penetrated through gaps forcibly made in other rocks.

Finally, throughout the three first classes of rocks, but particularly the two first, there are thin *veins*, of diverse substances, including minerals.

Rocks of the first class are denominated PLUTONIC (from *Pluto*, the god of the infernal regions amongst the ancients), as supposed to have been formed at great depths in the earth, the matter having been originally in a hot and soft state, and afterwards cooled and crystallised slowly, under such enormous pressure as prevented the contained gases from expanding. The term *unstratified* is also applied to this class of rocks.

Rocks of the second and third classes are called AQUEOUS, as composed of matter deposited by water. Those of the second class are more specially named *Metamorphoric* (from the Greek, *metamorphosis*, a transformation), as supposed to have undergone a remarkable change in the course of their formation. It is supposed that the matter of these rocks, derived from rocks of the granitic kind, and suspended in vast oceans, was, when deposited, subjected to a great heat from below, which gave it in its reconsolidation much of that crystalline texture which it had in its plutonic form.

Rocks of the fourth class are denominated VOLCANIC, as being evidently composed of lavas, or masses of fire-melted rocky matter, which have been sent upwards by volcanoes.

Rocks of the second and third classes are likewise called *Stratified Rocks*, as being invariably found in strata or layers. Rocks of the first and fourth classes, as wanting this peculiarity, are distinguished as *Unstratified Rocks*.

The plutonic, and some of the lower metamorphoric rocks, have been also called *Primary*, or *Primitive Rocks*, as either the first formed of all, or formed very early. The upper metamorphoric rocks have in like manner been called the *Transition Series*, as forming a kind of link between the primary and those which follow, and partaking of the characters of both. Of the remainder of the aqueous rocks, a considerable number, being the lower portion, are sometimes called the *Secondary Rocks*, while the upper are named *Tertiary*. *Igneous Rock* is also a various name for the volcanic kind.

When rocks of various classes are seen at or near the same place, it is found that those of the second (except in the extraordinary circumstances alluded to) lie above those of the first; and those of the third above those of the second and first classes. Special kinds of aqueous rock are also found in a certain order above one another—much in the same way as if we were to place a book of many volumes on its side, having previously arranged the volumes according to their numbers, in which case the second would be above the first, the third above the second, and so on. Rocks are thus said to observe an *order of supraposition*—the volcanic kind alone observing no order.

* The *g* is pronounced hard, and the *e* as in *get*.

In some of the upper metamorphoric rocks, and in all those of the secondary and tertiary series, remains of plants and animals are found, showing that when these rocks were formed, the earth had become a scene of vegetable and animal life. The rocks containing these *organic remains*, or *fossils*, are called FOSSILIFEROUS; and the remaining rocks, from their containing no such relics, are called NON-FOSSILIFEROUS.

Above the harder rocks, there are generally layers of clayey and earthy matter, topped by what is called the vegetable soil.

The principal rocks, exclusive of the volcanic, are ranged in the following order, descending from the highest to the lowest:—

Fossiliferous.		SUPERFICIAL.
	Aqueous.	Vegetable Soil.
		Peat.
		Gravel Beds.
		Blue Clay Beds.
		TERTIARY.
		Marl Beds.
		Shelly Millstone.
		Gypsum.
		Coarse Limestone.
		Plastic Clay.
		SECONDARY.
		(*Chalk Group.*)
		Chalk.
		Greensand.
		Weald Clays.
		(*Oolitic Group.*)
		Oolite.
		Sandstones.
		Lias.
		(*New Red Sandstone Group.*)
		Variegated Marls.
		Muschelkalk.
		Variegated Sandstones.
		Zechstein.
		Red Conglomerate.
		Rock Salt.
		(*Carboniferous Group.*)
		Coal.
		Sandstone.
		Shale.
		Mountain Limestone.
		Old Red Sandstone.
		TRANSITION.
		(*Grauwacke Group.*)
		Grauwacke.
		Clayey and Sandy Slates, or Lowest Fossiliferous.
Non-fossiliferous.		PRIMARY.
	Metamorphic.	(*Inferior Stratified Series.*)
		Clay Slate.
		Mica Slate.
		Primitive Limestone.
		Protogine.
		Gneiss.
		(*Granites.*)
	Plutonic.	Granite, in varieties.

Whatever rock, then, appears on or near the surface, if it be not of the volcanic kind, we may form from it some notion of what rocks are, and are not, below. If, for instance, we any where find one of the rocks of the tertiary series, we may deem it almost certain that rocks of the secondary, transition, and primary series, would be found in succession downwards, if we could dig to the proper depth. If we find rocks of the secondary series, it is equally likely that transition and primary rocks are below, and so on. The same conclusions may be formed respecting special kinds of rock of the various classes: if, for instance, we find at the surface a particular member of the secondary series, we may know that certain others of the same series are below. What alone prevents this rule from being of constant application, is the fact, that in no place does every member of the whole series of known exist. Every where some are wanting: in Fran example, transition rocks are in many places wa The rule, nevertheless, is certain with respect rocks which do exist at any place.

The order of supraposition enables us to co with greater certainty as to the absence of all higher in the list than that which we find at th face. If we find secondary rocks at the surfa may be certain that none of the tertiary are the transition, none of the secondary or tertiary; if pri none of the transition, secondary, or tertiary.

SECTION II.—CAUSES OF ARRANGEME

The whole science of geology rests on certain n laws, which are supposed, or have been ascertain be in constant operation, though not always, pe with equally powerful effects. They chiefly r themselves into what have been called *Degradi Elevating Causes.*

Degrading Causes.

The degrading causes are those which refer dissolving and wearing away of the elevated parts earth's surface, and the carrying of these parts dow lower levels. The *dissolving* is brought about by c chemical and mechanical laws, and the *carrying into low levels* is, in the main, a result of the gravitation. Considering that the solid parts earth are in their very nature liable to the opera these laws, it appears quite unavoidable that land be degraded. It is only, however, of late years th degradation of land has attracted any attention. immense scale on which it is constantly taking was first explained in a satisfactory manner Charles Lyell, in his "Principles of Geology," pub in 1830.

The causes of the degradation of elevated lan be considered under three heads—*meteoric*, or connected with the atmosphere; *fluviatile*, or depending on rivers; and *oceanic*, or those in the sea is the immediate agent.

The operation of the atmosphere and its va contents upon the land proceeds in two ways, ch and mechanical. There is a tendency in the h rock to absorb oxygen and carbonic acid fro atmosphere, and to be by that union dissolved. this is an union which is always taking place, tho some places with more conspicuous effects tha where. If the soil on any hill of volcanic rock b mined, we shall first find a fine powdery earth, mixture of earth and splinters of rock; next sp alone, graduating into the hard rock below: suc be considered as an exhibition of the gradual p by which a hard rock is dissolved into powder or under the action of the atmosphere. In Jamaic dissolution of volcanic rock has taken place to depth. In granite, which is considered the har all rocks, one of the component substances (felsp a great tendency to be decomposed, and hence ev rock is sometimes found to have been reduced to or powder to a considerable depth. A hollow blasted through granite, was found by a geologist t been in six years pulverised to the depth of three These are solely *chemical* phenomena. Again, wat forates into minute fissures in rocks. When a fr rives, the water swells, and dislodges parts of the which are precipitated into the lower level. Or meet some clayey veins or strata, hitherto suffici keep various masses together. These veins or being gradually softened by the water, lose their cementing the masses. The upper then fall a slide into a lower level. A *slide* of rock from the berg, in Switzerland, in 1806, filled the bottom vale below, destroying many villages, and caus loss of 800 lives. The impulse of wind and rain surface of rock is also of great efficacy in pulve and wearing it down, sharp parts being rounde

soft parts hollowed. In Sweden there are some large detached masses of granite, containing perforations produced by this cause, some so very large as to admit of a horse and cart passing through them. These effects may be considered as chiefly *mechanical*. As surely, then, as any part of the earth's crust is elevated into the atmosphere, just as certainly is it liable to be worn down and carried into a lower level.

When water collects into channels and follows its well-known tendency to find the lowest level to which it has access, it becomes a mechanical instrument of still greater force for wearing down the land. In its smallest rills, as it descends the mountain side, it cuts into the soil, and carries off whatever particles it can disengage. When gathered into brooks, its operations are still more powerful. When one of these is placed amongst mountains, every heavy shower swells it into an impetuous river, by which large quantities of detached rock and soil are brought down. In the upper parts of the courses of almost all rivers, the greater speed of descent makes up for the smaller volume of water, as far as the power of bringing down stones and soil is concerned. Again, in the lower part of the course, the smaller speed is sometimes compensated by the unevenness of the course; in which case, the water is incessantly driven from one projection of the banks against another, and by that means wears away a great quantity of solid matter. Many facts have been collected to prove the great efficacy of rivers in wearing down the land. The Nerbuddah, a river of India, has scooped out a channel in basaltic rock, 100 feet deep. The river Moselle has worn a channel in solid rock to the depth of 600 feet. Messrs Sedgwick and Murchison give an account of gorges scooped out in beds of the rock called conglomerate, in the valleys of the Eastern Alps, 600 or 700 feet deep. A stream of lava, which was vomited from Ætna in 1603, happened to flow across the channel of the river Simeto. Since that time the stream has cut a passage through the compact rock to the depth of between 40 and 50 feet, and to the breadth of between 50 and several hundred feet. The cataract of Niagara, in North America, has receded nearly 50 yards during the last forty years. Below the Falls, the river flows in a channel upwards of 150 feet deep, and 160 yards wide, for a distance of seven miles; and this channel has manifestly been produced by the action of the river.

Sometimes, during floods, rivers produce great changes in very short periods. A flood caused by the bursting of the barrier of a lake in the valley of Bagness, Switzerland, moved at first with the tremendous velocity of 33 feet per second. From the barrier burst by the waters to Lake Geneva, there is a fall of 4187 Paris feet; the distance is 45 miles; and the water flowed over all this space in five hours and a half. It carried along houses, bridges, and trees; and masses of rock equal in size to houses, were transported a quarter of a mile down the valley.

The matter carried down by rivers is often deposited at their sides, when it constitutes what is called *alluvial land*. Sometimes it is deposited at the bottom of lakes, when it forms what are termed *lacustrine deposits*. In many instances it has been d[illegible] large quantities at the mouths of rivers, givi[illegible] to what are denominated *deltas*. Deltas are so [illegible]ed on account of their resembling the fourth letter of the Greek alphabet. The triangular form of a delta is produced by the river, at a certain point inland, dividing itself into two streams which gradually diverge till they reach the ocean, enclosing the space which constitutes the delta. As an instance of the great amount of new land formed at the mouths of rivers, the delta of the Ganges is 220 miles in one direction by 200 in another. The lower part of this delta, a wilderness inhabited by tigers and crocodiles, is as large as the principality of Wales!

The matter carried down by rivers, and thus deposited, is nothing in amount compared to that transported to the ocean. The quantity of sand and mud brought down by the Ganges to the Bay of Bengal, is in the flood season so great, that the sea is discoloured with it 60 miles from the river's mouth. According to Mr Lyell, the quantity of solid matter brought down by this river every day, is equal in bulk to the greatest of the Egyptian pyramids. According to Captain Sabine, the muddy waters of the Amazon river may be distinguished 300 miles from its mouth.

The constant action of the sea upon the land is strikingly apparent to the inhabitants of coasts. Whole islands have been destroyed by the action of tides and oceanic currents, while the remains of others rise above the surface of the water, like the ruins of some desolated city. Many instances of the encroachment of the sea upon the land have been recorded. An inn on the coast of Norfolk, built in 1805, then 70 yards from the sea, was, in 1829, separated from the coast by only a small garden. A church on the coast of Kent, which in the reign of Henry VIII. was a mile inland, is now only about 60 yards from the water's edge. The island of Nordstrand, on the coast of Schleswig, was, in the thirteenth century, 50 miles long and 35 broad. About the end of the sixteenth century, it was reduced to an area of only 20 miles in circumference. The inhabitants erected lofty dykes for the purpose of saving their territories; but in the year 1634 a storm devastated the whole island, by which 1340 human beings and 50,000 head of cattle perished. Three very small islets are all that now remain to point out the place where once flourished the fertile and populous island of Nordstrand. It is an old notion that Great Britain was once united to the continent of Europe; and the identity in structure of the opposite coasts of the strait of Dover seems to favour the supposition. There is reason to believe that the Island of Ceylon was at one period united to Hindostan. Humboldt is of opinion that the West India islands once constituted a circuit of land which enclosed the Gulf of Mexico.

It thus appears that there are causes in continual operation, for the wearing down of the elevated parts of the earth's crust, and taking the component particles into lower levels. The effects of these causes may be easily traced in the aqueous rocks, many of which are simply deposits of sediment carried by water from high into low places, and subsequently hardened, probably by heat from below and pressure from superincumbent materials. Were such causes not in some way counteracted, dry land could not long exist: all would be taken down and buried in the sea. We find the counteraction in what are termed the *Elevating Causes*.

Elevating Causes.

As Degrading Causes are chiefly owing to water, Elevating Causes are chiefly owing to fire. They are therefore sometimes comprehended under the term *Igneous Agency*.

The manifestations of igneous agency at present observable may be considered under three heads—namely, *volcanoes, earthquakes*, and *gradually elevating forces*. These phenomena may be viewed as the effects of subterranean heat, operating under different circumstances. A volcano may be described as an opening in the earth's surface, bearing the general appearance of a vent of subterraneous fire, and through which smoke, cinders, and ashes, are almost continually issuing, but which sometimes discharges great fragments of rock, and vast quantities of melted rocky matter. The general effect is a throwing up of earthy material from a low to a high level.

Geographers at present reckon about 200 volcanic vents in activity throughout the earth. The greater number of the whole are in a line along the west coast of South and North America. There are many in the islands of the Pacific and Indian Oceans, and in the centre of Asia. In Europe, there are only three in great activity—Ætna in Sicily, Vesuvius in Italy, and Hecla in Iceland. But a vast number of hills throughout France, Britain, and other countries, bear the appearance of having once been active volcanoes. As volcanic action often takes place in the sea, and as there are probably many on land not yet described by geo-

graphers, the number of such vents throughout the earth must be considerably more than 200.

Of the power of volcanoes to throw up large quantities of solid matter, we have many examples. During an eruption of Ætna, a space around the mountain, 150 miles in circumference, was covered with a layer of sand and ashes, generally about twelve feet thick. In the first century, the cities of Herculaneum and Pompeii were buried beneath such a layer of matter by Vesuvius. In 1660, the philosopher Kircher, after accurately examining Ætna, and the ground adjoining its base, calculated that the whole matter thrown out by it at its various active periods, would form a mass twenty times as large as the mountain itself, which is 10,870 feet high, and 30 miles in diameter at the base. From this mountain, in 1775, there issued a stream of lava a mile and a half in breadth, twelve miles long, and 200 feet thick. At an earlier period, there was a stream which covered eighty-four square miles. In 1538, a large hill, since named Monte Nuovo, was thrown up in the neighbourhood of Naples in one night; and in 1759, in a district of Mexico, previously covered by smiling plantations, a sudden outburst of volcanic action, which lasted several months, terminated in leaving six hills, varying from 300 to 1600 feet in height above the old plain.

Of the effect of submarine volcanoes, some interesting observations have been made in recent times. In June 1811, an island was thrown up by volcanic agency, near St Michael's, in the Azores. Columns of cinders rose 700 or 800 feet above the surface of the sea, with a noise resembling that of distant artillery. In the course of a few days, the island was a mile in circumference, and about 300 feet in height, having a crater in the centre, full of hot water. Some time afterwards, it disappeared. In July 1831, a similar island was thrown up, under precisely similar circumstances, in latitude 37° 11′ N., and longitude 12° 44′ E., off the coast of Sicily. It consisted of stones, mud, and cinders, and was of circular form, about a mile and a half in circumference, with a crater of hot water in the centre, 400 yards in diameter. This island, named Sciacca, or Graham's Island, existed so long above the sea as to allow of many persons landing upon it. The Bay of Santorin, in the Greek archipelago, which is about six miles long and four broad, contained, a few years ago, three volcanic isles, the first of which rose about the year 200, the second in 1650, and the third in 1709. In a part of the bay, where the water is generally several hundred feet deep, a shoal has for several years been gradually rising: about 1816, there were fifteen fathoms water upon it; in 1830, there were only three or four; the later accounts reduced it to two and a half. This rising mass was ascertained to be of solid rock, about half a mile in length, by one-third of a mile in breadth; the water deepening suddenly all round it. In 1825, a new island was observed to rise in the Pacific Ocean, about 300 miles north of New Zealand. It consisted of solid rock, had a pool in the middle, and sent forth smoke from several chinks.

Many islands which have long been inhabited by man, bear all the appearance of having risen, in like manner, from the bosom of the deep. The islands of St Helena and Ascension, the Azores, the West India islands, Iceland, and many of the islands in the Pacific, are evidently the produce of volcanic action. "Owhyhee," says M. de la Beche, "is a magnificent example of such an island: the whole mass, estimated as exposing a surface of 4000 square miles, is composed of lava, or other volcanic matter, which rises in the peaks of Mouna Roa and Mouna Kaa, to the height of between 15,000 and 16,000 feet above the level of the sea."

The causes of earthquakes have not as yet been satisfactorily explained, but they are now generally allowed to be connected with volcanic agency. They occur less frequently, and generally with less tremendous effect, in Europe, than in some other parts of the world, those parts where volcanic agency is most active, being also the parts where earthquakes are most frequent and most dreadful. Though their effect is sometimes to cause a sinking of the ground, they may, upon the whole, be considered as among elevating causes. It is conceived that they are produced by gases confined in the molten interior of the earth, similar to those which find vent by volcanoes. Such gases, prevented by local circumstances from escaping, may, it is thought, thus shake the solid ground over a large tract, and even cause it to rise to a certain extent above its former level. The most striking proof which has been adduced in support of this doctrine, is the effect of the earthquake which took place in Chili in 1822. This is part of the continent in which volcanoes are most numerous and active. On the occasion referred to, a shock was felt along the coast for more than 1000 miles. The land for 100 miles along the coast, and backwards to the line of the Andes, was raised above its former level. Along the shore, and for some distance along the bottom of the sea, the rise was three or four feet, so that rocks formerly submerged, and covered with shell-fish, were now exposed above the sea. Old beaches, similar to that now raised, were also observed in parallel lines along the land, the highest being about fifty feet above the ocean.

It has since been observed that old beaches, similar to those in Chili, exist in the neighbourhood of many seas. Along the Firth of Forth, in Scotland, there is one about forty feet above the present level of the sea, and which generally appears as a kind of bank a few hundred yards back from the present shore. In the firths of Clyde and Cromarty, similar beaches are traced. They may always be detected by their terrace-like level, and the presence of sea-shells, rounded pebbles, gravel and sand, such as usually compose beaches at the present day. In some places, old beaches have become conspicuous enough to become objects of popular wonder. In the vale of Glenroy, in Inverness-shire, as also in some neighbouring vales connected with Glenroy, there are three terraces along the sides of the hills, at various heights, which the ignorant people of the district firmly believe to have been roads formed by the hero Fingal for hunting, but which are now shown pretty clearly to have been the shores of quiet estuaries or arms of the sea, similar to many which still exist in the Scottish Highlands—three successive elevations, probably the effect of earthquakes, having elevated the land above the water, so as to leave as many terraces. Among the Alps, and in South America, there are vales marked in exactly the same way as Glenroy.

The existence of a force which *gradually elevates* the land in many places out of the water, was discovered by Mr Lyell. His chief observations were made upon the shores of the Gulf of Bothnia, which he ascertained to have risen several feet in the course of the last century, and a few inches even since 1820.

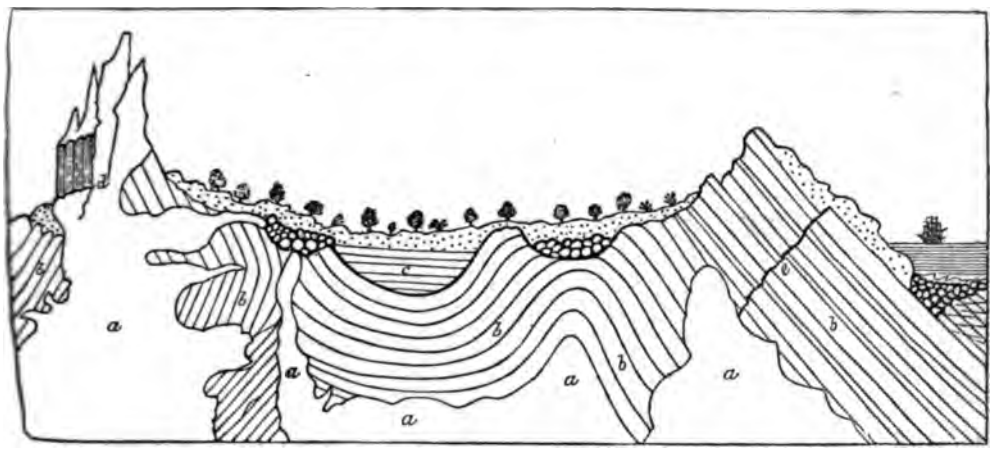
Besides the greater elevating causes arising from subterranean fires, there are some lesser ones of less mysterious origin. The sands deposited on beaches are sometimes blown by winds in upon the land, covering the vegetable soil throughout a large space, and in some instances forming hills of considerable height and magnitude. Some parts of the coast of Holland are thus fenced with ranges of sand-hills, the whole mass of which has been blown back from the sea. On some parts of the French coast, large tracts, once smiling with cultivation, are thus buried under a sterile layer of sand, which is continually advancing, notwithstanding every effort of man. On the coast of Moray, in the north of Scotland, a tract once forming the barony of Culbleen, has been transformed into a sandy tract since the fifteenth century. Such sand-beds readily become converted into strata of sandstone, if saturated with water containing a limy infusion.

In various parts of the world, land is raised out of the sea by the efforts of coral insects. The works of these creatures are seen upon a vast scale in the Pacific, where whole ranges of islands are formed by them. On the coast of New Holland, there is a coral reef which stretches out to a thousand miles in length. The insects do not commence their laborious operations at a great depth below water; from 60 to 100 feet is considered

the utmost extent to which the islands extend downwards. They are generally of a circular or oval shape; and Mr Lyell is of opinion that corals build upon the rims and in the craters of submarine volcanoes. The outer wall of the building emerges first above the waves, enclosing a pool of tranquil water. The seeds of vegetables are either brought there by sea-birds, or wafted by the ocean, and the islands soon become clothed with a mantle of green. The substance of which these islands and reefs are composed, is lime, which the insects secrete from the sea-water, and cement together with a glutinous matter contained in their bodies. Mr Lyell, while surveying the Isthmus of Panama, detached a quantity of these animals, and placed them on some rocks in a shallow pool of water. On returning to remove them a few days afterwards, he found they had secreted stony matter, and had firmly glued themselves to the bottom.

If we consider the operation of the elevating causes, we can be at no loss to understand how we should now see, as composing dry land, and sometimes in very lofty situations, strata which were once at the bottoms of seas; neither will it be surprising, if the irregular nature of volcanic forces is considered, that the strata, so elevated, rarely are found in their originally level position, but in all degrees of inclination, sometimes quite on edge; and even in certain rare instances folded backwards, so as to be upside down.

The changes produced by the united operations of aqueous and igneous agency are in part represented in the subjoined engraving of a supposed section of part of the earth's crust.



a Primary Rock, which has been thrown up, so as to disturb and mix itself with the Secondary Rocks.
b Secondary Rocks, thrown into inclinations and curves by the rising of the Primary Rock.
c Tertiary Formation, deposited in a hollow formed by the disturbance of the Secondary Rocks.
d Basaltic Columns. e A fault or hitch in the strata.
The circles are Boulders or detached stones, rounded by travelling in water, and deposited in hollows formed by water.
The dots indicate beds of gravel, immediately beneath the soil.

Section III.—DESCRIPTION OF ROCKS, AND ORGANIC REMAINS.

PRIMARY.

Granite.

Geologists have been accustomed to describe this as the lowest and oldest of all rocks. Certainly, no other rock is ever found beneath it, except in peculiar circumstances afterwards to be described: if the mass of the earth, therefore, were to be judged of from the small superficial crust with which we are acquainted, granite might appear to constitute the bulk of our planet—a vast nucleus on which all the stratified rocks rested. Geologists are now disposed, under a sense of their limited knowledge, to speak of granite, not as the lowest and oldest of all rocks, but as the lowest as yet discovered, and as one which, though in most of its forms old, is yet sometimes found of recent formation. Granite, in fact, often appears as a volcanic rock, which has been thrown up in a state of fusion through superincumbent strata of all kinds, penetrating into their chinks, and spreading over them on the surface. Even tertiary rocks are found permeated and covered by it—a proof that it has been formed since the deposition of those rocks, which is one of the most recent events in geological chronology. These are the peculiar circumstances in which it may be said that other rocks sometimes lie beneath granite.

Granite, then, may be described as generally forming a basis or bed for all the other rocks—as rising in some places from its unmeasured depths into chains of lofty hills—and as in other places penetrating in veins through superincumbent rocks, and partially covering them at the top. It composes some part of the mountain ranges of Cornwall, Cumberland, and the Scottish Highlands; and veins of it are found upon or near the surface in many other parts of England and Scotland.

Three substances usually enter into the composition of granite; namely, (1) *quartz*, a grey glassy substance, composed of the oxygen of the atmosphere in union with one of the newly discovered metallic bases (silicium); (2) *felspar*, also a crystalline substance, but usually opaque and coloured pink or yellow, composed of sandy and clayey matter, with a small mixture of lime and potash; (3.) *mica*, a silvery glittering substance, which divides readily into thin leaves or flakes, and consisting principally of flint and clay, with a little magnesia and oxide of iron. In some granites, instead of mica, we find *hornblende*, a dark crystalline substance, composed of alumina, silex or flint, and magnesia, with a considerable portion of the black oxide of iron. Such granites are called *Syenite*, from having been first found in the island of Syene. Other varieties are—*Serpentine*, in which there are dark spots like those on the skin of the snake (hence the name), and *Porphyry*, of which the distinguishing peculiarity is its containing little angular pieces of felspar enclosed in the mass.

In man's economy, granite is a rock of great importance. Its uncommon hardness makes it very suitable for the erection of buildings where great durability is desired. Hence, the docks of Liverpool, Waterloo Bridge in London, and many other buildings of a similar nature in England, have been composed of it, notwithstanding that it had to be brought from a great

distance. Nearly the whole city of Aberdeen is built of the granite found in the neighbourhood; and the houses have consequently a glittering appearance when the sun is shining upon them. This stone is also the component material of Memnon's head and Pompey's Pillar, two ancient structures in Egypt.

Inferior Stratified Series.

Above the granite, in its ordinary position, lies the inferior stratified series, consisting mainly of two kinds of rock, gneiss and mica-slate, with alternating strata of hornblende rock, quartz rock, eurite, talcose slates, chlorite slates, and argillaceous slates; of all of which it may be said that they follow no determinate order. These rocks are of the same materials as granite, in a very slightly modified form, and they are nearly as crystalline in their texture. Geologists also find in many places that the granite *passes* into them—a term expressing a blending of the characters of rocks at the line of their juncture. These two facts have led to the supposition, that the inferior stratified rocks were formed from the materials of the granite, disintegrated by mechanical or chemical means, and washed into the beds of vast oceans, where, on their deposition, they were reached by the high temperature of the interior, and thereby reconsolidated in a crystalline form. To account for the rocks composed exclusively of one of the materials of the granite, we may suppose a chemical separation of those materials.

The most prevalent rock of the series is *gneiss*, a compound, like granite, of quartz, felspar, mica, and hornblende, and so highly crystalline as to be sometimes scarcely distinguishable from granite. A great portion of the Highlands of Scotland is composed of strata of gneiss, of vast thickness. It is remarkable for its richness in veins of the metals. *Mica-slate*, or *schist*, the next most prevalent rock of the series, is composed of mica and quartz. It is the surface rock of many extensive tracts of country. *Quartz rock*, which we may suppose to have been formed by a chemical separation of that component of granite, is also a prevalent rock. Humboldt takes notice of a mass of it in South America, more than 9500 feet in thickness. The round white pebbles, or candy stones, so often found on sea-beaches, and in the beds of rivers, are pieces of quartz rock. *Eurite*, of which felspar is the main ingredient, and *hornblende rock*, the chief element of which is signified by its name, may also be accounted for by a chemical origin.

Clay-slate is the geological term for the well-known stone with which houses are roofed. It is, as its name imports, composed mainly of clay—a substance too liberally diffused amongst the ingredients of granite, to admit of any wonder as to its being found in a nearly distinct state in this rock. Mica-slate and clay-slate are *fissile* in their structure—that is, capable of being split into very thin plates: hence the utility of slate, as a material for covering houses. But a curious diversity exists in this respect between mica-slate and roofing slate. In the former, the *cleavage*, or direction in which it splits, is in the same line as the stratification; but in roofing slate, the cleavage is always more or less transverse. What makes the latter circumstance the more remarkable—when strata of roofing slate are found, as often happens, contorted or wavy, the direction of the cleavage is in one straight line through them all, indicating that the influence which produced the cleavage in that rock took effect after the whole had been laid down, and after, by some subsequent accident of pressure, they had been forced into a wavy direction. Probably this phenomenon is of an electric nature. Clay-slates are found in great abundance in Cornwall and in the Scottish Highlands. A fine kind makes the slates used at school, and from a kind still finer are cut the pens used for writing on school-slates.

In the inferior stratified series, there occur a few small beds of limestone, sometimes called *Saccharine Limestone*, from its resemblance to refined sugar, and sometimes *Primitive Limestone*, from the period of its occurrence in the series. In Greece and Italy this rock has been subservient to the developement of national talents, the highest that have ever been known of their class, for it is the marble from which the works of the Greek and Italian sculptors have been formed. In the geological history of our globe, its first appearance in the ascending series of rocks is an event of no small consequence, for limestone strata form a large proportion of the superior formations, and the manner in which they have been formed has engaged much attention. Limestone is the *carbonate of lime*, that is, a combination of the earth lime (itself an union of the metal calcium and oxygen) with carbonic acid (this being, again, an union of oxygen with the elementary substance carbon). Carbon is the largest element in the composition of vegetable and animal substances, and this its first appearance in the structure of rocks is of course a point of much interest, more especially as it is generally concluded that many of the superior limestone strata have been entirely formed of animal remains. We are thus tempted to surmise that the formation of the limestone beds of the inferior stratified series marks some early and obscure stage of organic existence on the surface of our planet. No distinct remains of plants or animals have, indeed, been found in this series; and it is customary to point to the next upper series, in which both do occur, as the era of organic life. Yet many geologists are of opinion that the inferior stratified rocks might have contained such remains, though the heat under which the rocks seem to have been formed may have obliterated all trace of such substances.

TRANSITION.

Grauwacke Group.

All the rocks hitherto described are of crystalline texture, and, apparently, chemical phenomena have attended their formation. In the group we have now arrived at, traces of mechanical origin and deposition become apparent; but still a few strata resembling the preceding occur throughout the lower parts of this series, as if the circumstances under which the earlier rocks were formed had not entirely ceased. Hence the term *transition* for the series, as implying a passing from one state of things to another.

The rocks forming the lower part of this group, and which are sometimes separately classed as the *Lowest Fossiliferous Group*, are an alternation of beds of chlorite, talcose, and other slates, resembling those of the inferior stratified series, with beds of clayey and sandy slate, of apparently mechanical origin, and in which a few fossils are found. It thus appears that the cessation of the chemical origin of rocks, and the commencement of organic life, are events nearly connected; and it has thence been surmised that the temperature of the earth's surface was now for the first time suitable to the production and maintenance of organic things. At the same time, the alternation of the rocks teaches us the instructive fact that the change was not direct or uniform, but that, for some time, the two conditions of the surface superseded each other. This is conformable with a general observation, which has been made by an eminent geologist,* namely, that, however sudden changes may have taken place in particular situations, a general change of circumstances attending rock formations is usually seen to have been more or less gradual. The few fossils found in this part of the series are, as far as ascertained, the same as those of the next higher rocks.

These are a series of arenaceous and slatey rocks, of evidently mechanical origin, intermixed with small beds of limestone, in which that peculiarity is less distinct, the whole being termed more particularly the *Grauwacke* group. The general composition of the grauwacke indicates its having been formed of a fine *detritus* (matter washed from other rocks), and its having been deposited slowly; but it sometimes has fragments of rock, of various sizes under that of a man's head, imbedded in it, and it occasionally *passes into* conglomerates. The limestones mixed with the grauwacke

* I. e. De la Beche—Manual, 471.

eds are larger and more numerous than in the preceding group, indicating an increase of the causes which roduced carbonic acid. Fossils are also more numerous in them than in some of the other beds.

The grauwacke forms the immediate surface in many arge districts in Scotland, England, France, Germany, nd North America, showing that, at the time of its ormation, "some general causes were in operation over large portion of the northern hemisphere, and that he result was the production of a thick and extensive leposit enveloping animals of similar organic structure ver a considerable surface."*

Fossils of the Grauwacke Group.

The fossils of the grauwacke (a few of which extend o the clayey and sandy slates immediately below) are f both plants and animals. Amongst the plants are lgæ, or sea-weeds, showing that seas like the present ow existed. Some land plants are also found, but of he simpler structures; as *filices*, or ferns; *equisetaceæ*, class of plants of the character of the mare's tail† of ur common marshes; and *lycopodiaceæ*, a class of the haracter of our club mosses.‡ All of these land plants re *monocotyledons*, that is, produced from seeds of a ingle lobe, and therefore *endogenous*, that is, growing rom within—timber plants being, on the contrary, the produce of two-lobed seeds, and growing by exterior layers. The *flora* of this era thus appears of a very simple kind, indicating the existence only of marshy and damp grounds.

The animals are also, in general, of a humble and simple kind. There is abundance of those creatures (*Polypi*) resembling plants, which fix themselves on the bottom of the sea by stalks, and send forth branch-like arms for the purpose of catching prey, which they convey into an internal sac, and digest. At present these creatures abound in the bottoms of tropical seas, where they live by devouring minute impurities which have escaped other marine tribes, and thus perform a service analogous to that of earth-worms and other land tribes, the business of which is to clear off all decaying animal and vegetable matter. But the class of creatures found in greatest numbers in the grauwacke series of rocks are *shell-fish*, possibly because the remains of these creatures are peculiarly well calculated for preservation. All over the earth, wherever grauwacke rocks are found, shell-fish are found imbedded in vast quantities, proving that shell-fish were universal at the time when that class of rocks were formed. In a work entitled "Remarks on the Geology and Mineralogy of Nova Scotia," by Abraham Gesner,§ it is stated that they abound to a surprising degree in the valuable iron ores which in that province accompany or form part of the grauwacke rocks. In reference to the beds at Nictau, the author says, "The impressions made by marine organic remains in the ore and slate are extremely beautiful and distinct. Millions of shell-fish, of the molluscous and crustaceous tribes, which once enjoyed a perfect animal existence, have been swallowed up by this ore, where their remains and perfect likenesses are yet to be seen in the same natural and symmetrical beauty they possessed when alive."‖ At new Canaan, another of the places where these rocks are dug, the *lily encrinite*, a remarkable example of the radiated tribes, is found. It is so called from its resemblance to a lily resting on its stalk; "it is supposed," says Mr Gesner, "that the animal resided in the bottom of the flower; and those portions of it which were moveable, stood stretched out like arms to seize its prey. In the grauwacke at New Canaan, this animal appears like the lily with its capsule and petals closed. It is often of large dimensions; some were procured during our last visit to their stony graves, as large as water-melons, although in general they are much compressed, and have been flattened by the weight of the rock resting above them when in a soft state. This species of radiated animals is now altogether extinct, and many ages have passed since a living species could be produced. It has never been discovered in any of the strata placed above the new red sandstone; and as it does not appear but in a few of the older strata, the whole race must have enjoyed but a short existence."

Among the shell-fish of the early seas, a few of the most remarkable kinds are described by geologists as *ammonites* and *nautili*. These fishes have been found in great varieties of size; but one peculiarity pervades them all, that the greater part of the shell is a curve containing air-cells, while the animal itself resided in the outer portion, as if a human being were to have a house consisting of a long row of chambers, and live only in the front room. The ammonite receives its name from its resemblance to the curved horn on the head of the statue of Jupiter Ammon. It has been an animal of wonderful character and habits. Some of them have been of a minuteness scarcely visible, and others four feet wide. They are found over the whole surface of the earth. The economy of this animal destined it to live in general at the bottoms of deep seas, but to be able to rise occasionally to the surface. While it lived in the outer part of its wreathed shell, the interior curls were hollow, containing air, so as to make it of nearly the same weight with the element in which it lived. As the pressure of the water at the bottom of a deep sea would break in the plates of any ordinary shell, as it does a bottle when one is lowered to a considerable depth, the shell of the ammonite has been strengthened by a curious kind of internal arch-work, so as to be able to resist the weight of the incumbent fluid. This arch-work so completely meets all human ideas of ingenious contrivance for the purpose which it was destined to serve, as to form one of the most striking examples of that adaptation of means to ends which is universal in the works of nature, and which is so well fitted to impress the conviction of a great designing First Cause. The weight of the ammonite was so nicely adjusted to an equality with the water, that its filling with air or water a small central pipe which runs through the whole extent of the curve, was sufficient to make it rise as high or sink as low as might suit its inclination.

The *Trilobites* are another of the early species which deserve particular notice. Their remains, like those of the ammonites, are universal over the earth. It is curious that, while they have long ceased to live, other genera or kinds of the same class of creatures (*Crustacea*) still exist, and serve to afford some knowledge of their habits. The trilobite had a head and eyes, below which there was a body of no great length, covered with shelly plates in the manner of a lobster's tail, and terminating in a narrow rounded point. It is supposed that it had soft paddles to make way through the water, which have not of course been preserved. But the most interesting feature in the trilobite was its eyes, of which several specimens have been obtained in a nearly entire state. The eye of the trilobite has been formed with 400 spherical lenses in separate compartments on the surface of a cornea projecting conically upwards, so that the animal, in its usual place at the bottoms of waters, could see every thing around. As there are two eyes, one of the sides of each would have been useless, as it could only look across to meet the vision of the other; but on the inner sides there are no lenses, that nothing may, in accordance with a principle observable throughout nature, be thrown away. It is found that in the serolis, a surviving kindred genus, the eyes

§ Halifax, Nova Scotia. Gossip and Coade, 1836.

‖ "They are almost all bivalves," he adds, "of the genus *unonia*, although some were obtained resembling the *nautilus discus* and *planorbis equalis*." He elsewhere mentions that the encrinite and trilobite, which in Germany are said not to have been found in rocks earlier than the mountain limestone, are found in the iron ore and clay-slate of Nova Scotia.

are constructed on exactly the same principle, except that they are not so high, which seems a proper difference, as the back of the scrolis is lower, and presents less obstruction to the creature's vision. It is also found that in all the trilobites of the later rocks, the eyes are the same.

This little organ of a trivial little animal carries to living man the certain knowledge, that, millions of years before his race existed, the air he breathes, and the light by which he sees, were the same as at this hour, and that the sea must have been in general as pure as it is now. If the water had been constantly turbid or chaotic, a creature destined to live at the bottom of the sea would have had no use for such delicate visual organs. "With regard to the atmosphere," says Dr Buckland, "we infer that, had it differed materially from its actual condition, it might have so far affected the rays of light, that a corresponding difference from the eyes of existing crustaceans would have been found in the organs on which the impressions of such rays were then received. Regarding Light itself, also, we learn, from the resemblance of these most ancient organisations to existing eyes, that the mutual relations of Light to the Eye, and of the Eye to Light, were the same at the time when crustaceans endowed with the faculty of vision were placed at the bottom of the primeval seas, as at the present moment."

A few bones of fishes have been found in the grauwacke; but some obscurity rests on the point. If such really have been the case, the remains of this era may be said to include specimens of all the four divisions of the animal kingdom—radiated, jointed, pulpy, and vertebrated animals, or radiata, articulata, mollusca, and vertebrata.

SECONDARY.

Carboniferous Group.

This is a very comprehensive group, embracing not only the coal strata, and the beds of sandstone, limestone, and others alternating with these, but two great formations on which the proper coal group may be said to rest (though in a state of intimate connection), named the Mountain Limestone, and the Old Red Sandstone.

The *Old Red Sandstone* is a rock composed of grains of sand, cemented by the oxide of iron (the same substance as common iron rust), which gives it its red colour. Its strata are sometimes thin, and sometimes of the thickness of several thousand feet.

Mountain Limestone is an abundant rock. It forms the surface of a vast portion of the central counties of Ireland. Quick-lime, for the improvement of soil, and the preparation of the mortar used in building, is made from mountain limestone. It is also used in many countries as a building stone. Great caverns often occur in this rock, being probably owing to some chemical phenomenon in its formation. One of these at Mitchelston, in Ireland, comprehends passages several miles in extent. Mountain limestone is frequently traversed by beautiful veins of calcareous spar, at times appearing to be principally composed of organic remains, while at others not a trace of these can be detected. This rock is of various colours, but mostly grey, varying in intensity of shade. In some situations it affords good marble, which is susceptible of a considerable degree of polish. From its durable nature, it is likewise used in building. That stupendous work, the Breakwater at Plymouth, is composed of it. Many valuable veins of lead ore occur in this rock.

The superior group more particularly called *Carboniferous*, and variously termed the *Coal Measures*, is composed of beds of that mineral, often very numerous, alternating with beds of sandstone, shale, limestone, ironstone, and some other substances. As many as forty beds of coal exist in the neighbourhood of the town of Newcastle. The great utility of this mineral as a domestic fuel, and in the arts, gives it a high im-

portance, and happy is the country in which it exists in considerable quantity. In a merely geological point of view, it is equally important. This rock is a mass of vegetable matter, which has accumulated in certain situations, and afterwards covered over and pressed into a hard consistence other strata.

Two suppositions have been formed respectin circumstances under which coal was formed. Acc to one, the vegetable matter must have grown dense forest for many years; then the land must sunk, and become the basin of a lake or estua which situation rivers would wash into it mu sand, which would cover over the vegetable mass form superincumbent beds of shale and sanc respectively. Then, the ground would be once elevated, or sufficiently shoaled up, to become a scene of luxuriant vegetation. When the veg had again become accumulated, the land would be sunk, and become once more the basin of a la which case the beds of mud and sand might ag formed by rivers. And this alternating process i posed to have taken place as often as there are b coal to be accounted for. The other theory is, tha some great estuary or lake, rivers coming from rent quarters would bring the various matters fo the strata of the carboniferous group, a river fro direction bringing the mud which would form another from another direction the vegetable m which would form coal, and so on, each deposit pe taking place through the efficacy of some local ci stances, while the causes for the other deposits temporarily suspended. At present great diffic beset both theories.

Fossils of the Carboniferous Group.

In this group of rocks, about 300 species of have been discovered, all of them now extinct. two-thirds of them are ferns; the others cons large *coniferæ* (allied to the pine), of gigantic *l diaceæ*, of species allied to the *cacteæ* and *euphorb* and of palms. Most of these plants probably exist coal beds, forming in fact their sole composition the peculiar nature of this mineral renders it di to detect them by examination.* Thin slices, how have been examined by the microscope, and the table structure has then been detected, where no ext trace of it was visible. In cannel coal, a kind pecu hard, the vegetable structure is observed throu the whole mass, while the fine coal retains it o small patches, which appear as it were mechan entangled. Slate and cannel coal often bear d impressions of plants. The plants are such as in hot moist situations; and it is therefore pres that a climate of that nature existed at an early p where coal is now found, even in Melville's I which is within the polar circle. Dr Hutton th that the vegetables must have been carbonise charred) by heat; but Dr Macculloch contend good grounds, that the change has been effected by water and pressure, and that by these agents is capable of being converted into coal.

Large fragments of trees are often found in the and sandstone beds of the carboniferous group, frequently in the former than in the latter. As with fossil substances, they are converted into material in which they are imbedded, but preserv their original lineaments, except that they are gene changed from their original round to a flattened the result of the pressure they have sustained. most instances, these fragments of trees appear to been transported from a distance, and laid down zontally in their present situation; but some have found with their roots still planted in their native of mud, and the stems shooting upwards through se superior beds of various substances. Even in coal beds, there are found stems of trees in their nal vertical position; the roots being imbedded in beneath. In these instances, we must suppose the to be on the spot where the living tree was pla grew, and died. In the Bensham coal seam, in Jarrow coal-field, a few years ago, there was foun upright tree of the kind called lepidodendra, thir

* Maclaren's Geology of Fife and the Lothians.

and a half feet wide at the base, and thirty-nine feet high, the branches at the top being also entire: the lepidodendron, a common plant in this group, is so called from the scaly appearance of its stem, the scales being the roots of the leaf stalks. Various fossil trees have been discovered in the sandstone beds of the carboniferous group, at Craigleith and Granton, in the county of Edinburgh. One found in Craigleith quarry was twenty feet long, three feet in diameter, with scars where the branches had been torn off, and was ascertained, by microscopic inspection of slices of the trunk, to have been a conifera of the genus *Araucaria*, of which living species exist in New Holland.

The animal remains of the carboniferous group are much the same as those of the grauwacke—zoophytes, mollusca, crustacea, and a few fishes.

New Red Sandstone Group.

This group of strata, lying above the carboniferous group, comprehends rocks called—

The *Red Conglomerate*, formed of pieces of earlier rocks, some rough, some smoothed by rolling, all caked together;

Zechstein, a kind of limestone, abounding in Germany;

Red or Variegated Sandstones, a group of many varieties of colour, and principally of argillaceous and siliceous consistence, much used for building in England and other countries;

Muschelkalk, a limestone varying in texture, but most frequently grey and compact; not found in Britain or France, but occurring in Germany and Poland;

Variegated Marls—beds of rock of different colours, red, blue, and grey, composed of the remains of shell-fish.

To this group also belong beds of *rock salt*, of which many exist in England, particularly in the county of Chester. Rock salt is a crystalline mass, forming regular strata, sometimes of the thickness of many feet. The substance is rarely pure, but generally contains some portion of oxide of iron, which gives it a red colour. It is dug like coal and other minerals, and when melted and subjected to proper purification, is sold for domestic purposes.

Fossils of the New Red Sandstone Group.

The vegetable remains of this group are much the same as those of the preceding; but in the department of animal life, when we arrive at the Muschelkalk, or Shell Limestone, we find a great difference, leading to a supposition that, at this era of geological chronology, "circumstances had arisen changing the character of marine life over certain portions of Europe; that certain animals abounding previously, and for a great length of time, disappeared never to reappear, at least as far as we can judge from our knowledge of organic remains;"* and that certain new forms of a very remarkable kind were added.

The new creatures were of such a class as we might expect to be the first added to the few specimens of fish which had hitherto existed: they were of the class of Reptiles, creatures whose organisation places them next in the scale of creation to fish, but yet below the higher class of animals which bring forth their young alive and nourish them by suck (mammalia). The earth was as yet only fit to be a partial habitation to creatures breathing its atmosphere and living upon its productions. It is supposed to have been under so high a temperature as to be unsuitable for mammalia: the lands which existed were probably low and marshy, with a hot, moist atmosphere, so as to present an appropriate field of existence only for lizards, crocodiles, and creatures of similar character. It is also to be supposed that the land was at this period undergoing frequent changes and convulsions, so that only a class of creatures to which submersions and deluges were matters of indifference, could reside upon it without a greater waste of life than was part of the Great General Design. The Reptiles, which first begin to appear in the Muschelkalk, continued to flourish while a great succession of other rocks was forming: throughout the whole of the Secondary Formation, there were few other land animals. In fact, the world must have been in the possession of reptiles for a many thousand times longer period than it appears to have yet been in the possession of man. "When we see," says Dr Buckland, "that so large and important a range has been assigned to reptiles among the former population of our planet, we cannot but regard with feelings of new and unusual interest, the comparatively diminutive existing orders of that most ancient family of quadrupeds, with the very name of which we usually associate a sentiment of disgust. We shall view them with less contempt, when we learn, from the records of geological history, that there was a time when reptiles not only constituted the chief tenants and most powerful possessors of the earth, but extended their dominion also over the waters of the seas; and that the annals of their history may be traced back through thousands of years antecedent to that latest point in the progressive stages of animal creation, when the first parents of the human race were called into existence."*

The Reptiles of this early age were peculiar both in size and in structure. Some, which inhabited the seas, resembled lizards, but were of gigantic size; others, designed for land as well as sea, resembled the crocodiles which still exist in warm climates.

One of the most remarkable kinds (genera) has received the name of *Ichthyosaurus* (Fish Lizard), of which seven species or varieties have been discovered. The head is like that of the crocodile, composed of two long slender jaws, provided with a great number of teeth (in some cases 180), and eyes of great size (in one instance, the cavity for the eye has been found to measure fourteen inches), while the nostril, instead of being near the snout, as in the crocodile, was near the anterior angle of the eye. The body was fish-like, arranged upon a long spinal column, which consisted of more than a hundred joints, and to which a series of slender ribs was attached, and terminating in a long and broad tail, which must have possessed great strength. The whole length of some specimens of the Ichthyosaurus was about thirty feet. Instead of the feet, with which the lizard and crocodile are furnished, the Ichthyosaurus had four paddles like those of the whale tribes, fitting it to move through the waters in the manner of those animals. It had also a construction of the sternum or breast-arch, and of the fore paddles, similar to that found in the Ornithorynchus, an aquatic quadruped of New Holland, and evidently designed, as in the case of that animal, to enable it to descend to the bottoms of waters in search of food. While the Ichthyosaurus, then, is mainly allied to the lizard tribes, it combined in itself the additional characters of the fish, the whale, and the Ornithorynchus. "As the form of the vertebræ by which it is associated with the class of fishes seems to have been introduced for the purpose of giving rapid motion in the water to a lizard inhabiting the element of fishes, so the further adoption of a structure in the legs, resembling the paddles of a whale, was superadded, in order to convert these extremities into powerful fins. The still further addition of a furcula and clavicles, like those of the Ornithorynchus, offers a third and not less striking example of selection of contrivances, to enable animals of one class to live in the element of another class."† Such deviations cannot be considered as monstrosities; they are perfect adaptations of a creature to its purposes in the theatre of being. Only the spine of the Ichthyosaurus as yet existed in other animals. Its head, its paddles, and its breast-arch, were all detached parts of future animals. How strange to reflect, that some of these contrivances were allowed to become extinct, and, as it were, lost to nature, and ultimately, after a long interval, were revived in connection with new creatures!

The internal structure and the modes of living of the

* De la Beche's Manual, 408.

* Bridgewater Treatise, i. 167.

† The same, i. 185.

Ichthyosaurus, have been in a most unexpected manner made clear by the discovery of the half-digested remains of animals found within them or in their neighbourhood. It appears that the creature possessed a large stomach, extending throughout nearly its whole body, and that it lived upon fish and other reptiles, including its own kind. It must have occasionally devoured creatures several feet in length. Masses of the refuse of the Ichthyosaurus, petrified as hard as the finest marble, and well known to geologists under the name of *coprolites*, are found to be marked spirally, like the refuse of certain species of sharks and dog-fish, the intestinal gut of which winds greatly, in order that it may take up the least possible room. We thus obtain a distinct idea of the nature of a very important part of the bodily economy of this long extinct race of animals. The stomach occupied so large a space in their bodies, for the reception of large quantities of food, and it was at the same time so necessary that the speed of the animal in pursuit of prey should not be clogged by a very large or long body, that the smaller intestines had been, by a wise arrangement of nature, reduced nearly to the state of a flattened tube, coiled like a cork-screw around itself; "their bulk being thus diminished," says Buckland, "while the amount of absorbing surface remained nearly the same as if they had been circular."

The name *Plesiosaurus* is applied to another highly remarkable reptile of gigantic size, which inhabited the world before the days of mammalia. A particular species has been described as having a body and paddles which bore some resemblance to those of the Ichthyosaurus, the former being more bulky, and the latter longer and more powerful. At the end of a long neck, like the body of a serpent, was a head resembling that of a lizard, but also partaking of the characters of the head of the crocodile and Ichthyosaurus. The tail was short. The backbone of this creature, and the neck and tail continuing it, contained in all about ninety vertebral pieces, thirty-three of which composed the neck; and the vertebræ are found to be of a less fish-like structure than those of the Ichthyosaurus, and not nearly so well calculated for rapid motion. The ribs describe a large circle, and, being formed in four parts, seem to have been designed to contain a capacious set of lungs, and to rise and fall as the lungs were inflated or emptied: in this respect they resemble the ribs of the chamelion, whose changes of colour are now known to be occasioned by the varied depth of its inspirations. It is therefore surmised, though with little confidence, that the Plesiosaurus was also capable of changing its colour —a power which must have been highly necessary to a creature of its unwieldy character, both to enable it to elude the quicker and equally voracious Ichthyosauri, and that it might more readily ensnare and seize the creatures designed to be its prey. The Plesiosaurus probably lived chiefly on or near the surface of the water, breathing the air, and dabbling for prey like a duck or swan, but might also be able to descend to the bottom, and even to move, though awkwardly, upon land. One part of its organisation is peculiarly striking, as foreshadowing a structure of a more important kind. The paddles, which may be considered an advance or improvement upon the fins of fishes, are at the same time the type of the legs of quadrupeds and of the arms and limbs of man. The fore-paddle consists of scapula (shoulder blade), humerus (shoulder), ulna (upper bone), and radius (lower bone), succeeded by the bones of the carpus and metacarpus, and the phalanges, equivalent to those which compose the palm and fingers of a human being. The hind-paddle presents femur, tibia, and fibula, succeeded by the bones of the tarsus and metatarsus, and five toes. Thus "even our own bodies, and some of their most important organs, are brought into close and direct comparison with those of reptiles, which at first sight appear the most monstrous productions of creation; and in the very hands and fingers with which we write their history, we recognise the type of the paddles of the Ichthyosaurus and Plesiosaurus."*

* Buckland's Treatise, i. 213.

Of the Crocodile family found in abundance in this class of rocks, the *Iguanodon*, of which remains have been found in the fresh-water formation at Wealden in England, may be cited as a specimen. It was a huge animal, resembling the present Iguana of South America, which chiefly lives upon plants and seeds. The smallest part of the thigh-bone of an Iguanodon was found to be twenty-two inches in circumference, and much larger than that of any existing elephant. Species resembling the present Gavial of the Ganges have also been found. It may fairly be inferred from the present habits of the Gavial and other kinds of Crocodiles, that at the time when the extinct species flourished, the world must have contained many low shores and savannahs, fitted for the residence of such creatures. Some parts of England are thus proved to have had at one time shores of lakes and estuaries resembling those of the Ganges, the Nile, and other waters in hot countries, and consequently a much higher temperature than at present.

But perhaps the greatest wonder of the Reptile Age, was the creature called the *Pterodactyle*. Mainly a reptile of the lizard kind, its body possessed some of the characteristics of the mammalia; it had the wings of a bat, the neck of a bird, and a head furnished with long jaws full of teeth, so that in this last part of its organisation it bore some resemblance to the crocodile. Eight species of the Pterodactyle which have been found, vary from the size of a snipe to that of a cormorant. The eyes were of enormous size, apparently enabling it to fly by night. From the wings projected fingers terminated by long hooks, like the curved claw on the thumb of the bat. These must have formed a powerful paw, wherewith the animal was enabled to creep or climb, or suspend itself from trees. It has been conjectured that the Pterodactyle would chiefly live on flying insects, of which, it is important to notice, several varieties existed at the same time, their remains being found in the same rocks. And it is likely, from the size of the eyes, that it searched for prey by night as well as by day. But it has also been argued, from the great length and strength of the jaws, and the length of the neck, that the Pterodactyle did not live solely upon flies, but likewise sought for fish in the manner of our own present sea-birds.

Tortoises also existed during this age, as is proved by the marks of their feet on sheets of sandstone, and by their remains. But as yet no animals of a higher class had appeared upon earth—for the remains of certain creatures of the Opossum family, found in the oolite at Stonesfield, near Oxford, stand as yet so solitarily, that we cannot consider them as proving that mammalia were added to reptiles. With, then, flocks of Pterodactyles flying in the air in pursuit of huge dragon-flies; gigantic crocodiles and tortoises crawling amidst the jungles of low, moist, and warm shores, and such monsters as the Ichthyosaurus and Plesiosaurus swarming on the surface of the sea, while its depths were peopled by infinite varieties of fish, shelled and vertebrated; we can form some faint idea of what sort of world it was while the strata between the coal and the chalk were in the course of being deposited.

Oolitic Group.

Next in order is a group which derives its name from a kind of limestone conspicuous in it, called oolite. Oolite, again, is named from its resembling the eggs or roe of fish. The oolite group comprehends, besides oolite itself, various alternating clays, sandstones, marls, and limestones.

Oolite is a carbonate of lime, intermixed with other ingredients. The oolites found at Bath, Portland, and Purbeck, are much esteemed in building. In the *oolite* which occurs over a considerable part of western Europe, there is a general uniformity of structure. In other parts of the world it differs very considerably, especially in its mineralogical character; and when this is the case, in order to determine whether certain rocks belong to the group or not, recourse has been had to the organic remains contained in them. In some parts

of Europe these are very abundant, and in other places the reverse. To account for this difference, it has been supposed that in those parts of western Europe where they are abundant, shallow seas existed; while in those places, such as Italy and Greece, where few remains are found in the formation, the waters were deep.

With respect to the deposition of the oolitic group, nothing very satisfactory can be said. Whence came the immense quantity of carbonate of lime, is a question not easily answered. To account for it by springs, similar in size and saline contents to those we now see, appears to be unphilosophical. Many limestones are nearly altogether composed of organic remains; and this has led to a theory, that these animals extracted lime from the water, leaving their shells, produced through millions of generations, to be gradually converted into limestone. Notwithstanding all that we can suppose was deposited from springs and organic bodies, "there remains," says de la Beche, "a mass of limestone to be accounted for, distributed generally over a very large surface, which requires a very general production, or rather deposit, of carbonate of lime contemporaneously, or nearly so, over a great area."

In the oolitic group is comprehended by some geologists an important subordinate group, named the *lias*, which may be generally described as an argillaceous and calcareous deposit, sometimes the clayey material predominating, and sometimes the limey.

Fossils of the Oolitic Group.

In this group are found, as in some of the preceding, *algæ* (sea-weeds), *equisetaceæ* (mares' tails), *filices* (ferns), and *coniferæ* (allied to the pine). The animal remains are nearly the same as in the preceding group, but of a greater variety of species.

Cretaceous or Chalk Group.

This group, the uppermost of the secondary series of rocks, is so named from the beds of chalk of which it is mainly formed. Chalk is a carbonate of lime. It is very plentiful in England; and at Dover and other places, it runs along the coast in cliffs and mountains of considerable size. Nodules or small masses of flint, sometimes containing remains of shells and animals, are abundant in chalk, and it is extremely difficult to account for their presence there. In the lower parts of the English chalk deposits, the flints disappear, becoming gradually more rare in the passage downwards. From this circumstance, the group has been sometimes divided into *upper*, or *chalk with flints*, and *lower*, or *chalk without flints*. But this characteristic does not universally prevail. Beneath the chalk there is a rock called *greensand*, which in Normandy is used as a building stone. An argillaceous deposit called *gault* also occurs; it is of a bluish-grey colour, and is frequently composed of clay in the upper, and marls in the lower part.

The cretaceous group, taken as a mass, may in England, and over a considerable portion of France and Germany, be considered as cretaceous in its upper part, and sandy and clayey in its lower part. The group is extensively distributed over Europe; and M. de la Beche makes the following observations upon its mineralogical character in general:—"Throughout the British islands, a large part of France, many parts of Germany, in Poland, Sweden, and in various parts of Russia, there would appear to have been certain causes in operation, at a given period, which produced nearly, or very nearly, the same effects. The variation in the lower portion of the deposit seems merely to consist in the absence or presence of a greater or less abundance of clays or sands, substances which we may consider as produced by the destruction of previously existing land, and as deposited from waters which held such detritus in mechanical suspension. The unequal deposit of the two kinds of matter in different situations would be in accordance with such a supposition. But when we turn to the higher part of the group, into which the lower portion graduates, the theory of mere transport appears opposed to the phenomena observed, which seem rather to have been produced by deposition, from a chemical solution of carbonate of lime and silex, covering a considerable area." M. de la Beche goes on to state, that no springs, or set of springs, could have produced the great deposits of chalk which cover immense surfaces. "But," says he, "although springs, in our acceptation of the term, could scarcely have caused the effects required, we may perhaps look to a greater exertion of the power which now produces thermal waters for a possible explanation of the observed phenomena." Mr Lyell states, that chalk must have originated in the sea, in the form of sediment, from tranquil water; and that, before the existence of the rocks above, it must have been raised in large portions above the water, and exposed to the destroying power of the elements.

Fossils of the Cretaceous Group.

In this group, *confervæ* and *naides* were added to the vegetables; to the animal remains some fishes are added, but the number of the saurian reptiles is diminished.

A species of rocks, called the *Wealden rocks*, occur beneath the lower green sand of the English series, and are characterised by the presence of terrestrial and fresh-water remains in abundance.

TERTIARY.

The cretaceous group was at one time thought to be the uppermost; but it was in time discovered that, in several places, and particularly under the sites of the cities of London and Paris, there existed a still higher group or series, to which the name supra-cretaceous was therefore at first given, afterwards changed to the Tertiary Formation or Tertiary Series.

The tertiary rocks appear as if they had been formed in great hollows or basins in the former surface: hence it is customary to speak of the *London Basin*, the *Paris Basin*, &c. The Paris Basin has been well explored, and is supposed to present a good example of the Tertiary Formation. It consists of five subordinate groups or series, whereof the first, third, and fifth, appear, from the organic remains found in them, to have been formed in fresh water, and the second and fourth in sea water. They have been thus arranged in an ascending order:—

1. Fresh-water formation,	Plastic clay. Lignite. First sandstone.
2. Marine formation,	Calcaire grossier.
3. Second fresh-water formation,	Siliceous limestone. Gypsum, with bones of animals. Fresh-water marls.
4. Second marine formation,	Gypseous marine marls. Upper marine sands and sandstone. Upper marine marls and limestone.
5. Third fresh-water formation,	Millstone without shells. Shelly millstone. Upper fresh-water marls.

Plastic Clay.—This substance has been so named from its easily receiving and preserving the forms given to it, and, from possessing this property, it is used in the potteries. It rests upon a surface of chalk, which is very irregular, and furrowed out so as to present an alternation of hills and valleys. This clay is of various colours; and above it, and separated by a layer of sand, there frequently occurs another bed of clay, which scarcely can be called plastic. It is black, sandy, and sometimes contains organic remains. In this deposit, considered as a mass, it is stated that organic remains do not occur in the lower parts. In the central portion, fresh-water animals commonly occur, and in the upper part there is a mixture, sometimes an alternation, of marine and fresh-water remains.

Calcaire Grossier, as its name implies, is composed of a coarse limestone, which is employed for architectural purposes. It is frequently separated from the plastic clay beneath by a bed of sand, and it alternates with argillaceous or clayey beds. The animal and vegetable remains enclosed in it are numerous, and generally the same in corresponding beds, presenting considerable differences when the beds are not identical.

Siliceous Limestone is sometimes white and soft, sometimes grey and compact, and penetrated by silex. It is often full of cells, which are occasionally large, and communicate with each other in all directions.

Gypsum and Marls.—Gypsum is a crystalline substance composed of lime, in union with sulphuric acid and water. Its colours are grey, white, and yellow; but different varieties of it have different hues. It was used in ancient times for window glass. The gypseous rocks consist of an alternation of gypsum and limey and clayey marls; these marls are also found in thick beds above this alternation. These beds are considered as having been deposited in fresh water, and above them are others, which, from their organic remains, are believed to have been deposited in the sea.

Upper Marine Sands and Sandstones.—These consist of irregular beds of siliceous sandstone and sand. The animal remains in the lower portion of these beds are broken and very rare. In some situations, however, millions of small bodies have been found. These beds are occasionally covered with a species of rock which is filled with marine shells.

Upper Fresh-Water Formation.—This rock sometimes consists of white calcareous marls, at others of different siliceous compounds; from one of these, millstones of a celebrated kind are formed. They are sometimes charged with shells and petrified wood.

The supracretacious rocks of England are commonly known by the names of plastic clay, London clay, Bagshot sands, the fresh-water formations of the Isle of Wight, and the crag of Norfolk.

Plastic Clay.—This deposit, though it occasionally contains an abundance of clay, employed for various useful purposes, is also mixed with beds of pebble, irregularly alternating with sands and clay. It thus differs from that of Paris, but it agrees with it so far as it reposes upon an uneven surface of chalk. The organic remains are principally marine, but those of fresh-water and terrestrial animals are intermingled with them.

London Clay.—The great argillaceous deposit which underlies the London district, has obtained this name. It is of a bluish or blackish colour, and contains a portion of calcareous matter; beds of sandstone are also said to be occasionally present in it. This clay varies considerably in thickness, sometimes from seventy-seven to seven hundred feet. Besides the remains of a great variety of shell-fish, those of a crocodile and turtle have been found; masses of wood have also occurred in this stratum.

Bagshot Sands.—These rest upon the London clay, and consist of layers of various kinds of sands and marls containing fossil shells.

The Isle of Wight and London formations, although differing considerably in the nature of their deposits from those of Paris, present such an analogy in the organic remains of some parts of the group, that we are justified in referring the deposit to the same epoch, local circumstances and accidents having determined their characters.

It may be observed, that volcanic agency has been very active during the formation of this group. Ætna, it would appear, has for a long series of ages given forth its igneous products, and a considerable portion of these rest upon supracretaceous rocks. In central France, where extinct volcanoes are numerous, this is still more evident: a volcanic mass, called the Plomb du Cantal, appears to have burst through and fractured the fresh-water limestones of the Cantal, which, according to Mr Lyell, are equivalent to the fresh-water deposits of Paris, and some of those in England.

Fossils of the Tertiary Series.

As yet, no distinct traces of the higher forms of organisation have appeared. No vestiges of the mammiferous or sucking animals, either terrestrial or aquatic, which form so large a portion of the existing animal kingdom—no marks of the bird class, now so extensive and important—and scarcely any token of such marine and fresh-water shells and other productions as abound

present time—have been discovered either in
er or later secondary strata of the globe. The
I indeed almost unique, cases of supposed
to this statement, have all been found capable

of such explanations as leave the general truth unshaken.

In the Tertiary Formation we find a striking wonderful change of appearances. These strat rich beyond all that go before them in animal ren At the time of their formation, the aptitude o earth for the maintenance of organic life had increased, and was continually increasing, as the approached when man himself and the higher o of being were to become its inhabitants. The wa paved, it will be seen, for this consummation, b same regular and progressive steps which charact the organic changes of the geological eras alread scribed.

From their relative position, and from the or remains contained in them, geologists have bee abled to distinguish, in the tertiary series of strata great eras of formation. One of the most strikin novel features of these formations consists, as al mentioned, in the repeated alternations of *fresh-* deposits with marine ones; a circumstance establ beyond question by the character of the fossil and bones found respectively in these deposits the oldest of the tertiary eras, the term Eocene plied: the second is called the Miocene period third, the Older Pliocene; and the fourth and lates Newer Pliocene; names founded on the resp proportions which their fossil shells bear to she existing species. In each of these periods is inclu great fresh-water, as well as a marine, formati deposit. Of the living beings which flourished in of these periods, we shall endeavour to give som count, commencing with the most ancient, the Eo

After the chalky formation, a period of conside repose seems to have ensued, during which a portion of the existing continents, and in especi hollows and basins on their surface, appear to been the site of vast lakes, rivers, and estuaries. these was deposited the first great fresh-water f tion of the Eocene period. While this deposi going on, the globe, no longer an entire stagnant m but as yet incapable of affording much support t restrial animals, was tenanted only by such quadr as live beside rivers and lakes. Nearly fifty e species of mammalia, chiefly of this character, discovered by Cuvier in the first Eocene fresh-wate mation. The most of these belonged to the class P dermata (*thick-skinned* animals), of which the ele the rhinoceros, the hog, the tapir, and the horse remarkable existing examples. This class of Pach matous animals, it may be observed, only includes thick-skinned creatures as have no more prom mark to distinguish them than their *skins*. The and river-horse, for example, are thick-skinned then they are *amphibious*, and that is a more prom distinction. The extinct animals to which we now resemble the tapir more than any of the other P dermata. Among these extinct creatures, the worthy of notice are the Palæotherium, the Anopl rium, the Lophiodon, Anthracotherium, Cherapot and one or two other families, including, some of not less than eleven or twelve distinct species. mammiferous families had some general traits of r blance, and the description of the great *Palæoth* may afford an idea of the main features of all. animal was of the size of the horse, or about fou and a half in height to the wither. It was more and clumsy in its proportions than the horse; the was more massive, and the extremities thicke shorter. On each foot were three large toes, rou and unprovided with claws; the upper jaw was longer than the under. The tapir, and partly, als hog, if large enough, would closely resemble the Palæotherium. "The Palæotheria (says Buck probably lived and died upon the margins of the existing lakes and rivers, and their dead carcases have been drifted to the bottom in seasons of fl The other mammiferous families of the first E formation, were all, like the Palæotheria, herbivo and had, it is probable, similar habits.

The number of animals, aquatic and terrestrial, whose remains are found in the other deposits of the Eocene period, is immense. In some gypsum (sulphate of lime) quarries of that era, scarcely a block can be opened which does not disclose some fragment of a fossil skeleton. The following list of the animals found in the gypsum quarries of Paris, will show sufficiently how very different from the gigantic reptiles of the secondary eras were the creatures that tenanted, and found fitting sustenance on, the earth during the Eocene period. Besides various extinct Pachydermatous families, there were found extinct species of the wolf and fox, of the racoon and genette, among the Carnivorous tribes; of the opossum; of the dormouse and squirrel; nine or ten species of birds, of the buzzard, owl, quail, woodcock, sea-lark, curlew, and pelican families; fresh-water tortoises, crocodiles, and other creatures of the Reptile class; and several species of Fishes:—all of these animals, be it remembered, being *extinct species* of existing families, exclusive of the Pachydermatous animals, and the Fishes, which were extinct species of *extinct families*. The occurrence of the birds mentioned in the preceding list of the Eocene animals, forms (says Dr Buckland) "a remarkable phenomenon in the history of organic remains." The number of fossil shells found in the Eocene formations is estimated by Mr Lyell at 1238. As in the case of the terrestrial creatures, few of these shell-fish are of recent or existing species, not more, at the utmost, than 3½ in every hundred. We do not, moreover, recognise in the strata now under consideration, those prodigious accumulations of *microscopic* shells, as they are called from their extreme minuteness, that distinguish the formations of the secondary or preceding ages. One small piece of rock, of the ages in question, has been found to contain above ten thousand chambered shells, though the whole weighed only an ounce and a half. In fact, great beds of secondary limestone seem to be almost wholly composed of microscopic shells. Such phenomena are not presented in the Eocene or subsequent tertiary formations. The shells of these periods, as has been already observed, approximate more to the character of recent or existing species.

In the Eocene period, then—the earliest of the Tertiary eras—we perceive, for the first time, the existence in the animal kingdom of a similar order to that which now prevails, indicating that the earth and its atmosphere were in a certain degree assimilated to their present condition. It seems impossible, however, to agree with Mr Lyell in the subjoined remark on the Eocene era:—"When we reflect (says that writer) on the tranquil state of the earth, implied by some of the lake-formed and sea-formed deposits of this age, and consider the fulness of all the different classes of the animal kingdom, as deduced from the study of the fossil remains, we are naturally led to conclude that the earth was at that period in a perfectly settled state, and already fitted for the habitation of man." Several strong arguments might be adduced against this conclusion, but we shall only refer to one objection—the temperature. From the frequency of the remains of crocodiles and other tropical reptiles in the Eocene formations, and from the frequency of palm-leaves and trunks, as well as from other evidences, the atmosphere may be regarded as having been still at too high a temperature for human comfort. Volcanic action, moreover, appears to have been of very common occurrence.

The second, or Miocene period, however, of the Tertiary ages, brings us a step nearer to the existing condition of things. A strong proof of this is derived from the shells alone of the strata of this period. Whereas only three in the hundred Eocene fossils were of recent species, of the Miocene shells we find eighteen in the hundred to have existing representatives. Along with the mammalia, also, of the Eocene period, we find that the Miocene deposits present us with the earliest forms of animals existing at the present time. In Dr Buckland's Bridgewater Treatise, a table is given, exhibiting the animals found at Darmstadt, in a bed of sand referable to the Miocene period. In this list are mentioned two skeletons of the Dinotherium, a large herbivorous animal, called by Cuvier the Gigantic Tapir; two large Tapirs; Calicotherium—two large Tapir-like animals of this name; two Rhinoceroses; Hippotherium, an animal allied to the horse; three Hogs; four large Cats, some as large as a lion; the creature called the Glutton; Agnotherium, allied to the dog; and Machairodus, an animal allied to the bear. From this list the reader will perceive the gradual approach in the Miocene animals to existing species. The largest of the terrestrial mammalia yet discovered belongs to the period now under notice; it is the Dinotherium, or Gigantic Tapir, already mentioned. No complete skeleton has yet been discovered; but from the bones found, Cuvier and others imagine the animal to have reached the extraordinary length of eighteen feet. The most remarkable peculiarities of its structure consist in two enormous tusks at the end of its lower jaw, and the shoulder-blade, which resembles that of a mole, and is calculated to have given the power of digging, or other free movement, to the fore-foot. It seems probable that this stupendous creature lived in fresh-water lakes, and had the half terrestrial half aquatic habits of the walrus or river-horse. The tusks might be used in digging up roots and plants, and also in sustaining the head on banks during sleep, or in pulling the body out of the water, as the walrus uses a similar pair of tusks. "In these characters (says Buckland) of this gigantic, herbivorous, aquatic quadruped, we recognise adaptations to the lacustrine (lake-covered) condition of the earth, during that portion of the tertiary periods, to which the existence of these seemingly anomalous creatures seems to have been limited."

In the Miocene period, the seas became the habitation of numbers of marine mammalia, consisting of Dolphins, Whales, Seals, Walrus, and the Lamantin, or Manati. Few of these animals were of the same species as those which exist at present, but the differences were far from being great or remarkable. This circumstance, as well as the considerable number of fossil shells identical with existing ones, exhibits an approach in the character and tenantry of the Miocene seas to the present state of things in these respects. The discovery, also, of true terrestrial mammalia, as the Rhinoceros and Hog, in the Miocene formations, shows, that since the era of the gigantic reptiles, no slight portion of the earth's surface had assumed the condition of dry land, fit for the support of the common herbivorous creatures. At the same time, the occurrence of such animals as the Dinotherium in the Miocene strata, proves, as Dr Buckland remarks, that many regions were still covered with great lakes and estuaries.

It now remains to inquire into the nature and peculiarities of the animals characterising the Pliocene age, which, for convenience, has been arranged into two periods, the Older and Newer Pliocene, the latter of which immediately preceded the formation of the Diluvial layer constituting the present superficial matter of the globe.

Proceeding from the deepest seated portions of the terrestrial crust upwards, we find a progressive approach, as has already been stated, in the character of the animal remains to the existing varieties of animal life. A remarkable proof of this is presented by the shells of the Pliocene periods. Whereas only eighteen in the hundred of the Miocene shells were of recent species, in the Older Pliocene from thirty-five to fifty, and in the Newer Pliocene not less than from ninety to ninety-five in the hundred, are identical with shells of existing species. This great change is accompanied by the disappearance of the Palæotherian family and others, which formed the most striking animal remains of the periods immediately preceding. In place of these extinct species of *extinct* Pachydermatous or thick-skinned families, we observe in the strata of the Pliocene periods a vast number of remains of *existing* Pachydermatous families, such as the elephant, the rhinoceros, and the hippopotamus, though these remains belong to varieties that are now extinct. The first traces also now appear of Ruminant animals—of oxen, deer, camels,

and other creatures of the same class. But though it is of importance to notice the existence of such remains in the Pliocene ages, in order to exhibit the progressive approach to the present state of things in the animal kingdom, it is in the huge and extraordinary creatures, now no longer to be seen on the face of the earth, that the interest of such an investigation as the present chiefly lies. The Pliocene ages are not less rich in those wonders than the periods already described, and to this portion of the subject we shall now turn our attention.

The enormous creature called the *Great Mastodon*, belongs to the Pliocene era. Of all the fossil animals whose skeletons have been found *complete*, or nearly so, the Mastodon is the largest. Much confusion has existed relative to this animal's true character, many naturalists regarding it as an extinct species of the elephant, and others holding that it approached nearer to the hippopotamus. Cuvier, however, determined it to be the head of a distinct family, comprehending several other species. It is about one hundred and twenty years since remains of the Mastodon were first discovered in America, and vast quantities of them have been since found in the same region, buried chiefly in marshy grounds. One skeleton nearly complete was dug up on the banks of the Hudson in 1801, and it is from this that a correct knowledge of the animal has been principally derived. In height, the Mastodon seems to have been about twelve feet, a stature which the Indian elephant occasionally attains. But the body of the Mastodon was greatly elongated in comparison with the elephant's, and its limbs were thicker. The whole arrangement of the bony structure resembled that of the elephant, excepting in one point, which Cuvier regarded as of sufficient consequence to constitute the Mastodon a different genus. This was the cheek-teeth, which are divided, on their upper surface, into a number of rounded, obtuse prominences, arranged not like the elephant's, but like those of the wild boar and hippopotamus; whence it is concluded, that, like the latter animals, the Mastodon must have lived on tender vegetables, roots, and aquatic plants, and could not have been carnivorous. The lower jaw of the skeleton found on the Hudson is two feet ten inches in length, and weighs *sixty-three pounds*. Like the elephant, the Mastodon had two tusks, curving upwards, and formed of ivory, and, in the opinion of Cuvier, it had also a trunk of the same kind with the former animal's.

Altogether, making an allowance for several additional feet of length, the larger specimens of the elephant must be considered as varying little from the Great Mastodon. Though not an aquatic animal, the Mastodon, as has been mentioned, appears to have lived, like the hippopotamus, on aquatic vegetables, and this is corroborated by the marshy situations in which its remains are generally found in the greatest profusion. The Indians of Canada had observed these bones, and believed them to belong to a peculiar animal which they called the *father of oxen*. There have been found many bones, belonging, it is conceived from the teeth and other peculiarities, to smaller varieties of the Mastodon. No complete skeletons, however, having been yet dug up, it is unnecessary to attempt any detailed description of what these minor Mastodons must have been. From the immense number of Mastodon bones which have been dug up in various parts of the earth, and particularly in the New World, we must conclude that at no distant period of time the terrestrial surface was extensively peopled by these enormous creatures. How strange would the spectacle have been, could a human being have been set down in the midst of the great marshes of the ancient world, and beheld these animals browsing in hundreds, all like moving mountains of living matter!

Another creature, belonging to the later Pliocene ages, if not indeed to the era of the Diluvial formation, *has been* discovered in America, both north and south. *This is the Megatherium, an animal* more widely removed *in character from any* existing creature, than *any of the other fossil remains* that have been yet observed. The Megatherium was discovered to the end of the last century. A skeleton, almost e was found nearly at one hundred feet of depth, in vations made on the banks of the river Luxan, s leagues to the south-west of Buenos Ayres. Th gatherium was a tardigrade (slow-moving) anima the sloth, and was at least the size of a comm Its limbs were terminated by five thick toes, att to a series of huge, flat, metatarsal bones, or those with which the toes are continuous, as in the h foot. "Some of the toes (says Buckland, in his of this creature) are terminated by large and po claws of great length; the bones supporting these are composed partly of an axis, or pointed core, filled the internal cavity of the horny claw; and of a bony sheath, that formed a strong case to r and support its base." These claws, from their po were admirably calculated for the purpose of di The legs of this creature were of enormous thic its thigh bone being nearly three times the thickn the same bone in the elephant. The other bones Megatherium were almost proportionably heav still more remarkable feature, however, in the an structure, was the coat of armour, of solid bone, v from three-fourths of an inch to an inch and a h thickness, which covered its hide, in the same m as the armadillo's is encased by the same substan

The habits and peculiarities of this stupendous for so the Megatherium may be termed, are w scribed and explained in Dr Buckland's Bridge Treatise. After stating that with the head and sho of a sloth, it combined, in its legs and feet, an admi of the characters of the ant-eater and the arm and resembled them still more in being cased in of armour, he continues, "Its haunches were mor five feet wide, and its body twelve feet long and feet high; its feet were a *yard in length*, and termi by most gigantic claws; its tail was probably c armour, and much larger than the tail of any beast among living or extinct terrestrial mam Thus heavily constructed, and ponderously acco it could neither run, nor leap, nor climb, nor b under the ground, and in all its movements must been necessarily slow; but what need of rapid lo tion to an animal, whose occupation of digging ro food was almost stationary! and what need of spe flight from foes, to a creature whose giant carcas encased in an impenetrable cuirass, and who by a pat of his paw, or lash of his tail, could in an i have demolished the cougar or the crocodile! S within the panoply of his bony armour, where w enemy that would dare encounter this behemoth Pampas (the South American region where it exi or in what more powerful creature can we fin cause that has effected the extirpation of his race

His entire frame was an apparatus of co mechanism, adapted exactly to the work it had t strong and ponderous, in proportion as this wor heavy, and calculated to be the vehicle of life an joyment to a gigantic race of quadrupeds; w though they have ceased to be counted amon living inhabitants of our planet, have, in their bones, left behind them imperishable monuments consummate skill with which they were construc

Another extinct tardigrade creature, presenting of the characters of the Megatherium, was disco in a calcareous cavern in Virginia, and received President Jefferson, who first described some bones, the name of the *Megalonyx*. Jefferson conc the claw to be that of an extinct feline animal of size (that is to say, an animal of the same deser as the tiger, lion, cat, and lynx, all of which are l of prey); but the French naturalist declare possessor of the claw to have been herbivorou calculated to live on herbs; and this was triumph proved by the discovery of others of its bones. Megalonyx appears (for a complete skeleton ha yet been found) to have been a little smaller th than the Megatherium. But the Megalonyx, acco to Cuvier, was herbivorous after the manner o

sloth, since its teeth were conformed precisely like that animal's. From the resemblance of their feet, also, he concludes that their gait was similar, and all their movements alike. The difference in volume of body, however, must have prevented the habits of the Megalonyx from being perfectly analogous to those of the sloth. The Megalonyx could but seldom have climbed up trees, because it must rarely have found any sufficiently strong to support its weight. But its height would enable it to browse, like the sloth, among the leaves of trees, without its being under the necessity of climbing any but such tall and strong ones as could bear its weight. It is even possible that the weight of the creature may have been serviceable in bending down, and perhaps in breaking, the elevated branches which contained its food.

The next fossil animal to which we shall refer, is that long called the *Mammoth*, under the impression that it was a distinct genus, but which is now universally denominated the *Fossil Elephant*, as being an extinct species of that existing family. The Mammoth (which name we shall retain for the sake of distinction) is rather to be regarded as a creature of the Diluvial than of the Pliocene period (that is to say, belonging to the age, when, by means of floods, the present beds of gravel and hard clay so often found between the rocks and vegetable soil were laid down upon the earth), as some specimens have been discovered in Siberia, with portions of the flesh and hair actually preserved along with the bones among the ice. It was at first thought, when numbers of Mammoth bones were discovered in Italy, and other southern countries of Europe, that they were the remains of elephants brought by the Romans and others from Asia and Africa; but the incalculable quantities of them ultimately detected in Russia and other districts, where elephants were never brought in the shape of oriental tribute as they were to Rome, showed that their presence was to be attributed to natural causes, and not to the casual agency of man. In truth, the beds of the Volga, Don, and other northern rivers, are filled with them, and this can be accounted for only on the hypothesis, either of an alteration in the habits of the elephant, or of a great change of climate in these parts, or of some immense moving force on the face of the earth, which has carried them thither. The instance in which part of the flesh was found along with the bones, will supply us with a general description of the Mammoth. When the animal, on this occasion, was first seen through the mass of ice in which it lay, the soft parts were nearly entire. After the natives had fed their dogs for a long time with the mountainous hulk of flesh, Mr Adams of St Petersburgh heard of it, and set out to see it. When he reached the spot, the skeleton was entire, with the exception of a fore leg. The spine of the back, a shoulder-blade, the pelvis, and the rest of the extremities, were still united by ligaments and a portion of the skin. The other shoulder-blade was found at some distance. The head was covered with a dry skin. One of the ears, in high preservation, was furnished with a tuft of hair, and the pupil of the eye was still discernible. The brain was found in the skull, but in a dry state. The neck was furnished with *a long mane*, and the skin, generally, was covered with black hairs and a reddish sort of wool. Of the quantity of hair and bristles that had been on the body, some idea may be formed from the fact that thirty pounds of them were gathered from the ground, where the dogs, in eating the flesh, had dropt them. The tusks were more than nine feet long, and the head, without the tusks, weighed more than four hundred pounds. Altogether, the skeleton of this Mammoth was about the size of a large elephant's.

Skeletons similar to this have been found in abundance in the islands of the Arctic sea. They differ in several minute points of structure from the common elephant, and on this circumstance the most rational explanation of their being found in such cold climates is founded. This explanation is, that the Mammoth Elephant was of a species fitted to be a native of cold countries; and of this reasoning, the different structure, and the long thick hair, are held to be proofs. Whether this may be the case or not, it seems certain that the Mammoth's existence must have been very recent, and must have approached closely to, if not encroached on, the era of man.

SUPERFICIAL.

Diluvium, Alluvium, Peat, and Vegetable Soil.

In many parts of the earth's surface, a thick bed of compact clay, containing stones of various sizes, and sometimes of a red, sometimes of a blue colour, is found above the hard rocks: it is called *Diluvium*, as supposed to have been deposited by a deluge which had swept over the earth after the most of the present rocks had been formed, and placed in their present arrangement. Some of the stones contained in the diluvium are rounded as by the act of rolling; others contain seams or grooves, which are supposed to have been occasioned either by their rubbing on some hard substance in passing, or having been rubbed against by smaller stones passing them. All over the earth large blocks of stone are found on or near the surface, which it is certain have been carried from great distances, as rocks of the same kind in their original position are not to be found near. There are blocks of this kind in Cumberland, which appear to have originally belonged to hills in the south of Scotland; and some have been found in the district between the Trent and Thames, which geologists suppose to have been brought thither from Norway.

The *Alluvium* is the matter carried down by rivers, and deposited in large level spaces beside their banks, or in islands at their mouths.

Peat is an accumulation of decayed vegetable matter mixed with water. It is well known for its properties as fuel.

The *Vegetable Soil* is generally composed of the inferior substances in a pulverised state, or of detritus carried from a distance, mingled with decayed vegetable and animal matters.

Remains in the Diluvium, &c.

The period when the diluvium was deposited, being that immediately preceding the existing order of things on the earth's surface, is marked by the remains of animals, many of which still exist, while others are extinct. The chief evidence on this point is derived from bones, and fragments of bones, found in caves which are supposed to have served about the time of the diluvial action, as retreats for Hyænas and other beasts of prey. That of Kirkdale, in Yorkshire, discovered a few years ago, was found to contain remains of twenty-three species; namely, Hyæna, Tiger, Bear, Wolf, Fox, Weasel, Elephant, Rhinoceros, Hippopotamus, Horse, Ox, three species of Deer, Hare, Rabbit, Water-rat, Mouse, Pigeon, Raven, Lark, a species of Duck and Partridge. The bones, in all these cases, were broken into angular fragments or chips, and were all more or less decayed, though the gelatinous matter yet remained in some of them. They were covered by a layer of mud about a foot deep, the nature of which led to the supposition that it must have been deposited during the action of the diluvium.

Till a recent period, no trace of any animal of a higher order was discovered in rocks. Some remains of a human skeleton had been found in a cave in Guadaloupe, imbedded in stony matter; but it was concluded, in that case, that the enclosing matter was of recent formation, and that the human being whose relics were discovered in it, might have been alive at no distant era. Latterly, however, fossil zoology has made one step in advance. In 1838, a fossil jaw-bone of one of the *quadrumana* (four-handed or monkey tribes) was discovered in the tertiary formation at the northern foot of the Pyrenees, in the department of Gers, in France. Two deposits there are very rich in fossils, affording remains of no fewer than thirty mammiferous animals. In the second and newer of these, which is lacustrine, or a deposit from a fresh-water lake, the jaw-bone of the monkey was found, containing four incisor teeth, two canine, four false grinders, and

six true grinders in a continued series. The monkey is supposed to have been about three feet in height. The bone occurred in a stratum of marl, covered by compact limestone. Another jaw-bone of a monkey was discovered with other remains, in August 1839, in a brick-field at Kingston, near Woodbridge, in the county of Suffolk: the particular bed in which it was found has not been stated. The bone indicates a species of the quadrumana not now existing.

These must be considered as very interesting discoveries. The earliest animals and plants are of the simplest kind. Gradually, as we advance through the higher strata, or, in other words, as we proceed through this record of progressive creation, we find animals and plants of higher and higher structure, till at last we come to the superficial strata, where there are remains of kinds approximating to the highest of all the animated tribes, namely, man himself. But, before the above discoveries, there remained one remarkable gap in the series. The quadrumana, or monkeys, who form an order above common mammalia, but below the bimana, or human tribes, were wanting. Now this deficiency is supplied; and it is shown that every one of the present forms of animated existence, *excepting the human*, existed at the time when the superficial strata were formed. The only zoological event of an important nature subsequent to that period is the creation of man; for we may consider of a lesser importance the extinction of many of the specific varieties which flourished in the geological ages, and the creation of new.

VOLCANIC.

Rock of this kind owes its origin to internal fire, which seems to have sent it up in a state of fusion. It is spread over large parts of the surface of the earth, particularly in France, where there are many extinct volcanoes. The apertures through which it has forced its way from below, and the chinks and rents formed at the time of its eruption in adjacent rocks, are often found filled with it. Large mountains are also composed of volcanic rock. It is remarkable for the fine soil formed out of it.

The chief varieties of volcanic rock are—

Trap, a term from the Swedish, expressive of the appearance of stairs which a hill of this rock often presents—a bare precipice alternating with a grassy platform or terrace. In trap rocks, nodules are often found; that is, little isolated masses of a different consistence from the including matter: the rock is then said to be of *amygdaloidal structure*, from a Greek word signifying raisins. This peculiarity is owing to the porousness of the original matter: it contained many small air-cells, which, being afterwards filled up with silex, carbonate of lime, zeolite, and other ingredients, became nodules of those substances.* In plutonic rocks, no such peculiarity is ever found.

Basalt, a dark grey rock, of crystallised form, masses of which resemble groups of pillars, the various pillars generally having regular sides and angles, and the whole joined compactly together. The Giants' Causeway, in Ireland, and the Island of Staffa, in the Hebrides, are notable examples of basalt. The structure of basalt is found to have originated in the manner in which refrigeration, or cooling, took place at its formation. The process has been imitated on a small scale by the fusing of a few hundred-weights of basalt, and allowing the mass to cool in the furnace: as the cooling gradually proceeded, globules appeared; these enlarged till they pressed laterally [sideways] against each other, and became converted into polygonal [many-cornered] prisms. Thus the rock was replaced in something like its original form, in a common furnace.

Greenstone, a compact, hard, tenacious rock, of dark greyish colour, slightly tinged with green.

Lava (a term from the Gothic, signifying *to run*), the *product of modern volcanic mountains.*

* *Lyell's Geology, iv. 174.*

SECTION IV.—MINERAL VEINS.

Throughout the primary, transition, secondary, and tertiary rocks, but particularly the two first kinds, there occur what are called *veins*, containing diverse substances, most commonly metals, quartz, and calcareous spar, the last being a hard and shining substance deposited from lime. The form and direction of veins may be best understood from the way in which they mostly seem to have originated, namely, by chinks or cracks formed in all directions throughout the rocks, and which have subsequently been filled with various substances.

Those filled with metals penetrate downwards so far that their lower ends are rarely found, and miners have an idea that they reach quite through the earth. Near the surface of the earth, they are generally found poorest in the metal they contain, richer at a certain distance down, and then poor again. They also often change their metal at different depths. In France there are veins which contain iron above, then silver, and next copper. One of the Cornwall mines has zinc above, and copper in great quantity below. These veins also change their width at different depths: thus, the Dalcoath mine in Cornwall varies from forty feet to six inches in width.* What at first appears extremely strange, a vein will sometimes be rich, or contain abundance of the metal, at the place where it passes through one kind of rock, and poor where it passes through another. Thus, for instance, a copper vein will be productive as long as it is dug through slate, and become poor when it passes into granite. Such a vein, it may also be remarked, is generally found richest in the slate when it approaches the granite.

Till a recent time, two theories as to the formation of metallic veins were predominant—one representing them as the result of a forcing of fused matter from below into the chinks, the other accounting for them by supposing an infiltration of the matter in water from above. These theories, respectively termed Huttonian and Wernerian, are now given up: "many veins are fissures of mechanical origin, into which metalliferous matter has been sublimed from the effects of high temperature; but others have resulted from an electro-chemical 'separation or segregation of certain mineral and metallic particles from the mass of enveloping rock, while it was in a soft or fluid state, and their determination to particular centres.'"† Within the last few years, much light has been thrown on the subject by electro-chemical experiments, whereby the workings of nature, in this department of her economy, were imitated on a small scale. Becquerell and Mitcherlich, foreign mineralogists, have succeeded in forming crystals by electricity. Our own countryman, Mr Andrew Crosse of Somersetshire, has in like manner formed calcareous spar out of water which had percolated through a limestone rock, and which was forming crystals naturally at the place where the experimentalist obtained it. The same gentleman produced quartz crystals, and thus made the formation of what are called precious stones no longer a mystery. The electric apparatus used by Mr Crosse was of small power, but kept long in operation, such being the way in which nature works the same ends.

In Mr Crosse's experiments, the same solution produced different substances at different ends of the electric pole. For example, a battery operating for six months on fluat of silver, produced at the negative pole six-sided cubes of silver, and at the positive crystals of silica and chalcedony. This opens up a most interesting field of speculation. The difference of substances found in certain veins, their comparative richness and poorness, may have been the consequence of different electric states in the rocks in which they were deposited.

GEOGRAPHY.

INTRODUCTORY.

The Earth which we inhabit, as has been explained in the article Astronomy, is a nearly round globe or mass of matter, forming one of eleven primary planets, which at various distances revolve round the sun as a centre, and receive from that splendid luminary the blessings of light and heat. The earth is one of the smaller sized of the planets, being only about a fourth of the diameter of Uranus, and an eleventh of the diameter of Jupiter, and forms, therefore, a comparatively small portion of the planetary system, and, with reference to the stars, only a speck in the vast extent of creation.

According to the calculations of astronomers, the earth is 7902 miles in mean diameter, and measures about 25,000 miles in circumference. But the diameter or thickness is greater at the middle, or equinoctial line, than in the contrary direction. The cause of this has been explained in Astronomy, but may here be briefly adverted to. The diurnal motion of the earth on its axis, or imaginary poles, causes a greater whirl at the middle than the extremities of the mass, and the earth, originally in a soft state, has been there bulged out all round. The extent of this bulging is twenty-six miles on the whole thickness, or thirteen miles from the surface to the centre of the earth. Thus, *the form of the globe is that of an oblate, or flattened sphere, and its diameter is twenty-six miles greater from one side to another, at the equinoctial line, than betwixt the poles.* Such is the nice adjustment of the daily motion of the earth on its axis, that if it were only a little greater, the sea would rise and fly off, and if the velocity were still more increased, the whole mass of earth and water would be dispersed in fragments, or, in other words, be destroyed. The earth, as far as can be ascertained, is a solid body, well balanced in all its parts, and consists of two kinds of matter, land and water—the land being composed of rocks, metallic ores, soils, and a variety of other substances (see Geology); while the water, as is well known, is of two qualities, fresh and salt—the former in lakes and rivers, and the latter in the sea or ocean. The greater part of the earth consists of solid land or rocky matter, but a large proportion of it is covered by the waters of the ocean; and therefore, to appearance, the ocean forms the principal portion of the globe. It is so, however, only in appearance, notwithstanding its imposing extent, the water being merely a superficial covering to the land.

The manner in which the land is mixed with the ocean is quite irregular, and the relative situation and dimensions of each are constantly shifting. From causes which have been explained in the article Geology, the sea is daily making encroachments on the land, while the land at other places is in the course of being left dry by the sea. Thus, in point of fact, the external features of the globe are ever changing; and it may

be safely averred, that in the course of ages there has been a thorough alteration over the whole surface of the globe—that not one part now resembles that form which it originally possessed.

In order to facilitate the operations of the navigator and traveller, and with the view to mark the relative situation of every spot on the earth's surface, the globe has been subjected to divers measurements, by means of ideal lines drawn from north to south, and east to west, as represented in the figure which forms the frontispiece. In the first place, the whole surface is represented as spread out in the form of two hemispheres—the Eastern Hemisphere containing the continents of Europe, Asia, and Africa, and the Western Hemisphere North and South America. The line which appears to cut across the hemispheres at the middle is the *equator* or equinoctial line, and from this are measurements in degrees of latitude.

The earth's surface has been calculated to contain 198,943,750 square miles, of which scarcely a third part is dry land; the remaining two-thirds are water. The land is composed principally of two large masses or tracts, one of which comprehends the continents of Europe, Asia, and Africa; the other comprehends the continent of America. Australia, which lies in the ocean in a southerly direction from Asia, is so extensive as to be entitled to the name and character of a fifth division. All the detached and smaller masses of land, called islands, when taken together, are computed to contain as much land as the continent of Europe. In reference to maps of the earth, Europe, Asia, Africa, and Australia, with their islands, are distinguished as lying in the eastern hemisphere; while America, with the West Indian and other islands, are comprehended in the western hemisphere. The seas which encompass these extensive tracts of land have locally various names; but the two principal expanses of water are the Atlantic and Pacific Oceans—the former separating Europe, Asia, and Africa, from America, on the west, and the latter lying betwixt the western shores of America and the eastern shores of Asia. The extensive oceans surrounding the north and south poles are called the Polar Seas, which have not been explored sufficiently for us to be able to say whether any large tracts of land lie in these remote quarters of the globe. Great diversity of opinion prevails with respect to the depth of the ocean. By numerous investigations, it does not appear that the depth is any where much more than two or three miles, generally it is a great deal less; and it might be argued, that notwithstanding the large surface of the ocean, the body of its waters can only be considered as lying like lakes in the hollows of the land; for the earth, as already noticed, is eight thousand miles in diameter, and to that huge mass of dense matter the sea bears no proportion in its depth. While the surface of the land exhibits a variety of mountain ranges, hills, vales, and plains, so also is the bottom of the sea varied in its configuration, abounding in sandbanks, hills, rocks, and reefs dangerous to the mariner; and the islands which rear their heads above the surface are only the tops of the highest hills and mountains in the sea.

The waters of the ocean, as every one knows, are salt to a greater or lesser degree—a quality which is considered necessary to preserve them from putridity. How they should possess this saline property, no one has yet been able to explain satisfactorily. Some have imagined that the saltness is caused by rocks of salt at the bottom of the sea, but this is obviously incorrect, for rocks of salt do not abound to such an extent as would be required for performing this important office. It is more probable that the saltness is an inherent property in the water itself; there is at any rate nothing more strange in this than in the circumstance of the atmosphere being in its nature composed of divers kinds of air or gases.

' an examination of this point, however, and for a
ir account of the ocean and its tides, we refer to
icle THE OCEAN.

ording to the beautiful harmony of design mani-
in all departments of creation, the earth, with its ocean, its atmosphere, its rivers, and its var climates, forms an appropriate field for animal vegetable existence. The manner in which ani and plants are thus distributed in situations and cumstances exactly suited to their character, is a ter of deeply interesting observation. Nature- which, as a phrase of convenience, we denote the Creating and Disposing Power—has appointed very forms of animal or vegetable life to be localised in portion of the globe approaching to its entire terres surface. Most of them are calculated for certain grees of heat and cold, dryness and moisture; and cordingly, are to be found distributed in rings or z around the globe, or at certain elevations, with a d reference, in all cases, to the temperature and c conditions of the situation.

It appears, from the researches of geologists, the distribution of animal and vegetable forms ha the course of ages, undergone variations conform to alterations of condition in soil, climate, and c circumstances. Races of animals have thus ent disappeared from the surface of the earth, while in tracts of land, which have risen from the bosom o deep, have become clothed with vegetation, and are the appropriate theatre of existence of various kin animals. The dispersing power of winds and curr not to speak of the active interference of man, is posed to be capable of accounting for the distrib of many plants; but it is clear, that without the vigilant superintendence of an all-wise Providence earth, taken in its whole extent, could not exhibit remarkable forms of animal and vegetable life are so nicely suited to the localities in which the placed. In Europe, and nearly all other temp regions, we find the horse, the cow, the dog, the the crow, the sparrow, the house-fly, and other tures with which we are familiar, because the n of these animals is suited to climates of mod heat and cold. In the warm and dry regions of and Africa, other forms of animal life prevail—a lion, tiger, and camel; the latter being suited to verse wide sandy deserts, and to endure privatio drought for a greater length of time than other b of burden. America has the condor, the Washi eagle, the llama, and other great birds and beas prey peculiar to itself. A remarkable distinctio animal forms is that found in Australia. Ther will be afterwards mentioned, the quadruped race furnished with pouches for their young, and move ward by leaping, peculiarities conformable to the lity in which they happen to be placed.

EUROPE.

Europe is the smallest of the great divisions of globe, but distinguished above the rest by the char of its population, the superior cultivation of the and the flourishing condition of arts, sciences, indu and commerce, the multitude of large and well- cities, and its power and influence over the other of the world.

It is washed on three sides by the sea, which is by different names, and belongs either to the Nor Arctic or the Atlantic Ocean. A narrow strait Mediterranean separates it from Africa. On the alone it joins the mainland, being there separated Asia by an imaginary line. Europe is situated i northern frozen and the northern temperate between 10° and 63° east longitude, and 36° an north latitude. Including the islands, which co about 317,000 square miles, the whole extent of E amounts to about 3,250,000 square miles, of Russia comprises nearly one-half. The greatest le from Cape St Vincent, in Portugal, to the norther tremity of the eastern boundary, at Waygatt's, is 3,500 miles. The greatest breadth, from Cape Ma in the Morea, to the North Cape in Norway, is 2500 miles.

Europe is remarkably well watered, althoug rivers have not so long a course nor such large

racts as those in other parts of the globe, particularly in America. The principal rivers are the Ebro, the Rhone, and the Po, running into the Mediterranean; the Danube, the Dnieper, and the Dniester, into the Black Sea; the Don, into the Sea of Azoph; the Wolga, into the Caspian; the Dwina, into the Arctic Ocean; another Dwina or Duna, the Vistula, and the Oder, into the Baltic; the Elbe, Weser, and Rhine, into the North Sea; the Seine into the English Channel; the Thames into the German Ocean; the Loire and Garonne, the Duoro and Tagus, the Gaudiani and Gaudalquiver, into the Atlantic. The Wolga and Danube are the longest. By the Danube, which penetrates the continent on its southern, and the Rhine which penetrates it on its north-western side, Europe is almost cut in two by water-courses. The Rhine is celebrated for the romantic beauty of its banks, on the middle and higher part of its course. At the distance of 200 miles from the sea, it is as broad as the Thames at Westminster, and suitable for navigation with steamboats and small vessels.

Europe possesses numerous large lakes, but none so extensive as those in North America. The largest is Lake Ladoga in Russia. The lakes celebrated for their beauty and extent are Lake Constance and Lake Leman in Switzerland, or on the borders of that country.

A great part of Europe is mountainous; the southern more so than the northern. The most elevated region is Switzerland, from which there is a descent, which terminates, on the side of the North Sea and the Baltic, in low plains. The lowest and most level parts are Holland and Northern Germany, Denmark, Russia, and Prussia. The highest mountains are the Alps, in Switzerland and Italy, which spread from those countries in various directions, extend westwardly into France, and are connected by the Cevennes with the Pyrenees, which separate France from Spain. One chain of the Alps stretches south towards the Mediterranean; then, taking an easterly course, runs through Italy, under the name of the Appenines. Several branches run eastward from the Alps, through the south of Germany, as far as the Turkish provinces. Another chain, the Jura, runs to the north, and separates Switzerland from France. In the east of Europe are the Carpathian mountains, which on one side meet the Sudetic range, and on the other the mountains of Turkey in Europe. The highest mountain in Europe is Mont Blanc, in Savoy, one of the Alps, which is said to be 15,766 feet above the level of the sea.

Several of the European mountains are volcanoes; as Ætna, Vesuvius, and Hecla. It is a fact worthy of notice, that none of the volcanoes of Europe are to be found in any of the great chains of mountains which have just been enumerated. The only one on the continent is Vesuvius, and this is too much detached to be considered as properly forming one of the Appenines. Ætna, in the Island of Sicily, rising to the height of ten or eleven thousand feet above the level of the sea, is the largest European volcano. The Lipari Islands, anciently called the *Æolian*, a few miles to the north of Sicily, bear evident marks of a volcanic origin; and in several of them, subterranean fires are still in operation. Iceland, too, presents the most abundant tokens of the presence of volcanic fire, and has often suffered under its devastations; Mount Hecla is the most noted, although not the only source of the eruptions on this island. To the possession of many inland seas, and, consequently, of a line of coast very extensive in proportion to its area, Europe is greatly indebted for the great advancement of its inhabitants in civilisation; these circumstances being favourable to that intercourse without which nations never make great advances.

The chief islands belonging to Europe are—Iceland, in the north sea, lying in the 65th degree of north latitude; Great Britain, Ireland, and other British islands, in the Atlantic and German Oceans; Majorca, Minorca, Sardinia, Sicily, Corsica, Elba, the Ionian Isles, Malta, Candia, and Cyprus, in the Mediterranean Sea. The European peninsulas are six in number: Scandinavia, Jutland, Crimea, Italy, Spain, and Greece. The soil of Europe, though not equal in luxuriance to that of the tropics, is almost throughout fit for cultivation. The tracts in the northern zone are almost the only exception.

With respect to climate, Europe may be divided into three parts—the warm region, where the lemon-trees grow wild, as far as 48° north lat., having a pleasant spring, a hot summer, and short winter; the temperate, as far as 65° N., in which grain ripens; and the cold region, to the extreme north, where nothing will grow but reindeer moss, and no domestic animal can live except the reindeer. The products are not so various as in other parts of the world, and many of them were originally brought from foreign countries and naturalised; but, on the other hand, Europe can boast of a more perfect cultivation. Among the animals are horses, some of which are of the nobler breeds; horned cattle; sheep in Spain, Saxony, and England, of the finest wool; asses, goats, swine, dogs; reindeer; wild beasts of different kinds, valuable for their flesh or fur; whales, sea-cows, sea-dogs; abundance of wild and tame fowl; large quantities of fish in the seas, lakes, and rivers, among which the herring, in particular, affords sustenance to many of the inhabitants; useful insects, such as bees, silkworms, kermes, gall-flies, and Spanish flies. Oysters and pearl mussels also abound. It produces all kinds of grain, and sufficient for its consumption; beautiful garden plants; abundance of fruits, including those of southern climates, such as figs, almonds, chestnuts, lemons, oranges, olives, pomegranates, dates; also flax, hemp, cotton, madder, tobacco; the best kinds of wine; and a great variety of wood for fuel, and for house and ship building. The birch and the willow best endure the cold of the northern polar circle. Europe produces all the varieties of metals and minerals in great excellence and abundance. In gold and silver, Hungary and Transylvania are the richest; in iron, the northern countries, Sweden, Norway, and Russia. Salt of all kinds, rock, sea, and spring salt, is also abundant in Europe.

The inhabitants, estimated by Malte-Brun at 200 millions at least, are unequally distributed; in Russia and Sweden there are from fifteen to eighteen to a square mile; in the Netherlands, where the population is most dense, Italy, France, Great Britain, and Germany, the same extent supports from one hundred and fifty to two hundred and fifty persons. The inhabitants consist of several different races, speaking distinct languages. The stocks to which the principal languages belong, are—the Teutonic, which is the mother of the German, Dutch, English, Swedish, and Danish; the Latin, or Roman, now spoken only by the learned, but the mother of the Italian, French, Spanish, Portuguese, and Wallachian; the Sclavonic, to which belong the Russian, Polish, Bohemian, Bulgarian, Vandal, and the Servian, or Illyrian. Besides these, there are the modern Greek; the Turco-Tartaric; the Finnish and Hungarian; the Celtic in Wales and the north-west part of France (Bretagne); the Highlands of Scotland and Ireland; the Basque, among the Pyrenees. The most widely spoken is the German, with its kindred languages, formed by an union of the Roman with the Teutonic.

The prevailing religion is the Christian, which includes several churches, viz., the Roman Catholic, which is the most numerous; the Protestant (Lutheran, Calvinistic, and Anglican), consisting of numerous sects—Anabaptists, Mennonites, Quakers, Unitarians, Methodists, Moravians, and the Greek church. A part of the inhabitants profess the Jewish, a part the Mahommedan religion. Among the Laplanders and Samoeides, there are also some heathens, but their number is small.

Agriculture has made great advances in Europe, and is daily improving. In this respect, those countries are particularly distinguished where the Teutonic languages are spoken, as also are France and a part of Italy. In no part of the world are manufactures carried to such perfection as in several of the

European countries, especially in Great Britain, France, the Netherlands, and Germany. The inhabitants work up not only native European, but also foreign products, and supply all the wants and luxuries of life. Commerce is not less active, and is promoted by well-constructed roads and canals, by well-organised posts, banks, insurance companies, commercial companies, and fairs. The commerce of Europe extends to all quarters of the world, and every sea is filled with European ships. In this respect, Great Britain is most distinguished. Europe is the seat of art and science; to her belongs the honour of discovering the most important truths, of giving birth to the most useful inventions and the finest productions of genius, and the improvement of all the sciences. In intellectual progress, the Teutonic races, and those who speak the languages derived from the Latin, have surpassed the Slavonic nations. The Turks have remained strangers, in many respects, to the literary and scientific improvement which has marked the other European nations. Eighty-five universities provide for the higher branches of education; numerous gymnasia and academies for the preparatory studies, and a great number of lower schools, particularly in Germany, are employed in educating the common people. In many places there are academies of science, and societies of all kinds, for the cultivation of the arts and sciences.

By its physical situation, Europe is divided into East and West Europe. West Europe comprises the Pyrenean peninsula (Spain and Portugal), the country west of the Alps (France), the countries north of the Alps (Switzerland, Germany, and the Netherlands), the country south of the Alps (Italy), the islands of the North Sea (Great Britain, Ireland, and Iceland), and the countries on the Baltic (Denmark, Norway, Sweden, and Prussia). East Europe contains the countries north of the Carpathian mountains (Russia and Gallicia), and the countries south of the Carpathian mountains (Hungary, in its more comprehensive sense, and Turkey).

The following are the political states of Europe:—The three empires of Austria, Russia, and Turkey; seventeen kingdoms, viz., Portugal, Spain, France, Great Britain, Holland, Belgium, Denmark, Sweden, (including Norway), Sardinia, the Two Sicilies, Greece, Prussia, Bavaria, Saxony, Hanover, and Würtemberg; one ecclesiastical state, the papal dominions; eight republics, namely, Switzerland, the Ionian Islands, San Marino, Hamburg, Lubeck, Bremen, Cracow, and Frankfort; one electorate, Hesse; six grand-duchies, Baden, Hesse-Darmstadt, Saxe-Weimar, Mecklenburg-Schwerin, Mecklenburg-Strelitz, and Tuscany; twelve duchies, viz., Oldenburg, Gotha, Meiningen, Altenburg, Brunswick, Nassau, Dessau, Bernburg, Cöthen, Modena, Parma, and Lucca; one landgraviate, viz., Hesse-Homburg; twelve principalities, viz., Hohenzollern-Hechingen, Hohenzollern-Sigmaringen, Schwarzburg-Rudolstadt, Schwarzburg-Sondershausen, Waldeck, Lippe-Detmold, Schaumburg-Lippe, Lichtenstein, Reuss-Greiz, Reuss-Schleiz, Reuss-Lobenstein, and Reuss-Ebersdorf.

Austria, Prussia, Bavaria, Saxony, Hanover, Würtemberg, Hamburg, Lubeck, Bremen, Frankfort, Hesse, and the above grand-duchies and duchies, compose the region which we call Germany, but the proper name of which, as given by the natives, is Deutschland—the land of the Teutones, an ancient people of central Europe.

THE BRITISH ISLANDS.

These islands, the most important belonging to Europe, lie at a short distance from the north-west coast of France, betwixt the Atlantic Ocean on the west and the German Ocean on the east. From their southernmost boundary upon the British Channel to the most northerly of the Shetland group, is a distance of very nearly eleven degrees, measuring from the 50th to the 61st degree of north latitude. The main island, which since the Union has been called Great Britain, is composed of two portions, with considerably distinctive features, under the names of England and Scotland. England forms the larger, the most southerly, and much the finest portion of the island, and lies betwixt the 50th and 55th degree. Scotland lies on the north of this division, and reaches the 58th degree. Ireland is a large and beautiful island lying to the west of England, from which it is separated only by a channel half a day's sail in breadth, and extends in length from 51° 10′ to 55° 20′ north latitude. Its greatest length, measuring from N E. to S W., is about 300 miles; the greatest breadth about 60 miles. The chief of the minor islands are the Isle of Man, lying in the Irish Channel; Anglesea, on the coast of Wales; the Hebrides, a series of large and small isles on the west coast of Scotland; the Orkney Islands, separated from the north point of Scotland by the Pentland Firth; and the Shetland Islands, lying considerably north of the Orkneys. Besides these, there are some islands in the British Channel, near the coast of France, called Guernsey, Jersey, Alderney, &c. Reckoning large and small, the British islands amount to some hundreds in number, but many of the smallest are not inhabited.

In 1831, the population of England and Wales was 13,894,569, of Scotland 2,365,807, and of Ireland 7,734,365; adding the number of individuals in the army and navy, 277,017, the total population amounted to 24,271,758. Reckoning the inhabitants of foreign countries subject to Great Britain, the entire population of the British empire amounts to about 118,000,000.

[It is considered unnecessary here to say any thing further of the British Islands, as they form the subject of various other articles, entitled HISTORY OF GREAT BRITAIN, DESCRIPTION OF ENGLAND, DESCRIPTION OF SCOTLAND, DESCRIPTION OF IRELAND, CONSTITUTION AND RESOURCES OF THE BRITISH EMPIRE, not to speak of the accounts of Canada, West Indies, East Indies, and other foreign possessions, each forming distinct numbers of the present work.]

FRANCE.

After Great Britain, France is usually reckoned the most powerful and influential country in Europe. In point of territorial extent and amount of population, it stands much higher than Great Britain, which is but a small country, and it likewise possesses a finer climate; nevertheless, such have been its unfortunate political and religious dissensions and misarrangements, that it has permitted itself to be outstripped in the race of improvement by England. Yet under all its backwardness, in many points France forms a great nation, well deserving of the sympathy and respect of its neighbours; and it is greatly to be desired that in future a good understanding should subsist betwixt it and Great Britain.

France is situated between latitude 42° 20′ and 51° 5′ N., and longitude 3° 51′ E. and 9° 27′ W., comprising an extent of 213,800 square miles, with a population according to official returns, in 1827, of 31,851,545. It is bordered on the north-east by the Low Countries, the Prussian province of the Lower Rhine, and Rhenish Bavaria; on the east, it is separated from Baden by the Rhine, and touches Switzerland and Sardinia; on the south, its boundaries are the Mediterranean, the Pyrenees, and the Bidassoa; the ocean bounds the rest. The island of Corsica, and the Hières, in the Mediterranean, and the Isles of Oleron, Ré Noirmoutier, Belle-Isle, Dieu, and Ushant in the Atlantic, belong to France. The foreign possessions are of little value. They are, in Asia, Pondicherry and Karical on the Coromandel coast, Yanaon in the Northern Circars, Chandernagore in Bengal, Mahe on the Malabar coast, a factory at Surat, and some factories in Arabia, containing in all 179,000 inhabitants; in Africa, Senegal, Goree, the Isle of Bourbon, and some factories, containing 99,000 inhabitants; in America, Martinique, and Gaudaloupe with its dependencies, Guiana, and the small islands of St Pierre and Miquelon, near Newfoundland, containing 225,000 inhabitants. The territory is divided into 86 departments, which generally derive their names from the rivers. They are subdivided into 363 arrondissements, 2844 cantons,

and 38,339 communes. Each department is governed by a prefect, and each arrondissement by a subprefect. The cantons have no administrative powers. The communes are under a mayor. The provincial officers generally are appointed by the home minister, only those of towns under 5000 inhabitants being appointed by the prefect.

The principal mountains of France are—1. The Vosges on the north-east. They are of a rounded outline, with gentle slopes, and afford much open pasturage. The highest summit is not more than 4500 feet high. 2. The Jura mountains lie to the south of these, and their summits rise to the height of 6000 feet. 3. Many Alpine branches intersect Dauphiny and Provence. In the centre of the kingdom are—4. The mountains of Auvergne, of volcanic origin, of which the Puy de Dome, the Monts d'Or, and the Cantal, are the most conspicuous. 5. The Cevennes lie to the south-east of the range last mentioned. Their highest summit is Mont Lozère (about 6510 feet). 6. The Pyrenees form the principal part of the boundary between France and Spain. These mountains divide the country into four great basins, the form and exposure of which necessarily have a great influence on their climate and productions. The narrow valley of the Rhone runs from north to south, while the open basins of the Seine, the Loire, and the Garonne, stretch in a north-western direction. The Adour rises in the Pyrenees, and washes the walls of Bayonne. The other rivers are principally tributaries. The Marne and the Oise fall into the Seine; the Allier, the Loire, the Sarthe, and the Mayenne, into the Loire; the Rhone receives the Saône, the Isére, the Durance, the Ain, and the Sorgue; the Tarn and the Dordogne join the Garonne. The numerous branches of these rivers are joined by canals, which form an extensive internal water communication.

In respect to soil, the richest part of France is the northern division, comprehending the provinces of Flanders, Artois, Picardy, Normandy, and the Isle of France, where there is a deep rich loam; about 16,179,590 acres in extent. The valley of the Garonne is composed of a friable sandy loam, with a calcareous mixture, and moisture sufficient for every purpose. This district contains 7,654,561 acres. The great valley of Languedoc is extremely prolific, though the soil is not so fine as that of the preceding districts. The Limagne, a valley of Auvergne, is considered to have one of the finest soils in the world. It consists of beds of earth, said to be twenty feet deep, formed from the decomposition of soft basalt. The calcareous and chalk formations are extensive. The chalk provinces are unfruitful in grain, but the genial influence of the sun allows them other riches. The calcareous loam on the borders of the chalk formation is more productive. In Bretagne, Anjou, and Maine, are immense heaths. The *landes* are extensive tracts of sandy deserts, producing nothing but broom, heath, and juniper. The most extensive are the landes of Bordeaux, twenty leagues in length by twelve in breadth. In the remaining provinces, gravel, or a gravelly sand, is the predominating soil. The woods and forests are estimated to cover a space of 18,795,000 acres. The principal are those of Ardennes, Orleans, and Fontainebleau. The northern and western coasts are formed in a great proportion by immense downs or sandbanks; and where the shores are formed by cliffs, they are seldom bold enough to be approached with safety. The harbours are therefore few. On the Mediterranean, the coast of Languedoc is very dangerous, but Provence abounds in good harbours. The culture, throughout the northern half of the kingdom, consists of wheat, barley, oats, pulse, and of late, much more than formerly, of potatoes; in the southern half, corn (particularly maize), vines, mulberries, and olives. The eastern parts, being more elevated than the western, have more rigorous winters and more ardent summers. Coal and iron are found in abundance. The most common fuel is wood.

The superficial extent of France has been recently estimated by Baron Dupin at 53,533,426 hectares, or 132,694,000 English acres. The amount of capital invested in agricultural pursuits is estimated at 37,522,061,476 francs; the gross annual produce at 4,678,708,885 francs; the expenses of cultivation at 3,334,005,515; leaving a profit of 3¼ per cent. on the capital. The produce of wheat in the best cultivated districts, and on the best soil, hardly exceeds eighteen bushels per acre: an English farmer expects twenty-five on the same extent. In 1812, the number of horses in France was 2,176,000; but in 1819, the horses and mules together amounted only to 1,657,671; at present the number is estimated at 2,500,000. The number of horned cattle is 6,973,000; of sheep, about 45,000,000. The total number of all kinds of poultry is about 51,600,000. The French are the best wine-makers in the world. The Champagne, Burgundy, Claret, Hermitage, are universally celebrated. For a long time, the choicest growths were in the hands of the church; and in the frequent changes of property which have taken place since the revolution, many vineyards have deteriorated in consequence of bad management. The brandies of France are believed to be unrivalled. The value of the whole produce of wine and brandy is about 800,000,000 francs. The culture of the vine is supposed to have increased nearly one-fourth since the revolution, owing principally to the small proprietors, each of whom endeavours to supply his own consumption by a little patch of vineyard. M. Dupin says that many hectares of French territory are yet uncultivated, merely for want of cattle to stock and manure them; that two-thirds of the inhabitants are without animal food; that more than one-third subsist entirely on oats, buckwheat, rye, chestnuts, or potatoes, and that the agricultural population is too great for the prosperity of France. Two-thirds of the population is agricultural.

France possesses a soil and climate capable of furnishing her with all the raw materials of manufacture except cotton. The manufacture of fine woollen cloths at Sedan was introduced under the auspices of Colbert. The machinery used was very defective until M. Chaptal engaged an English machinist to instruct the French artisans. Steam-engines are rare; the spinning-mills being worked chiefly by water or by horses. The quantity of native wool manufactured in 1819 was 38,000,000 kilogrammes (of about 2⅞ lbs. each), and, in 1826, 42,000,000, with 8,000,000 of imported wool; the value of the manufactured articles was 265,000,000 francs; of the raw wool, 105,000,000: the quantity exported was about one-thirteenth of the whole quantity manufactured. By the exertions of Henry IV., the mulberry-tree was cultivated in all the southern provinces. At Tours, silk stuffs for furniture are chiefly manufactured; at Ganges, and other places in the Cevennes, silk stockings. Lyons is the principal place for silk manufactures of all kinds. Paris ranks next after Lyons. In 1812, the value of the raw material amounted to 45,560,000 francs, of which 22,000,000 were the price of imported silk. The value of manufactured goods, at the same period, was 107,560,000 francs, of which less than one-third was exported. Forty years ago, the spinning of cotton by machinery was hardly practised in France. Cotton mills have been established within that period, and the manufactures of Alsace are now superior to those of England in the brilliancy of their colours. In 1812, 10,362,000 kilogrammes of cotton were spun by machinery; and in 1825, 28,000,000 of greater fineness. The cambrics, gauze, and lawn of St Quentin, Valenciennes, and Cambray, are among the most valuable products of French industry. Lace is made in great quantities.

The whole produce of the linen and hemp manufactures is estimated at 200,000,000 francs. In 1814, 100,000,000 kilogrammes of cast-iron were produced; in 1825, 160,000,000. Gilding and watch-making are carried on, chiefly in Paris, to the annual value of about 38,000,000 francs each. Printing also employs a great number of persons at Paris. In 1814, the number of

printed sheets was 45,675,039; in 1820, 80,921,302; and in 1826, 144,561,094. Notwithstanding the low price of labour in France, the industry of that country cannot enter into competition with that of England. One of the circumstances which depress it is the want of internal communication by roads and canals. The practicable roads of France are not more than one-third of the extent of those of England. The cross-roads are few, and the great roads are seldom kept in good order. The length of the canals in France is not more than one-eleventh of those of England. Another point in which France is inferior is in the use of steam-engines, attributable in part to the deficiency of coal, or the difficulty of transporting it. The total force of steam-engines in France is reckoned to be equal to that of 500,000 men; that of England is equal to a power of 8,000,000 men. All the power derived from machinery of every sort, or from constructive ingenuity, and applied to purposes of industry in France, is only one-fourth of the similar power employed in England.

The commerce of France has been very much diminished by the loss of her colonies. The value of the colonial imports, in 1788, was 227,000,000 francs; in 1824, it was only 50,000,000. The exports for 1788 amounted to 119,000,000; in 1824, to 44,000,000. The total value of exports from France in 1824 was 440,542,000 francs; of which 163,056,000 were productions of the country, and 277,486,000 manufactured articles. The amount exported to the United States was 55,000,000, being more than that to any other country. The imports for the same year were of the value of 454,861,000 francs; of which 272,873,000 francs were raw materials for manufacture, 121,957,000 natural productions for consumption, and 60,030,000 manufactured articles.

The French are descendants of the Roman provincials and ancient Gauls, and hence their language is a mixture of modified Latin and the tongue of the original inhabitants, but much altered in orthography and in tone of speech in modern times. The kingdom was for many centuries governed in a despotic manner by a line of sovereigns of different dynasties, from Clovis in the year 481, to that of the Bourbons in the person of Louis XVI., 1793. One of these monarchs, Louis XIV., who reigned during the latter half of the seventeenth century, exhausted the resources of the nation in foreign wars and personal extravagance, and, besides, greatly corrupted the manners of the people. This laid the foundation of a course of events which terminated in the national ruin and fearful outbreak of the revolution in 1789. This revolution deluged the country in blood, and ended with the establishment of a republic; but this was speedily succeeded by the elevation of Napoleon Bonaparte, first as consul, and next as emperor. The career of Napoleon closed in 1815, with the battle of Waterloo, and the Bourbons were restored by the arms of Britain and other nations. The Bourbons were expelled in 1830, since which period the reigning monarch has been Louis Philip, a descendant of the brother of Louis XIV., and in whose male descendants the monarchy is hereditary.

On the establishment of the present limited monarchy in 1830, the national constitution was reorganised on the following footing:—The king is the supreme head of the state; he commands the land and sea forces, declares war, makes treaties of peace, alliance, and commerce; appoints to all offices of the public administration, and makes all the regulations and ordinances necessary for the execution of the laws under the responsible advice of his ministers. Any of the three branches of the legislature can propose laws; the Chamber of Peers may sit without that of the Deputies only as a court of justice; peers may speak in the house at the age of twenty-five years; princes of the blood may sit in the House of Peers without a special summons from the king; the deliberations of the peers are public; the renewal of one-fifth of the deputies every year is abolished; persons are eligible as deputies at the age of twenty-five years; the deputies elect their president without the concurrence of the king; and the electors choose the officers of the electoral colleges without the interference of the king; articles 46 and 47 of the old charter, respecting amendments, and the adoption of the tax acts by the deputies, previously to being sent to the peers, are repealed; as is also article 56, exempting the ministers from impeachment, except for treason or extortion; the *prevôtal* courts are abolished; the king takes the constitutional oath, not at the time of the coronation, but on his accession, as in England. Besides this, provision is to be made, by separate laws, for—1. The trial of offences of the press by a jury; 2. The responsibility of ministers, and other agents of power; 3. For the re-election of deputies promoted to offices with salaries; 4. The annual vote of supplies for the army; 5. The organisation of the national guard; 6. The settling the rank of all naval and military officers; 7. Departmental and municipal governments founded on the elective system; 8. Public instruction provided for; liberty of teaching allowed to all; 9. The abolition of the double vote, and of the electoral candidates and their eligibility. The charter is intrusted to the protection of the national guard, and the patriotism of the nation. The charter, with the "changes and modifications expressed in the declaration of the Chamber of Deputies," was presented to Louis Philip, who, on the 9th of August 1830, took the constitutional oath; and thus the *constitution octroyée* was changed into a real contract between the ruler and the people.

By the letter of these provisions, France possesses a free constitutional government; but such is the influence of the executive, that practically the people enjoy much less liberty than the British. So unsettled, likewise, is the system of things, that a large standing army and militia force (National Guard) has to be maintained, at a heavy expense and inconvenience to the nation. In 1837, the army amounted to 300,000 men. The national expenditure in 1838 was about £44,000,000, to which the revenue was inadequate: the national debt at the same time amounted to 254,566,496 francs. The French navy, in 1836, consisted of 49 ships of the line, 62 frigates, 31 corvettes, 49 brigs, and with other vessels amounted to a total of 321.

Previously to the revolution of 1789, the Roman Catholic was the established religion, and the country contained a vast number of monasteries and convents. Latterly, since 1830, there has been no established church, but the Roman Catholic worship predominates, and is adhered to by the reigning family. In 1836 there were 14 archbishops, 66 bishops, 174 vicars-general, 660 canons, 3401 curés, 26,776 desservans, and 6184 vicaires—total of clergy, 37,275. The bishops have each about £600 a-year of salary, and the working clergy from £20 to £60 each. There are about 1,000,000 of Protestants in France. The entire cost to the state of religious establishments, Roman Catholic, Protestant, and Jewish, amounted in 1838 to 35,443,500 francs. With respect to education, France at present possesses 26 universities, 363 high-schools, or academies, in the large towns and districts, 73 normal schools for training teachers, 873 boarding-schools, 36,000 elementary schools for boys, and 11,000 elementary schools for girls. The whole are under the supreme direction of the minister of public instruction; and the total cost, in 1838, was 19,005,673 francs, or nearly £800,000.

France possesses a considerable number of towns, with populations of from five to thirty thousand, and more particularly about twelve thousand, but not many of any consequence with a larger amount of inhabitants. Paris, the capital, in 1827, had a population of 890,531, which is about half the amount of the population of London. The other chief towns are Lisle, with a population of 69,860; Rouen, 90,000; Strasburg, 49,708; Nantes, 71,739; Boulogne, 19,314; Havre, 21,049; Rheims, 34,862; Brest, 26,655; Cambray, 17,031; Lyons, with suburbs, 170,875; Marseilles, 115,943; Toulon, 30,171; Aix, 23,132; Grenoble, 22,149; Clermont, 30,010; Besançon, 28,795; St Etienne, 30,615; Dunkirk, 24,517; Amiens, 42,032; and Orleans, 40,340.

chief port in the north of France is Havre, on the Channel, and Marseilles and Toulon are the principal outlets on the south. In point of capability maritime trade, France is far inferior to Great Britain from its want of good harbours, though perhaps this circumstance is of less consequence than the peculiarities of the people, which is adverse to naval ventures.

Paris, the capital, is a beautiful city, built of white stone, situated on a flat ground, on both banks of the river Seine. Here reside the most learned and accomplished men in France, and also the court of the king in the palace of the Tuileries. At a few miles' distance is Versailles, a royal residence of extraordinary extent, built by Louis XIV., and since considerably improved. Paris has been long distinguished as a place of resort for literary and scientific characters, and in the present day is the place of publication of an immense number of books in all departments of literature; it is also celebrated as a depôt for works in the fine arts, painting, engraving, and sculpture, in which it is rather in many respects in London. The character of the French people has usually been represented as exceedingly frivolous, but in this there has been much exaggeration; and it is certain that in recent times they have demonstrated an anxious desire for improvement in the useful arts, and for a settled form of government.

SPAIN AND PORTUGAL.

Spain, or the Peninsula, as it is frequently called, is an extensive country, occupying the south-western extremity of Europe between latitude 36° and 44° N. and surrounded by the Atlantic Ocean and the Mediterranean Sea, except on the north-east, where part of the Pyrenean chain of mountains forms its boundary with France. In its dimensions, this country extends 700 miles in length by 500 in breadth, forming an area of 200,000 square miles. Portugal, afterwards to be mentioned, lies like a patch on the side of the Peninsula, facing the Atlantic. Spain, proper, is divided naturally into two principal compartments, one of which includes the central region, and the other that of the coast. The first is essentially mountainous. It consists chiefly of extensive plains traversed by lofty ridges, towering to the height of from eighteen hundred to two thousand feet. There are comparatively few trees in the country, and the air being dry, the number of rivers is not great. The principal are the Ebro, Douro, Tagus, Guadiana, and Guadalquiver; but from the bad system of things, they are not put to their full uses for navigation and trade. On the lower parts of Spain, particularly on the coast, the climate is delightful, but in the high central plains the heat is as intense in summer as the cold is severe in winter. The productions of Spain are rich and various. Iron, tin, copper, quicksilver, and indeed every valuable mineral, abound in the Peninsula. There are also a number of coal and salt mines. Wheat of the finest quality is produced in most of the provinces. The other principal productions of the soil are rice, barley, maize, rice, oil, honey, sugar, hemp, flax, cork, cotton, silk, and barilla; the wool, as is well known, is of a very superior quality. There are many fine fruits grown, as figs, oranges, pomegranates, lemons, &c. Among the animal productions, the horse of Andalusia, a province on the Mediterranean, opposite Africa, is esteemed among the finest in the world. The sheep are millions in number; and the sea-coast supplies abundance of fish.

The country is divided into 14 provinces or districts, as follow:—Navarre; Biscay; the Austrias; Galicia; Leon; Catalonia; Leon; Old Castile; New Castile; Estremadura; Valencia; Andalusia, including Cordova, Seville, and Granada; Murcia; and the Balearic Isles in the Mediterranean. The capital, and seat of the Cortes or parliament, is Madrid, in the province of New Castile, at the centre of the kingdom. Population in 1823, 201,344. The principal seaport is Cadiz.

About the *beginning of the present century*, the population of Spain amounted to 10,450,879 individuals, among whom were the following classes:—Beginning with the religious bodies, there were 140,242 clergy and monks, and 32,000 nuns, exclusive of about a fourth of the population living on their property without doing any thing; there were 100,000 individuals existing as smugglers, robbers, pirates, and assassins, escaped from prisons and garrisons; about 40,000 officials appointed to capture these, and having an understanding with them; nearly 300,000 servants, of whom more than 100,000 were unemployed and left to their shifts; 60,000 students, most of whom begged, or rather extorted, charity at night; and if to this melancholy list we add 100,000 beggars, fed at the doors of monasteries and convents, we shall find that there existed in Spain nearly 800,000 persons who were of no use in agriculture or the mechanical arts, and who were only calculated to prove dangerous to society. Having made these, we find there then remained 964,471 day-labourers, 917,197 peasants, 310,729 artisans and manufacturers, and 24,333 merchants, to sustain by their exertions upwards of ten millions of inhabitants. These results, which are as applicable at the present day, when the population has increased to about 14,000,000, as at the time when they were deduced, exhibit a state of society so radically corrupt and debased, as to render all hopes of its regeneration very nearly desperate. Lately, on the death of Ferdinand, the reigning monarch, the queen, in the capacity of regent, made a powerful attempt to establish constitutional government, which was the first step towards practical reform of abuses. Her daughter Isabella, according to the will of Ferdinand, was proclaimed queen, whereupon ensued a civil war betwixt her forces and those of her uncle Don Carlos, who wished to assume the sovereignty. This war has greatly injured Spain, and what its results may be no one can foretell.

Portugal, which lies on the western frontier of Spain, facing the Atlantic, and measures 41,500 square miles in extent, is an ancient small kingdom, intimately resembling Spain in almost every particular, and at present in much the same unsettled condition. The country possesses two fine rivers, the Douro, which forms the great maritime emporium of Oporto, and the Tagus, which is that of Lisbon, the capital. Portugal is rich in natural productions, but wants the cultivation of industrious hands. The rich mines of precious metals are now neglected, on account of want of hands and fuel. The chief source of profit is in the fruits, which are exported in abundance, particularly the orange and grape. Wines of several sorts, port and sherry in particular, are produced, and exported chiefly to England. Agriculture, commerce, the arts, every thing in short, is neglected in Portugal, which in the present day is a miserable poverty-struck country. Like Spain, it is eaten up by clergy, secular and regular; and these classes have moreover rendered at least a third part of the year holidays, greatly to the loss of the nation. The late Don Pedro, father of the present queen Maria, had the address to abolish the monastic institutions, and to sequestrate the property to the state, which was an important measure of national regeneration.

The assumption of sovereignty by Maria led to a civil war or contest betwixt her forces and those of her uncle Don Miguel, which was most injurious to the country. Miguel was ultimately defeated and expelled. The population of Portugal was stated in 1826, at 3,214,000.

ITALY.

Italy, once the seat of the Roman empire, but which, since the overthrow of that power, has never formed an independent whole, is a narrow peninsula, extending from the Alps (46° to 38° N. lat.) into the Mediterranean Sea, which on the east side of Italy is called the Adriatic, on the west, the Tuscan Sea. The Apennines, rising near the maritime Alps, are the principal chain of mountains, and stretch through the country, dividing Lombardy from the Genoese terri-

tories and Tuscany, and Tuscany from Romagna, intersecting the states of the Church, and running through the kingdom of Naples to the Strait of Messina. Upper Italy (Lombardy) is remarkably well watered. The Po, which receives a great number of rivers from the large lakes at the foot of the Alps (Lago Maggiore, di Lugano, di Como, d'Iseo, and di Garda), and the Adige, are the principal rivers. They both rise in the Alps, and flow into the Adriatic Sea. In Middle Italy (Tuscany and the states of the Church) are the Arno and the Tiber, which rise in the Apennines, and flow into the Tuscan Sea. In Lower Italy (Naples) there are no large rivers, on account of the shortness of the course of the streams from the mountains to the sea: the Garigliano is the principal. The climate is warm, without excessive heat, and generally salubrious. The winter, even in Upper Italy, is very mild: in Naples it hardly ever snows. The abundance and excellence of the productions of the soil correspond with the beauty of the climate. In many places both of the north and south there are two, and even three, crops a-year. The volcanic character of the coasts of Lower Italy is particularly remarkable in a geological point of view, especially in the region of Puzzuoli and Vesuvius. The neighbouring islands of the Mediterranean are distinguished by the same character. The present number of inhabitants is much inferior to the former population of this delightful country, the total amount being 21,397,500.

The national character of the Italians, naturally cheerful, but always marked by strong passions, has been rendered, by continued oppression, dissembling and selfish. The Italian, moreover, possesses a certain acuteness and versatility, as well as a love of money, which stamp him for a merchant. In the middle ages, Venice, Genoa, Florence, and Pisa, were the chief marts of the European commerce with the East Indies; and Italians (then called Lombards, without distinction, in Germany, France, and England) were scattered all over Europe for the purposes of trade. The discovery of a passage by sea deprived them of the India trade, and the prosperity of those republics declined. The Italian, restricted almost solely to traffic in the productions of his own country, has nevertheless always remained an able and active merchant. Before Rome had (2100 years ago) absorbed all the vital power of Italy, this country was thickly inhabited, and for the most part by civilised nations. In the north of Italy alone, which offered the longest resistance to the Romans, dwelt a barbarous people, the Gauls. Farther south, on the Arno and the Tiber, a number of small tribes, such as the Etrusci, the Samnites, and Latins, endeavoured to find safety by forming confederacies. Less closely united, and often hostile to each other, were the Greek colonies of Lower Italy, called Magna Grecia. The story of the subjection of these nations to the Roman ambition, belongs to the history of Rome. Italy, in the middle ages, was divided into Upper, Middle, and Lower Italy. The first division comprehended all the states situated in the basin of the Po; the second extended between the former and the kingdom of Naples, which formed the third.

Italy is in modern times cut up into a number of distinct states, partly independent with native princes, partly under the rule of Austria, and a portion under the civil sway of the head of the Romish church. Throughout the greater part of this fine country the system of police is wretched, and robbery is exceedingly common; commerce, agriculture, and the useful arts, are in a low condition; bigotry prevails, and the national character is reduced to the lowest moral standard. The most civilised and best governed part of Italy is Tuscany, which differs very materially from the adjacent states. In the present day, Italy is only celebrated for its music, and its collections of works in the fine arts. The following sketch gives a view of the amount of population in the five great divisions into which Italy is partitioned.

The population of the states of the Church is about 2,600,000. The capital is Rome, the seat of empire of the ancient Romans, but now greatly altered in figure and appearance, and completely changed in character; this venerable city possesses a population of 150,000. The other chief towns are—Bologna, with a population of 65,000; Ancona, 30,000; Perugia, 30,000; Ferrara, 24,000; and Ravenna, 24,000. There are other eight towns, with a population of from 7000 to 14,000.

The duchy of Tuscany, in 1826, had a population of 1,275,000 inhabitants. The capital of this state is Florence, the population of which amounts to 80,000. The other chief towns are—Leghorn, 66,000; Pisa, 20,000; Sienna, 18,000; Prato, 10,000; Pistira, 9000; Avezzo, 7000; and Costona, 5000.

Austrian Italy, or the Lombardo-Venetian kingdom, which consists of the great plain of the Po, is subdivided into the governments of Milan, Venice, Parma, and Modena. The chief towns of the state of Milan are—Milan, 151,000; Brescie, 31,000; Cremona, 26,000; Mantua, 25,000; Pavia, 21,000; Lodi, 18,000; and Como, 7600. The chief towns in the state of Venice are—Venice 101,000; Verona, 48,000; Padua, 35,000; Vicenza, 19,000; Udina, 18,000; Treviso, 15,000; Belluno, 8000 and Rovigo, 7000. The state of Parma has the town of Parma, 30,000; Placentia, 28,000; and Guastalla, 5000. The state of Modena possesses the town of Modena, 27,000; Reggio, 18,000; and Mirandola, 6000.

The Sardinian States are composed of Piedmont, Genoa, Savoy, and the Island of Sardinia, the whole of these divisions having a population of 3,831,350. The principal town and sea-port in this district is Genoa, which possesses a population of 80,000 inhabitants.

The fifth division of Italy is composed of the states now included in the kingdom of the Two Sicilies. This forms the southern, and perhaps the finest portion of the Italian peninsula, and branches out into the two smaller peninsulas of Otranto and Calabria. Naples is the chief town, with a population of 354,000 inhabitants, being thus the largest city in Italy. Naples is famed for the beauty of its environs, particularly the bay on which it is situated, and for the exceeding fineness of its climate. Sicily, an island belonging to the kingdom of Naples, measures 180 miles long by 150 in breadth, and is one of the most beautiful islands of Europe. It is chiefly distinguished for its celebrated volcano, Mount Etna. Malta, an islet in the Mediterranean, about fifty-four miles to the south of Sicily, now belongs to the British government.

RUSSIA.

The Russian empire stretches over the half of Europe, and the whole of Northern Asia, from the Baltic to the Pacific, and includes vast territories on the north-western coast of North America. It lies between lat. 38° and 79° N. It is bounded on the north by the Northern or Icy Ocean, west by Norway, Sweden, the Baltic Sea, Austria, and Prussia, and south by Turkey, the Black Sea, Persia, the Caspian Sea, Independent Tartary, and China. The total superficial area is estimated at 8,000,000 square miles, of which about 1,500,000 are situated in Europe, and 5,600,000 in Asia. The Russian dominions compose about one-seventh of the habitable globe. The surface of Russia is generally level, and some tracts of land of this flat nature, frequently bleak and barren, are called steppes. The country also possesses chains of lofty mountains in different quarters. Russia raises vast quantities of corn, which it exports; and it produces fruits and wine in abundance. The forest also yields important articles of export. Cattle of all kinds, horses, and sheep, are likewise bred in immense numbers, chiefly for the exportation of their skins. The mines of the country are productive of platina, zinc, copper, quicksilver, alum, and salt, all which are continual sources of revenue. Russia possesses various rivers of the first

magnitude, and canals are in the course of establishment on a considerable scale.

The population of Russia, including Poland and Finland, is 57,000,000, of nine different races:—1. Sclavonians 44,000,000, including the Russians (42,000,000, among whom are the Cossacks, about 600,000 capable of bearing arms) and the Poles; 2. Finns, who are scattered over the country, from Tornea and the Niemen to the Obi (3,000,000); 3. Tartars, from the Dniester to the Caucasus (2,000,000), mostly under their own government, without agriculture or firearms; 4. Georgians or Circassians (2,000,000); 5. Samoiedes; 6. Mantchoos; 7. Mongols, to whom belong the Calmucks; 8. Eastern tribes (including Tchutsches, Kuriles, and Aleutians); 9. Jews, particularly in the Polish provinces. Besides these races, there are natives of almost all countries of Europe and Asia, as Greeks, Arabs, Hindoos, Gipsies, French, English, and Danes. There are among these Russian subjects eighty tribes, differing in language, religion, and manners, from the rudest state of barbarism to the highest degree of European civilisation. The population is divided into four classes, the nobility, clergy, common people or freemen, and peasants or serfs. In 1811, the number of persons subject to do military duty was as follows:—643,135 persons engaged in trade; 6,389,269 crown peasants; 10,113,177 peasants belonging to individuals; 1,077,636 appanage peasants; 112,453 freemen; in all, 18,335,730 men. We find manufactures of leather, tallow, candles, soap, felt, coarse linen, mats of the bark of the linden tree, hard-ware and the art of dyeing, among the Russians before the time of Peter the Great; but since his reign these have been carried to much greater perfection, and many new manufactures have been introduced. In 1815, Russia contained 3253 manufacturing establishments; twenty-three of these deliver to the government annually cloth of 700,000 roubles in value, and there are, besides, one hundred and eighty-one private establishments. Drugs are prepared in forty-five laboratories; and there are distilleries of brandy, of which 120,000,000 gallons are consumed in the country. Ship-building is carried on in the large villages on the Wolga and in the sea-ports.

The government is an unlimited monarchy; the emperor is autocrat of all the Russias; the state is indivisible; the ruler cannot be, at the same time, ruler of any other country (since 1815, however, he has been king of Poland), and must be of the Greek religion. In 1797, the succession was settled in the male line, by the rules of primogeniture, and, in failure of males, in the female line. All the princes of the blood are called grand-princes. By the ukase of March 20, 1820, it was declared that only the children of a marriage acknowledged by the emperor are capable of succeeding to the throne. The highest councils are, 1, the imperial council, under the presidency of the emperor, erected Jan. 1, 1810, with four departments—that of legislation (the supreme tribunal in civil and ecclesiastical suits), that of war, that of civil and ecclesiastical affairs, and that of finance; 2, the senate, for home affairs (a deliberative body, consisting of eight departments, three of which have their seat in Moscow); 3, the holy synod; 4, the ministry of state. The ministers have a seat and voice in the imperial council and in the senate. The ministry is divided into three sections—that of foreign affairs, war, the marine, the home department, ecclesiastical affairs, education, and finance; that of the imperial treasury; and that of the public accounts, roads and canals, and justice. The whole state is divided into fifty-one governments and several provinces; of these forty are in Europe, exclusive of the Cossacks of the Don, the Cossacks of the Black Sea, and the kingdom of Poland. The military force of Russia is exceedingly great, yet nothing to excite any dread. By some accounts it is stated as having totally amounted to 870,000 men; but a vast proportion of this force is composed of irregular militia, or armed slaves. It is considered by recent writers on the subject, that the utmost amount of regular force which Russia can bring into the field is 150,000 men, infantry, cavalry, and artillery. It is indisputable that Russia has no pecuniary resources to support a large army long in the field, and therefore any fear expressed by European powers on this score is ridiculous. The principal dependence of Russia is upon England, and a quarrel with the British government would most likely lead to a serious commotion in the state. The prevailing religion is that of the Greek church, with a full toleration of all religions. The state of society is a strange mixture of refinement and barbarism. The population is composed of four different classes, as has already been mentioned. The boors or peasants are the property of the crown or of individuals; they amount to about 35,000,000, and are in a state of great poverty. They are sometimes emancipated by their owners, and are sometimes permitted to purchase their freedom. The noble families are about 150,000, comprising 750,000 individuals, and enjoy some privileges and exemptions. The freemen, not nobles or clergymen, are divided into six classes—the inhabitants of cities, the three guilds (capitalists, according to their income tax), the trades, foreigners or strangers, the notable citizens (*savans*, artists, bankers), and the colonists. In regard to rank, these classes form fourteen gradations; and all who can claim either of the eight highest are considered as noble. Distinction of any kind, however, is only gained by the possession of a superior military rank.

Debased as Russia is, it has recently made great advances in civilised usages. Science, literature, and the arts, are highly cultivated, and liberally endowed. The Russians, it seems, have not much original genius, but they are the best imitators in the world, and quickly adopt foreign manners, language, and improvements. The wretched system of territorial slavery is gradually disappearing, and the peasants are now more protected by the laws than formerly. The punishment of criminals is also becoming more lenient. Russia possesses a number of towns of from 10,000 to 30,000 inhabitants. Petersburg, the capital, has a population of 425,000, and Moscow 240,000. Petersburg, which is built upon the flat banks of the Neva, is considered to be in appearance the most splendid city in the world.

GERMANY.

Germany as it is called by the English, l'Allemagne by the French, and Deutschland by the natives themselves, is a large territory extending from the Baltic Sea on the north to the Gulf of Venice on the south, having Hungary and Russia on the east, and France and the Netherlands on the west. At its south-west corner it is touched by Switzerland. This immensely large territory occupies the bulk of the centre of Europe, and consists of an area of 250,000 square miles. The most remarkable circumstance about Germany is its being composed of a considerable number of states, each less or more independent within its own bounds, but externally dependent on the other states of the confederation, as is mentioned already under the head Constitutional Governments. Altogether, there are thirty-four monarchical states, and four free cities, which enter into a confederation as equal sovereigns. For mutual safety they compose a diet or congress, at which each state has a certain number of votes. The principal states of Germany are Prussia and Austria; Saxony, Bavaria, and Hanover, are of lesser dimensions and importance. The others do not require any notice.

In the days of Roman greatness, Germany, or Germania, as it was then called, was inhabited by a barbarous but powerful people, reckless of control, and ambitious of securing the spoils of richer nations. They broke loose at different periods, overrunning Italy and other fair portions of Europe, and, under the general appellation of Goths, finally prostrated the empire of Rome. The term Goth is now used in a contemptuous sense, but it has to be remarked that modern Europe stands indebted for its liberties to the Goths. The free institutions of Germany were carried

into England and other countries, where they have since grown and flourished; and in later times the world has received various useful arts from the same source, in particular the art of printing, which transcends all other inventions. In the eighth century, Charlemagne united the Roman imperial crown (a thing merely so in name) with the German empire, and the great territory we are speaking of was thenceforward called the Holy Roman empire of Germany. This empire lasted till its dissolution in 1806; but long before that era Germany had been broken up into states, by the enterprise of its native dukes and princes, and the name empire was little else than nominal. In 1815, the states entered into the confederation which now binds them.

This large confederated country is watered by 500 rivers, of which the principal are the Rhine, the Danube, the Weser, the Elbe, and the Oder. The most southern chain of German mountains is formed by the Tyrolese Alps, the Alps of Algau, and the Carnian and Julian Alps, running from east to west. To the south-east are the Carpathian mountains, to the north-west the Bohemian forest. There are also alpine regions on the Upper Rhine. In Northern Germany there are sandy heaths and moors, and many districts contain fertile strips only along the large rivers. On the whole, the soil is fertile, and the climate in general is temperate and healthy. The number of inhabitants is estimated at nearly 40,000,000, in 2390 towns, of which 100 have over 8000 inhabitants; 2340 market villages; 104,000 villages, and numerous small settlements. Of the inhabitants, there were in 1825, Germans, 27,705,855; persons of Slavonic origin, 5,325,000; Walloons and French, 309,000; Jews, 292,500; Italians, 188,000; Gipsies, 900; and Armenians and Greeks, 900. In the same year, the number of persons of different religious persuasions was as follows:—Roman Catholics, 18,376,300; Protestants, 15,150,500; Jews, 292,500; Greeks and Armenians, 900. It should, however, be stated, that in this enumeration there are in all likelihood many religionists who are altogether unsettled in belief, although ostensibly belonging to some communion; for in no country in the world is there such latitude in thinking upon points of faith. Germany contains 24 universities, which are attended by about 30,000 students—a class of wild young men, having habits and an appearance very different from what usually characterise attendants at colleges in Great Britain. The publishing and reading of books prevail to a great extent in Germany, which is essentially literary in its tastes. There are public libraries in 150 places, with about six millions of volumes. Ten thousand authors produce annually from about 3500 to 5000 new books. There are about 100 political journals, 220 other journals, and at least 150 periodical publications. Most of the best English productions are regularly translated and printed in Germany. It is curious that, with all this abundance of literature, and the prevalence of education, with also freedom of religious opinion, Germany is far from being a free country. It is despotically ruled by great or petty sovereigns, has only here and there the mockery of representative government, and the people in the mass are destitute of the power to better their condition. Germany, from which all our freedom sprang, is itself ranked among the least free of the nations of Christendom.

One of the chief of the small German kingdoms is Saxony, lying in the centre of Europe, and consisting principally of the plain of the river Elbe, in its upper part, with a population of 1,700,000 inhabitants. It is rich in agricultural produce, and feeds about a million and a half of sheep, the wool of which is remarkably fine and valuable. Saxony has various flourishing manufactures, linen and woollen goods being the staple. It carries on a brisk trade with various parts of the The grand centre of its commerce, and indeed Germany, is at Leipsic, one of its chief towns. *at fair is annually held*, which is attended by *from all parts of Europe*, and at which, in *the sale of books is* very great. The most elegant town in Saxony is Dresden, situated up banks of the Elbe.

Germany possesses four free cities, acting a pendent states within their own bounds, and indiv entitled to vote in the Germanic diet; namely burg, Lubeck, Bremen, and Frankfort-on-the- The independence of these towns is a remna confederacy of cities, which was established thirteenth century, under the name of the Ha League. Besides these four free cities in Germa Polish city of Cracow was declared a free city general act of the Congress of Vienna, and is un protection of Russia, Austria, and Prussia. Ha situated upon the Elbe, which flows into the Nor is one of the chief commercial and maritime Europe. It possesses a population within its te of 150,000 inhabitants.

AUSTRIA.

Austria is a monarchy now forming one of th ing powers of Europe, and is usually esteem principal of the German states. Only a portion territory, however, belongs to Germany. As a ment, it includes a number of ancient states, have been acquired and added in the course of a series of ambitious sovereigns. These are (in a to Austria Proper, composed of Upper and Austria), Bohemia, Moravia, with the alpine re Styria, Carinthia, and the Tyrol; several of the provinces, now called Gallicia; the kingdom o gary, and the Lombardo-Venetian kingdom in This great country is governed by an absolute who takes the title of emperor. It comprise than 256,399 square miles, and upwards of thi millions of inhabitants. Of these it is reckon there are twenty-two millions of Roman Catholic millions of the Greek church, two millions of tants, and half a million of Jews. The militar of the monarchy in 1819 amounted to 270,00 independent of militia. Austria numbers 777 2224 market towns, and 69,105 villages. Th populous cities are Vienna, Milan, Venice, Le and Padua. The principal sea-ports are Trieste, and Fiume; other places of trade are Vienna, Pesth, Lemberg, Brody, and Gratz.

The capital of Austria is Vienna, which is of great extent, situated on the Danube, and improved in modern times. Latterly, much h done in Austria to establish schools and educ people, by which they may ultimately be prepa the enjoyment of political freedom. Meanwhi improvements are taking place in the condition nation by the extension of trade and commerce, navigation, roads, &c.

PRUSSIA.

Prussia is one of the most remarkable kingd Europe. It has risen from nothing at the be of last century to be one of the principal com nations. The increase of its size from its dimensions, as the duchy of Brandenburg, to t dition of a first-rate kingdom, has been effected intrepidity of its people and the military charact sovereigns, particularly of Frederick II., or the Prussia, as now constituted, lies in the northern of Europe, with the Baltic Sea on the north, and on the east. It comprises the districts or prov East and West Prussia, Posen, Pomerania, B burg, Silesia, Westphalia, and the Rhenish pr which divisions include the portion of Polan was taken by Prussia at the partition of that unfortunate kingdom. The aggregate extent of the different territories amounts to 107,472 square miles, wit population of 12,500,000, upwards of eleven mil which are Germans. Prussia is considered to be weakened as a power by its large scattered of territory. The kingdom has three vulnerabl

towards Russia, Austria, and France; hence its situation is dependent. It is compelled to keep up a large military force, consisting of 180,000 regular troops, with so large an addition of irregulars, as make up in all nearly half a million of soldiers. The king of Prussia is an absolute monarch, yet he is surrounded by a spirit of freedom which necessarily influences his actions. One of the most striking features of this monarchy is the care which it bestows on science and education. The sciences are nowhere fostered with more care, and there are few countries in which common schools are more widely diffused. (See our article EDUCATION.) Prussia carries on some maritime trade by means of the Baltic, and its inland trade is promoted by the rivers Oder, Vistula, Elbe, and Saale, the Rhine, Memel, Pregel, Warta, Netze, Hanel, Spree, Weser, Moselle, &c., which either flow through Prussia or belong to it. Nine and a half millions of the inhabitants of Prussia are of the Reformed Church, and four and a half millions are Catholics.

SWITZERLAND.

Switzerland is a mountainous territory, occupying the alpine regions betwixt France and Germany, and having Italy on the south. This beautiful and romantic country has, from time immemorial, been occupied by a hardy and independent race of inhabitants, mostly attached to republican forms of government, and always ready to defend their rights and their country from the aggression of the great powers in the neighbourhood. Switzerland measures about 300 miles in length by 140 in breadth, and is supposed to contain 19,000 square miles. Politically, the country is divided into twenty-two small states or cantons, generally independent of each other, but confederated for purposes of mutual protection. Some states are more free in their forms of government than others. The total population amounts to two and a half millions, of which upwards of one-half are Protestants, and the remainder chiefly Roman Catholics and Jews. The German language is used in most cantons.

Geneva is the smallest but most populous state in proportion to its size, and in this canton is situated the town of Geneva, upon a beautiful lake of about fifty miles in length and eight or ten in breadth. The highest mountains of Switzerland are found in the cantons of Uri, Berne, Underwalden, and Grisons. Of about sixty Swiss mountains which have been measured, the highest is Monte Rosa, 15,535 feet high; the lowest, Chalet, is 3000 feet high. Mont Blanc, within the limits of Savoy, is the highest mountain in Europe, being 15,668 feet high. The mountains of Switzerland are pastoral in their lower parts, and in many instances covered at top with perpetual ice, the icy coverings being here characteristically named *glaciers*. The continual alternation of hill and dale affords the most striking natural scenes in every part of Switzerland. In some places, within a short distance, one may see at the same time all the seasons of the year; and it is often possible to stand between spring and summer, so as to collect snow with one hand, and to pluck flowers from the soil with the other. Every mountain has its waterfalls: and as their sources are sometimes lost in the clouds, the cataracts seem to descend from the skies. Switzerland abounds in lakes and rivers, the fisheries of which are valuable, and which serve to embellish the landscape; but none of the rivers are navigable. Small steam-vessels now ply on the lakes of Geneva, Zurich, Constance, and Neufchatel, and are a great convenience to travellers. The chief rivers are the Rhine, the Reuss, the Rhone, and the Tessino. The cultivation of the vine is carried on to a considerable extent in Switzerland; the breeding of cattle is, however, the chief employment of the inhabitants. Swiss cheeses are imported in great numbers into Germany, France, and Italy.

Manufactures of silk, cotton, and linen, have of late years greatly increased in Switzerland, which is rivalling England in some kinds of goods, particularly printed calicoes. Recently great improvements have been made upon the roads through this attractive territory, and travellers are now well accommodated on all the main routes.

The people of Switzerland form one of the best educated, most industrious, and best behaved nations in the world; and consequently they are generally happy and in good circumstances. Although the country does not any where touch the sea, and all goods have to be carried many miles by land journey through other states, the Swiss possess a thriving system of trade and commerce, and are rapidly advancing in a career of national prosperity, thus proving that nothing is denied to good conduct and industry.

NORWAY, SWEDEN, AND DENMARK.

These, with the province of Finland, form the north-western frontier of Europe, facing the North Sea or German Ocean, and reaching to the shore of the Baltic on the south. Norway lies on the shore of the North Sea, Sweden is behind it with its southern extremity to the Baltic, and Denmark is formed by the peninsula of Jutland, projected northwards from the Netherlands and kingdom of Hanover into the mouth of the Baltic. Norway and Sweden are now erected into a kingdom, under one sovereign, much in the same manner as England and Scotland are united. Bernadotte, one of Bonaparte's commanders, has for a number of years been the reigning monarch. The united kingdom measures 1550 miles in length by about 350 in breadth. The country is mostly mountainous and pastoral, and covered with dense forests, producing the finest timber in the world. The climate is dry and cold, but that of Sweden is warmer than that of Norway. The mineral kingdom is rich, particularly in iron, copper, and silver. The inhabitants of these countries are of the ancient Scandinavian races; hardy, honest, industrious, and kind-hearted. In the sciences, the Swedes have shown a sound and penetrating mind. The two kingdoms, Norway and Sweden, had, in 1825, a population of nearly four millions of inhabitants. Stockholm, the capital, had a population of nearly 80,000; Gottenburg, the principal commercial city, had 24,000; Christiana, the capital of the Norwegian division, had 20,600; and Bergen, the chief commercial city in Norway, 20,800. Few towns, however, number more than 4000 inhabitants, and many have scarcely 500.

The Danish monarchy is composed of the peninsula already mentioned, with some islands and detached portions. The principal of the attached territories are the duchies of Holstein and Lauenburg; likewise the Feroe Islands, in the North Sea; Iceland; the western coast of Greenland; some places in Guinea; and the city and territory of Tranquebar, in the East Indies. The exact measurement of so scattered a territory is of little moment; and it is sufficient to state, that Denmark Proper and the duchy of Scleswick contain 17,375 square miles. Denmark Proper is estimated to contain 1,230,000 inhabitants; Holstein and Lauenburg, 370,000; and the total population under the monarchy amounts to something under two millions. The people are partly Danes and partly Germans. Denmark is a level country. The coasts are low, and protected from the sea by dykes. The soil consists partly of marshes and heaths, and is on the whole but moderately fruitful. By the improvident extirpation of the woods which protected the north and north-western coasts of Jutland against the sea, vast extents of fruitful territory have become barren and sandy deserts. The staple productions are grain, rapeseed, and tobacco; and the breeding of cattle forms a principal source of profit. Denmark now contains, without including Iceland and the Feroe Islands, 100 cities, 73 boroughs, 2305 parishes, and 5500 villages. The government is an absolute monarchy. Copenhagen, situated on the east coast of the island of Zealand, is the capital, and contains a population of 105,000 inhabitants.

HOLLAND AND BELGIUM.

These countries, under the general appellation of Netherlands, occupy a large flat territory stretching southward from the confines of Denmark on the north, to France on the south; having Prussia and the small kingdom of Hanover on the east, and the North Sea or German Ocean on the west. They therefore form that part of the continent of Europe which lies opposite the east coasts of Scotland and England. The entire extent of the Netherlands amounts to 24,870 square miles. Through the centre, from east to west, flows the Rhine, one of the finest rivers in Europe, and which parts into a number of channels before pouring its waters into the ocean. On the lower part of one of these channels stands Rotterdam, a large and flourishing commercial city. The surface of the Netherlands is flat, and rich in the luxuriance of vegetation. So low is the land that it has to be protected from the sea by dykes or embankments. The country is every where intersected with canals, which are of prodigious use for commercial and general intercourse. Locally, the Netherlands are divided into a number of districts, among which the old Flemish or Flanders provinces find a place. The whole territory is nearly equally divided into the two distinct states of Holland and Belgium.

Holland is that part of the Netherlands which lies on the north-east side of the Rhine, while Belgium is upon the south-western side, or nearer to France. Holland is composed of the following provinces: North Brabant, Guelderland, North Holland, South Holland, Zealand, Utrecht, Friesland, Overyssel, Groningen, and Drenthe, being ten in number, containing in 1833 a population of 2,444,550. Of these there are 1,541,748 Protestants, 836,920 Roman Catholics, and 45,493 Jews, besides a few thousands of other sects. The country, however, is essentially Protestant, notwithstanding that all sects are freely tolerated, and their clergy paid on a nearly equal principle by the state. The established church is Presbyterian, resembling that of Scotland both in discipline and doctrine.

Holland has been for ages a commercial country, its people chiefly subsisting in some way connected with ships and maritime traffic. It is, however, not at present advancing very sensibly, owing to the people's want of enterprise, and their hatred of modern inventions and improvements. Since 1830, when the kingdom of the Netherlands was divided by a revolution into Holland and Belgium, the country has been governed separately by a constitutional monarchy. The Hague is the capital of Holland, where the government is conducted, but Amsterdam is the chief town, both for commerce and amount of population—its population was some years since upwards of 200,000. The language of Holland is a species of German, spoken nowhere else in Europe.

The districts or provinces of Luxembourg and Limburg are now considered to belong to Holland. Luxembourg lies on the south of Belgium, and Limburg in the lower valley of the Meuse, on the Belgian side of the Rhine.

Belgium, the country of the ancient Belgæ, and in later times the country of the Flemings, now consists of the provinces of Brabant, Antwerp, East and West Flanders, Hainault, Namur, and Liege, the whole measuring 12,000 English square miles, and containing 4,000,000 of inhabitants. The people of Belgium are from the same original stock as the Dutch, but circumstances have made them widely different in manners. Belgium was long held in subjection by Spain and Austria, and afterwards was attached to France, and partly from this cause the prevalent religion is Roman Catholic, and the language chiefly French. These two peculiarities give a turn to the national feelings. The Belgians, though as industrious as their neighbours the Dutch, are less steady in purpose, and more enterprising. Nevertheless, they are now a thriving people under a constitutional monarchy, with Leopold as their ki and many improvements are at present in operation in the country. Brussels, a beautiful large town in Brabant, is the capital—population about 80,000. The manufactures, internal traffic, and commerce of Belgium, are undergoing a rapid extension. The towns next to Brussels in size and importance are Antwerp, a sea-port on the Scheldt, Ghent, Bruges, Louvain, and Liege. The two main rivers are the Meuse, which falls into the Rhine, and the Scheldt.

TURKEY.

Turkey is a territory partly in Europe and partly in Asia, and is inhabited by an Asiatic-Tartar race called Turks, who in the year 1453 conquered that portion lying within the confines of Europe, formerly the metropolitan part of the western empire of the Romans, and have there ever since, at Constantinople, held a barbarous sway of this beautiful district of Europe. Turkey in Europe is separated on the south-west from Asia only by a long range of straits called the Dardanelles, and by the Black Sea, and is bounded on the northern side by the dominions of Austria and Russia. On the west it has the Adriatic Sea, which in part separates it from Greece, till lately a portion of itself. The Turkish monarchy nominally possesses Egypt and some other possessions in Africa; but, not computing these distant territories, it may be estimated that Turkey in the present day measures in Europe 178,928 square miles (but including the insecure provinces of Moldavia, Wallachia, and Servia), with a population of upwards of nine millions of inhabitants; and in Asia 425,000 square miles, with a population of above ten millions. The bulk of the population in both regions is Mahommedan, and uncivilised. The climate of Turkey is among the most delicious in the world; its soil is generally productive, and its natural appearance is beautiful.

Constantinople, the capital (called Stamhoul by the Turks), situated on the Dardanelles, a strait betwixt the Mediterranean and Black Sea, is a large and populous, though crowded and inconvenient city, excellently situated for trade, communications being carried on with it by the Mediterranean on the west, and the Black Sea on the east. Every region in Turkey yields its productions in abundance. The staple articles of export are wheat, rice, cotton, tobacco, silk, figs, and other fruits; hair, wool, and opium. Mining is totally neglected; and there is in general little manufacturing industry in the country. The inhabitants are at once extremely ignorant, proud, and slothful, and the commerce carried on is chiefly in the hands of Jews and Christians. The spread of knowledge has been sedulously prevented; printing, till lately, was carried on only by Armenians, Jews, or Greeks; and transcribing books with the pen is pursued as a common employment. Painting and sculpture are neglected, because the Koran, or Bible of the Mahommedans, forbids the imitation of the human form. A great effort was lately made by the sultan Mahmoud to introduce some civilised usages, and, among other improvements, he established a newspaper at Constantinople, in French and Turkish.

The sultan, as caliph, or successor of the prophet Mahommed, enjoys the character of Pope to the Mahommedan world, and unites the highest spiritual dignity with the supreme secular power. He has unlimited control over the property and lives of his subjects, especially of the highest officers of state, whom he can remove or put to death at will. The people have no rights. Merit, or favour, or intrigue, can raise the lowest to the highest stations. There is no hereditary nobility. The succession to the throne is hereditary in the family of Osman; the will of the people and of the janizaries has often decided upon the individual. Women are excluded from the succession. The padishah or sultan is not crowned; he is merely girded with the sword of Osman, after he has sworn to uphold the religion of Mahommed. The women of his harem are for the most part Circassians or Georgians, who have been purchased as slaves. On account of this plurality of wives, and the number of male descendants, there is generally a contest for the throne at the decease

ery monarch. Lately there has been some ...ement in this respect; still the whole arrange... the a regular succession are on a precarious ...

A ...national monarchy, *not very well organised, has* ...been imposed on the newly erected nation by the European powers, with Otho, a Bavarian prince, as king. Athens, the chief town or capital, is now undergoing improvements, and frequently visited by strangers. The population of the continental part of Greece is stated at three millions, and nearly half a million for the islands adjacent.

ASIA.

Asia, which forms the eastern and northern portion of the great tract of land in the eastern hemisphere, is the oldest known portion of the globe, and is usually called the cradle of the human race, of nations, and of arts. It is separated from Australia by the Indian and Pacific Oceans; from America on the north-east by Behring's Straits, and on the east by the great Eastern or Pacific Ocean; from Africa by the Arabian Sea (with which is connected the Persian Gulf), and by the Arabian Gulf, or Red Sea, with the straits of Babelmandel; from Europe by the Sea of Azoph, with the Straits of Caffa, by the Black Sea with the Bosphorus, by the Sea of Marmora and the Dardanelles, and by the Grecian Archipelago. On the other hand, it is united with Africa by the desert Isthmus of Suez, and with Europe by the waters of the Wolga, which rises near the Baltic, and falls with the Ural into the Caspian Sea.

The area of Asia is about 16,175,000 square miles. It extends from 26° to 190° E. longitude, and from 2° to 78° N. latitude. Its greatest breadth, from north to south, is 4140 miles, and its greatest length about 8000. It is four times larger than Europe. It is divided into 1. Southern Asia, comprehending Natolia, Armenia, Curdistan, Syria, Arabia, Persia, Hindostan, Farther India, Siam, Malacca, Annam, Tonquin, Cochin China, Laos, Cambodia, China, Japan; 2. Middle or Upper Asia, containing Caucasus, Tartary, Bucharia, Mongolia, Tungousia; 3. Northern or Russian Asia, from 44° N. latitude, containing Kassan, Astrachan, Orenburgh, Kuban, Kabarda, Georgia, Imireta, Siberia, with the alpine regions of Daurria and Kamschatka.

The large portion of Asia composing the northern and middle divisions, inhabited by wandering Tartar races, possesses little interest, and is generally viewed as little else than a great wilderness. The parts which are important, either from their historical interest, or their present condition, are the three lobes or masses of land, partially jutting out from the continent on its southern side; the first, on the west, comprehending Arabia, Syria, and Persia; the second, or mid part, Hindostan or India; and the eastern part, China and Japan. Arabia is a fine large peninsular tract lying betwixt the Persian Gulf on the east, and the Red Sea on the west. It contains about 1,000,000 square miles, and is situated between the 12th and 30th degrees of north latitude. Its chief towns are Mecca and Medina, near the shore of the Red Sea. The southern portion is entitled Arabia Felix, or the Happy, and its northern part Arabia Petræa, or the Rocky. Adjacent to this northern division, and stretching along the border of the Mediterranean Sea, is Syria or Palestine, the ancient country of the Jews, but, along with the surrounding country, now held in subjection by the Turkish power, and in a state of barbarism. A description of PALESTINE is elsewhere given in the present work.

The district of country anciently termed Asia Minor, but now forming part of Turkey in Asia, and called Natolia or Anatolia, is a territory 650 miles long and 400 broad, having Armenia and Syria on the south, and the Mediterranean on the west. It is a fruitful and delightful part of Asia; its principal town and sea-port is Smyrna, with which a considerable traffic is carried on with western Europe.

Persia lies on the eastern shore of the Persian Gulf, between the 25th and 40th degree of north latitude. It has the Caspian Sea, or a great inland lake, on the north, and the Arabian Sea on the south. It comprises about 390,000 square miles, with a population of about 6,500,000. The people are Mahommedans, and in a

semi-barbarous condition, governed by a shah or despotic sovereign. Ispahan is the capital. Within a portion of country anciently called Mesopotamia, and now generally entitled Turkey in Asia, and lying at the head of the Persian Gulf, between Persia and Arabia, are the rivers Euphrates and Tigris, also the towns of Bagdad and Bassora. It was by these channels, the Persian Gulf, the Euphrates, and also the Red Sea, that a great trade was once carried on betwixt India and the shores of the Mediterranean Sea; now this traffic is at an end, in consequence of the barbarous state of the whole region round about, and the opening of a communication betwixt India and England. Of INDIA, and also CHINA, no account need here be given, as they are fully described in other parts of the present work.

In all parts of Asia, excepting the mid and northern regions, the climate is delightful, and Nature has spread her most bounteous gifts. "'Tis the clime of the East, the land of the sun," but sunk in false religion, superstition, and in a state of moral and intellectual torpor—"all but the spirit of man is divine"—and when or how it is to be rescued from such a condition, no one can foretell. In the southern divisions within the torrid zone, whose genial warmth converts the juices of plants to spices, balsams, sugar, and coffee, with which Asia has enriched the West Indies, the palms (sago, cocoa, date, and umbrella-palms) reach a height of 200 feet, and the white elephant attains a size surpassing that of all other quadrupeds. From hence the silk-worm was brought to Europe. This region conceals in its bosom the most beautiful diamonds, the finest gold, the best tin, &c., whilst the waves flow over the purest pearls and corals. The temperate zone has given to Europe the melon, the vine, the orange, and many of its most agreeable garden fruits, as well as the most productive farinaceous grasses, and the most charming flowers; and unites, in its productions, symmetry with richness, particularly in the western regions. Here the oldest traditions place Paradise; here lie the enchanting Cashmere and the Garden of Damascus; here blossoms the rose of Jericho, near the cedars of Lebanon. The eastern countries in the same latitude possess the tea-shrub and the genuine rhubarb. The camel, the Angora goat, the Thibetan sheep, the pheasant, and the horse, are natives of this zone. In the north blossoms the Alpine *flora* of Dauria, and from the icy soil grows the dwarf-like Siberian cedar, till, at 70°, vegetation mostly ceases. Here live the smallest of quadrupeds—the shrew-mouse of the Yenisey. Sables, ermines, foxes, otters, &c., afford the finest fur. The mineral kingdom furnishes rich ores, rare precious stones, and remarkable fossil remains of the mammoth, in high northern latitudes.

The inhabitants of Asia (amounting to 300,000,000; according to some, to 530,000,000) are divided into three great branches:—The Tartar-Caucasian, in Western Asia, exhibits the finest features of our race in the Circassian form; the Mongolian race is spread through Eastern Asia; the Malay in Southern Asia and the islands. The north is inhabited by the Samoiedes, Tchooktches, and others. Twenty-four tribes, of different language and origin, may be distinguished, some of which are the relics of scattered tribes of Nomades: Kamtschadales, Ostiacs, Samoiedes, Koriacks, Kurilians, Aleutians, Coreans, Mongols, and Kalmucks, Mantchoos (Tungoos, Daurians, and Mantchoos Proper), Finns, Circassians, Georgians, Greeks, Syrians and Armenians, Tartars and Turks, Persians and Afghans, Thibetans, Hindoos, Siamese, Malays, Annamites (in Cochin China and Tonquin), Burmese, Chinese and Japanese, besides the indigenous inhabitants of the East Indian islands, Jews and Europeans. The principal languages are the Arabian, Persian, Armenian, Turkish, Tartar, Hindoo, Malayan, Mongol, Mantchoo, Chinese, and Sanscrit. The principal religions which prevail are Mahommedanism in the western parts, the worship of the Lama of Thibet in the central region, Budhism in the Burmese territory, and Hindooism or Brahminism in India. These and other religions of the Asiatics are described in the artic HISTORY OF FALSE RELIGIONS.

AFRICA.

Africa is a vast peninsula of a triangular form, wi its narrowest point towards the south, containi 12,256,000 square miles; situated between 18° W. a 51° E. lon., and from 34° S. to 37° 30' N. lat.; bound on the north by the Mediterranean, on the east Asia, the Red Sea, and Indian Ocean, and on the sou and west by the Southern and Atlantic Oceans. It h a great breadth from east to west. The northern p tion is much larger than the southern; the great breadth, from west to east, from Cape Negro to Ca Guardafui, is 69°. Under the equator, the breadth 4500 geographical miles. The internal structure Africa is marked by many peculiarities. It posses deserts or arid sandy tracts of immense extent, unin bitable by a settled population, and only traversed troops of wild Arabs, and caravans or companies travellers on the backs of camels. In these awful s tudes, lions, tigers, and other wild animals, hunt fo prey, and dispute possession with the savages w intrude upon their domain. Africa also possesses h mensely long chains of mountains rising to an enorm height. Such are the Atlas mountains, the Mountai of the Moon, and others. The highest peak of the Cam rones is 13,000 feet above the level of the sea. Afri has few rivers suitable for navigation, and hence i impenetrable character. The principal river is t Niger or Joliba, which flows some hundreds of mil from the interior, to the Atlantic on the west coa In this quarter also are the Gambia, the Congo, a the Senegal. The Nile has been the longest and be known; it flows from Abyssinia through Egypt to t Mediterranean.

Excepting in some small spots on the sea-coast inh bited by European colonists, the whole of Africa is the possession of races of men, black and fierce savage, or very slightly civilised, and of a copper co plexion. Of the latter variety are the Moors of t extensive region of Barbary on the north, and also t modern inhabitants of Egypt. Egypt, which is fit else than the valley of the Nile, and lying adjacent Arabia Petræa, and Syria, in Asia, is the only count of Africa in which we can find any interest from hi torical recollections. It is described at length in separate number of the present work. West fro Egypt is Barbary, a country in part nominally subje to Tartary, and containing the districts of Tripoli a Tunis, also Algiers, which has lately been conquer and appropriated by the French. The empire Morocco is likewise in this northern division, in t angle of territory between the Mediterranean a Atlantic. Central Africa comprises a number of sava states, among the rest Guinea on the Atlantic coa Along this coast are certain British, French, Port guese, and Dutch possessions. Southern Africa co prises the countries inhabited by the Hottentots a Caffres, and the Cape of Good Hope, which is at t extreme southern promontory, and now forms a flouris ing British colony.

The islands considered to belong to Africa are t Madeiras, the Canaries, Cape Verd, and Azore islan also St Helena and Ascension, all in the Atlantic; a the large isle of Madagascar, with a few of small size, in the ocean to the east of the continent.

Madeira is the finest and most accessible of t African islands. It extends to about 37 miles in leng by 11 in breadth, and lies at the distance of about fi hundred miles from the coast of Barbary, in the rou of vessels proceeding from Europe to the Cape of Go Hope or India. Lying at about the 31st degree north latitude, it enjoys a delightful climate, suitab for the tender constitution of invalids. Vegetation luxuriant, and the grape grows to great perfection, a yields a fine wine, usually called Madeira. The isla is in possession of Portugal, but many English resi upon it, both for the sake of commerce and health.

The African races of men offer many points of interest to the inquirer. The majority of them are distinguished from the rest of the human family, not only by their black complexion and curly hair, but also by peculiarities in the construction of the bones of the head and even of the nerves. This seems to imply that the negro is originally a distinct race. It is thought that traces of this primitive race may still be detected here and there; for example, of the original Egyptians in the Copts, and of the Guanches (the original inhabitants of the Canaries) in the natives of Barbary. The population is probably between a hundred and a hundred and ten millions. The interior of the country must be very populous, since, within two centuries and a half, it has contributed forty millions of vigorous men to the slave-trade, and, notwithstanding, is any thing but depopulated. Even the countries along the coast are thickly peopled. Jackson computed the population of Morocco alone at seventeen millions, and the Barbary states, with Egypt, which constitute but an eighth part of the continent, contain twenty millions. The torrid Guinea has, on the whole, a numerous population; and large cities are situated on the Joliba, of which we hardly know the names. The inhabitants belong to two branches of the human family; to the black or Ethiopian race, which extends from the Joliba to the southern extremity, comprising, notwithstanding their tawny complexions, the Hottentots; and to the Caucasian race, which includes the natives of Barbary, Copts, the Arabs or Moors, the Agaziones or Abyssinians, and the nations of Nubia. The Arabs are not to be regarded as aborigines of Africa, but they have scattered themselves, and become occupants of the greater part of the north and west.

The prevailing religions are Mahomedanism, and different kinds of Paganism. The arts are exercised only on the northern coasts, where the Moors manufacture much silk, cotton, leather, and linen; an active commerce is carried on by them with the maritime nations of Europe, and, by means of caravans, a traffic, fully as important, with the interior, to which they convey their own products and those of Europe. The wants of the savage races are exceedingly simple, and every article used by them is prepared by themselves; the cloth which surrounds their loins, the hut which protects them from the weather, the bow and arrow necessary for the chase and self-defence, as well as all their household furniture, are manufactured by themselves; the gold which they collect from the surface of the earth is wrought by them into ornaments, and iron into arms. Commerce, however, with Europeans has taught them many wants, and increased their list of necessaries; among which may now be reckoned fire-arms, powder, brandy, tobacco, different kinds of cloth, glass beads, coral, &c.; for which they barter slaves, ivory, gold, and gums, the staples of Africa. The most odious branch of traffic is that carried on in the sale and export of slaves; although in some respect limited in recent times, it is calculated that still 50,000 negroes are carried off annually for the South American market. Of all the states of Africa, Barbary alone uses coin; in the rest not frequented by Europeans, money rarely serves as a medium of exchange; in some, on the western coast, cowries (small shells) are made to answer the purpose of coin; in others, pieces of salt.

AUSTRALASIA,

Which now ranks as one of the great divisions of the earth, consists of a number of large and small islands in the Indian or South Pacific Ocean, between the 10th and 45th degrees of south latitude, in a south-easterly direction from China, which is the nearest part of the Asiatic continent. These islands also lie in a south-easterly direction from India, or Hindostan. The chief island in the group is Australia or New Holland, which measures 2000 miles from east to west, and 1700 in breadth from north to south. The physical character of Australia is very peculiar. With the exception of some mountain ranges, it is generally flat, and in many places the inclination is inwards, instead of outwards, to the sea. There being a general absence of hills, clouds are not attracted over the land, and hence there is a deficiency of rain in the country; the climate is nevertheless one of the finest in the world, and no country on the globe seems so suitable for sheep pasturing. The only native quadrupeds of Australia are pouched animals, such as kangaroos, of which there are several varieties. The native human beings are of the Malay race, and in a low state of barbarism.

Australia now possesses three distinct British settlements—New South Wales, which stretches about 1500 miles along its eastern coast, and some hundreds of miles inland; South Australia, on its southern shore, which has been but recently opened for emigration; and Western Australia, or Swan River Settlement. Van Diemen's Land is another British settlement. New South Wales, which is the oldest and most populous of the Australian colonies, lies at the distance of 16,000 miles from Great Britain, and its capital, Sydney, to which most vessels proceed, is reached in from 100 to 120 days' sailing. Lying on the opposite side from us, its seasons are reversed in relation to ours; its winter is in May, June, and July, and its summer in November, December, and January. Sydney, which is agreeably situated on a fine bay of the sea, called by its discoverers Botany Bay, now possesses a population of 18,000 souls. The whole population of New South Wales, free and convict, is understood to be about 80,000, but the number of inhabitants is rapidly increasing.

South Australia, to which no convicts are allowed to be sent from England, is at present a thriving colony; the town of Adelaide is its capital.

Van Diemen's Land is an island of about the size of England, lying at a short distance south from Australia, and possessing many excellent harbours. Van Diemen's Land is more hilly and better watered than Australia, and therefore better adapted for agriculture. Its capital is Hobart Town, on its southern side. On its northern shore, opposite Australia, is Launceston, the second largest town in the island, and a busy seat of trade. The population of the island was lately estimated at 25,000, about one-half of which were convicts.

The New Zealand islands, which belong to the Australasian group, are situated at a greater distance to the east of Australia.

For a complete description of the whole of these interesting territories, we refer to the articles on the subject in the present work.

AMERICA.

The continent of America lies in the western hemisphere, in a situation altogether aloof from the continents of the Old World—as Europe, Asia, and Africa, are termed. America, or the New World, was first discovered by Columbus in the year 1492, but its coasts were not fully known to Europeans for nearly a century after that period. It was long a matter of doubt whether America was connected at its northern extremity with Asia, and many expeditions were fitted out to discover if such were really the case: it is now ascertained that it is not connected with Asia, but is a detached continent. Although Columbus is entitled to be considered the first discoverer of America, it happened that he was robbed of the honour of giving it his name by the superior address of Americus Vespucius, one of his adventurous successors. America consists of two large portions, very nearly separated by the intervening Gulf of Mexico, and only connected by a neck of land called the Isthmus of Darien. The northern portion is named North America, that in the south, South America. From its northern boundaries to the Gulf of Mexico, North America extends about 4376 miles in length, and 3000 miles wide at the broadest part. South America commences at the ninth degree of north latitude, reaching to the 56th degree south latitude, being a length of 4550 miles, by a breadth at widest of nearly 3000 miles. On this vast double continent, the works of

nature are found on a large scale, calculated to excite our wonder. Mountain ranges, plains, and rivers, are all larger and more magnificent in their proportions and appearance than those in the eastern hemisphere. The soil is also very generally fertile, and covered with the most lofty timber and luxuriant vegetation.

At the period of the discovery of America, it was found to be thinly inhabited by a number of tribes of aboriginal people, generally of a copper colour, and more or less savage in character and habits. The subsequent settlement of colonists from Spain, Portugal, Holland, England, France, and other European nations, had the effect of either extirpating these races, or of driving them westward towards the shores of the Pacific Ocean. They are now comparatively few in number. While they have decreased, the colonists have vastly increased in number by emigration, and the natural increase of population. In a general sense, North America has fallen to the share of British colonists, while South America has become the portion of the Spanish, and other bigoted and bad-managing Europeans. In the course of time, the colonists in nearly all parts have emancipated themselves from the dominion of the mother countries, and set up as independent nations. In doing so, they have embraced the opportunity of trying to establish democratic institutions, with an absence of aristocratic distinction. The greatest of the republics thus established is that of the United States of North America. A third race, the descendants of negroes imported as slaves, is rising into a large amount of population over the whole continent, partly emancipated and still partly as slaves; and being most unfortunately or inhumanely kept as a despised caste, their increasing numbers and condition are at present exciting the attention of the civilised world. It has been computed that the whites and their descendants in all parts of America amount in number to nearly fourteen millions; the Indians to eight millions; the negroes to about seven millions; and the mixed races to at least six millions—making a total of thirty-five millions: but there is yet space and fertile soil for more than five hundred millions.

South America comprises the states or independent republics of Columbia, Guiana, Brazil, Peru, Bolivia, Chili, Buenos Ayres, or the united provinces of La Plata and Patagonia. The principal range of mountains is the Andes, and betwixt these and the Atlantic are many great flat plains, receiving the name of Pampas. The rivers in South America are among the largest in the world; the principal are the Amazon, La Plata, Orinoco, Panama, Paraguay, St Francisco, and Magdalena. The principal islands are the Falkland Islands, Terra del Fuego, off the southernmost point of land, Juan Fernandez, and the Gallapagos.—For a complete account of SOUTH AMERICA, we refer to the number on that subject.

North America comprehends the following political divisions:—On the north, the country of the Esquimaux, who form independent tribes; also Greenland, a large insular or peninsular tract, stretching towards the north pole; next these, to the south, Labrador, a country belonging to Great Britain, and chiefly appropriated by hunters and natives; on the north-east coast the island of Newfoundland, a British possession; Upper and Lower Canada, and Nova Scotia and New Brunswick, also British possessions; thus the larger portion of territory in the northern part of the continent belongs to Great Britain. Adjacent to Canada, and occupying the whole frontage to the Atlantic, are the United States. Behind them, on the west coast, are the states of New Mexico, and in the north-western part a territory claimed by Russia. The extreme southern part of North America, occupying a division of the isthmus of Panama, is the state of Guatemala, which now claims to be independent. Except in Mexico, the larger proportion of the western side of the continent is still in possession of native Indian tribes, but these are quickly disappearing before the advances of civilised man. To this continent belongs a series of islands on the Atlantic side, in the seas between North and South America, now bearing the name of WEST INDIES. Among these are St Domingo, Jamaica, and other islands of importance, chiefly devoted to the culture of the sugar-cane, coffee, and other tropical productions.

North America abounds in fine large rivers, susceptible of navigation for several hundreds, and, in a few instances, thousands of miles. The principal river in the north is the St Lawrence, which issues from a series of large fresh-water lakes, the most extensive on the globe; these are Lakes Superior, Huron, Michigan, Erie, Ontario, and others. They in general divide Canada from the United States. Next in size to the St Lawrence, on the north-east coast, is the Hudson river, which enters the Atlantic at New York. The other chief rivers are the Mississippi, and its tributaries the Ohio and the Missouri. These flow through the central parts of the country, and terminate on the south at the Gulf of Mexico. The valley of the Mississippi is separated from the slopes on the Atlantic, by the Alleghany range of mountains. In the western part of the continent is a similar range, called the Rocky Mountains, which are the boundary adjacent to the slopes on the Pacific. By means of these and other water-courses, personal and commercial intercourse can be carried on to a boundless extent, and with the inexhaustible fertility of the soil, will in time render North America the most populous and wealthy region in the earth. Already, within the period of two hundred years, or more properly since the epoch of the American revolution in 1770–80, the Anglo-Saxon race, originally planted as settlers by Britain, has spread over a large portion of the country, and founded an immense number of towns and cities, and otherwise effected the most extraordinary improvements in all the arts of civilised life. The United States were lately twenty-eight in number, as follow:—Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, all which are known as the New England states; New York, New Jersey, Pennsylvania, Delaware, Columbia, Maryland, Virginia, North Carolina, South Carolina, Georgia, Alabama, Mississippi, Florida, Louisiana, Tenessee, Kentucky, Ohio, Indiana, Illinois, Missouri, Michigan, and Arkansas. The number is constantly increasing, by the acquisition of new territories. The principal cities are Washington the capital, New York, Philadelphia, Boston, Baltimore, and New Orleans.

The principal cities or towns in the British possessions are Toronto, Montreal, Quebec, Halifax, and St John's.

For a complete account of the UNITED STATES, CANADA, and NOVA SCOTIA, we refer to the separate articles on these subjects.

POLYNESIA.

Polynesia—a word signifying "many isles"—is the name now given to the numerous groups of small islands scattered over the Pacific Ocean, but principally lying in an easterly and north-easterly direction from Australia, within about thirty degrees on both sides of the equator. They are perhaps better known under their titles of the Sandwich, Friendly, Society, and Queen Charlotte's Islands, &c. They are many thousands in number, and are inhabited by savage races, who have generally been found much more tractable than the barbarous tribes of the other parts of the world. Most of the islands are fruitful and beautiful; some are exceedingly high and romantic, and their climate is reckoned the most delicious on the globe. Otaheite is one of the principal of the Society Islands. Owhyhee, or Hawai, is the largest of the Sandwich Islands, and measures eighty-four miles in length by seventy in breadth. Here Captain Cook, in 1779, fell a victim to a sudden resentment of the natives, with whom his party unfortunately had a dispute.

NUMBER 4. NEW AND IMPROVED SERIES. PRICE 1½d.

PHYSICAL HISTORY OF MAN.

THE Physical History of Man is a science which proposes to investigate the characters of the different races of the human family, as they exist in different regions of the earth. The great distinctions between the various races must have been marked with wonder at an early period; but no serious effort was made to ascertain the nature and causes of those varieties till the present century, when the subject has been illustrated by the researches of Cuvier, Blumenbach, Prichard, and some other writers. As yet the science is far from having arrived at distinct or satisfactory results; but much of what has been ascertained is nevertheless of a most interesting nature, and well deserving of general attention.

POPULATION OF THE GLOBE—RACES—THEIR GENERAL FEATURES.

Amidst the almost infinite varieties observable in the nations of the earth, naturalists have anxiously sought for well-marked characteristics, which might enable them to class the whole under a few comprehensive appellations. They have arrived at very different results; Malte-Brun, for example, describing sixteen races which he considers as broadly distinguished from each other, while others reduce these to five, and even three. The arrangement now most generally approved, and the one which we design to follow, is that of Blumenbach, which divides mankind into five leading classes or races, each distinguished by such peculiarities in the skin, hair, eyes, and shape of the head, as to stand considerably apart from the rest. They are named the CAUCASIAN, MONGOLIAN, ETHIOPIC, AMERICAN, and MALAY.

1. The CAUCASIAN race is one widely spread on the face of the globe, and, in addition to physical beauty of the highest order, is distinguished for intellectual eminence. The skin of this race may be generally described as fair; but it is susceptible of every tint, and in some nations is almost black. The hair is fine, long, curling, and of various colours. The skull is a large rounded oval, and the brow full and elevated. The face is comparatively small, oval in form, and well proportioned. The nose is arched, the chin full, and the teeth vertical. The chief families of the Caucasian variety are the *Caucasians-proper*, the *Germanic* branch, the *Celtic*, the *Arabian*, the *Libyan*, the *Nilotic*, and the *Hindostanic*.

The race of *Caucasians-proper* are traceable to the confines of the mountainous range of Caucasus, between the Black Sea and the Caspian—a region not far distant from the apparent birthplace of mankind. The Caucasians still dwelling there form at this hour the physical type of this great variety of human beings. The Circassians and Georgians are very perfectly formed, approaching closely in shape and features to the cognate race of Pelasgi or Greeks, who, emanating from this region, spread early over Greece and parts of Italy, and there founded Caucasian nations. At this day a great part of the people of Persia, and especially the upper classes, are of Caucasian descent, the remainder being Mongol Tartars, a race easily distinguishable when pure. The Persian men and women have, generally speaking, fine persons, and they are, like the whole of the pure Caucasian variety, highly imaginative, and fond of music and poetry. The tribes of Affghanistan and Koordistan belong in part to the same variety, and exhibit its wonted physical perfection.

Caucasian Race.

A small body of pure Caucasians founded the Roman nation. The personal differences between them and the Greeks, arose, doubtless, from the extensive admixture of the early Romans with the Sabines and other surrounding tribes.

The *Germanic* family, a great branch of the Caucasian variety, formed one of the mighty waves of population, which, emanating from the original seats of the race, passed over a great part of central and northern Europe, filling Germany and Scandinavia, and partly, also, Russia and Poland. In the latter regions, however, they met with Tartars from Asiatic Scythia, and the mixture of these races produced the Sclavonic subvariety, and originated the Sclavonic tongues. The decline of the Roman power brought out the Germanic tribes from their northern settlements, and, under various names, they formed new locations in the south-west of Europe. Among others, they founded the languages of England, Holland, Denmark, and Sweden, though at different periods. Robust forms, light hair, blue eyes, florid complexions, and large, broad-fronted heads, constitute the chief physical characteristics of the pure Germanic family; while, morally and intellectually, they stand pre-eminent above all the other tribes of mankind. They are conspicuous, in particular, for what may be called the *industrial virtues*, exhibiting a degree of indomitable perseverance in all improving pursuits, which has rendered them the great *inventors* of the human race. The admixture of German and Tartar blood in the north-eastern nations of Europe, has given to these darker hair and complexions than the preceding section, and has also lessened their propen-

sity to intellectual cultivation. The effects of the Tartar conquest of Russia in the twelfth century by Zenghis Khan, whose successors held the country for 200 years, will probably be observable in the career of this people for ages to come, and, indeed, perhaps as long as the race exists.

The *Celtic* branch of the Caucasians formed extensive settlements, at a very early period, in Western Europe. The whole, it may be said, of Italy, Spain, France (called Gallia Celtica), and Britain, was peopled by them. The successive commingling of races, caused by incursions of the Greeks, Romans, and Germans, did much to obliterate the traces of this variety in its pure state; yet the race, language, and name, still remain in their primitive condition on the outskirts of the original Celtic dominions. We allude chiefly to parts of Scotland and Ireland: in Brittany, Gascony, and Biscay, the traces of the people are also distinctly observable. These pure Celts show us what the physical characteristics of their ancestors were. Their frames are athletic, spare, and wiry; their foreheads narrow, and the head itself elongated; the nose and mouth large, and the cheek-bones high; in all, their features are rather harsh. In character, they are hot and fiery, but generous and brave; and they are remarkably patient of fatigue. Intellectually considered, they are acute and ingenious in the highest degree, but are deficient in that breadth and solidity of understanding which distinguishes the Germanic family.

The present population of France partakes largely of the Celtic blood, notwithstanding various invasions of the Germanic tribes, from one of which, the Franks, came the modern name of the country. From the Celts, the French people derive their proverbial vivacity of temper, their quickness of perception, their dashing bravery, and, most probably, their undeniable inconstancy and flightiness of disposition. Britain, again, has retained comparatively slight traces of her early Celtic inhabitants. A branch of the Germans had visited the island even before the invasion of the Romans; and after the latter came Dane, and Saxon, and Norman, in such numbers, that the pure aboriginal stock were left but in the Highlands of Scotland, and partly in Wales. The Scottish Lowlands had early been colonised by the Picts, a people, there is every reason to think, of Germanic origin; and subsequent intermixtures with the southern inhabitants of the island speedily gave the population still more of the Germanic character. In this manner was formed the root of the existing British nation, one of the most remarkable on the face of the earth. Inferior to no one of the Caucasian families in intellectual endowments, and possessed of indomitable courage and unbounded enterprise, it has scattered its colonies over a large portion of the globe, giving to new regions its language, its genius, and its arts. Above all, it has given origin to the great Anglo-American nation—a nation, if inferior at all, inferior only to the parent stock, in those attributes that ennoble the race. Much of the excellence that belongs to the British character, certainly arose from the preponderating infusion of Germanic blood, resulting from the incursions of the Norsemen upon the aboriginal Celts. But the sprinkling left of Celtic blood seems to have had its use also, in giving a share of vivacity to the comparatively heavy, massive temperament of the pure Germans. We may judge so from looking at the character of the unmixed Germanic families. The Dutch, for example, would evidently have been an improved race had their specific gravity of character been lightened by a little infusion of Celtic mercurialism. The Belgians have a pretty equal share of Celtic and Germanic blood in their veins; and consequently, while they display the industrial virtues of the latter race, they also show no slight admixture of Celtic flightiness.

There may appear some fancifulness in this mode of analysis, but we believe that an accurate examination of the proportions in which the Germanic and Celtic blood are mingled in all the countries of Europe, would fully bear out the views now taken. In Italy, Spain, and Portugal, infusions of Germanic blood took place, but to a comparatively slight extent. The aboriginal Celts of Spain were extensively mingled with Roman immigrants; and it may be said that, at this day, Romanised Celts, with a sprinkling of Gothic (Germanic) and Saracenic blood in their veins, form the existing population. In them, the faults of the Roman character, as well as its haughty virtues, are even yet distinctly traceable. Romanised Celts constitute the basis also of the Portuguese and Italian nations, and the preceding remark applies to their character as much as to that of the Spaniards. The languages of the three countries bear out these observations.

The subject of the Germanic and Celtic branches of the Caucasian variety of mankind, as well as of the Caucasians-proper, has been treated of at some length, because these tribes have been the great civilisers of the world. The *Egyptian* or *Nilotic* branch forms almost the only exception to this statement. Most of the existing nations of Europe can distinctly trace their origin to these Caucasian tribes. Dr Prichard traces a chain of connexion between the roots of the Sanscrit, Greek, Latin, and German languages, which leads him to imagine them to have all sprung from a common original. A remarkable similarity has been traced between the Celtic and Phœnician languages. These and other circumstances, to a certain extent, point to a common origin and place of origin; but the affiliation of nations, as Humboldt justly observes, cannot be distinctly made out in this way. Conquests and colonisations must confuse all such attempts.

After treating of the three great influxes of population which founded the past and existing nations of the European continent, the *Arabian* and *Libyan* branches of the Caucasian family fall to be noticed. Spare but active persons, skins of a light brown, allowed sometimes by unusual exposure, high foreheads, large dark eyes, oval features, with aquiline noses and small thin-lipped mouths, form the personal characteristics of the Arabs. They have occupied the confines of the present Arabia from time immemorial, and their natural habits have ever been pastoral and migratory. The Bedouin Arabs claim descent from Ishmael, and, however this may be, it is plain, from physical characteristics alone, that they are a cognate race with the Jews. The latter were originally derived from the Chaldeans, an elder branch of the Arab race settled in Babylonia, and they were a pastoral and wandering people like their congeners, until they settled in the cities of Palestine. A body of Canaanite Arabs, expelled by the Jews under Joshua, are understood to have settled in Africa, and become the nation of the Mauri or Moors. Governed by Mahomet and his successors, the Arab race rose to high consequence, and, under the name of Saracens, made great conquests of territory in Asia Minor, Africa, and in Spain. They were afterwards deprived of superiority in some of these countries, but left extensive tribes in the African continent and Asia Minor. The Berbers (or *Libyans*) are a race who seem of Arab descent, but who probably settled in Africa at a far distant date. They resemble the Arabs in person, but are more darkened in complexion. Under the name of Tuariks, they range both to the north and south of Mount Atlas. They are wilder in habits than the Arabs, but may be spoken of as the same race, and with the same capabilities. They form a large part of the existing population of the north of Africa, occupying, with the Arabs, nearly the whole of the Mediterranean shores of the continent, from the Straits of Gibraltar to Egypt; and, either under the name of Moors, of Arabs, of Tuariks, or of Felatahs, they are rapidly insinuating themselves within the tropics, obtaining every where that superiority over the Negro race, which the Caucasian family seldom fail to acquire wherever they plant the foot. It seems more than probable that the Arab race will ultimately push the Negroes from Africa; and indeed may annihilate them, as the European whites have done, or are doing, in the case of the Red Indians of America.

…e latter remains but a few centuries have been …sary to accomplish the change of populations, and …as the African continent is, many centuries may …ass away ere it rest entirely in the hands of the …ative race." The Negroes have indeed lost more …half of it already, for there can be little doubt …they once stretched to the Mediterranean. Hence …ar at first shrinks from the idea of a consummation …this; but reflection soon reconciles us to it. The …anting of one race by another does not imply the …ere destruction of individuals which it at first ap…s to do. It only, in the main, denotes a stronger …ess of population in the one race than the other; …development of numbers in the one is repressed, …other encouraged, till at length the first may be …by the other, leaving the intruding race in posses…of the soil. Generally, where such changes take …, the soil becomes the means of supporting far …re numbers than formerly.

…e Wahabees in modern times, and in past days the …ites and Idumeans, whose respective capitals …Tyre and Petra, are further specimens of Arab …. The last two tribes sprang, it is probable, from …primitive Canaanan branch, settled at Babel or …. Whatever be its ultimate destiny, we may an…ate that the Arab race will yet play a greater part …affairs of earthly affairs than it has hitherto done. …capacity of the race is high, and under favourable …umstances, as when settled in the cities of Spain, …quisitive talents for poetry, music, and the fine arts, …played themselves in no ordinary degree. Planted …ng on the fertile banks of the Niger, of which …are rapidly assuming the mastery, they might in …course there all the splendours of the Caliphate.

…e Nilotic (Coptic or Egyptian) branch of the Cau…n family, is chiefly remarkable on account of its …distinction in past times, when the tribe founded …ivilisation of the world. The Nilotic branch con…s of the Egyptians, Nubians, and Abyssinians; and, …ough these nations have long been commingled with …Arabs, producing the mixed race of Fellahs, yet …pure Nilotic characteristics can still be traced …g them. Slender persons, long limbs, and delicate …; narrow oblong foreheads, eyes elongated in a pe…r manner, long noses, with swarthy brown com…ions, seem to have been the main personal features …the old Egyptians. The pure Copts now-a-days ex…various shades of colour, from a pale olive to a …brown. The flat features and bushy hair of the …s led the traveller Volney to form the hypothesis …the old Egyptians were Negroes; but his desire to …at a liberal conclusion carried him too far. The …rous paintings since discovered, in many of …h Negroes appear as captives, exhibiting features …rly distinct from those of their Egyptian captors, …demonstrably that the Nilotic race were of the …asian variety of mankind. Even at this day, the …ans, certainly the purest descendants, as a nation, …the old Egyptians, have in no case the woolly hair, …features, or long heels of the Negro race, though …often nearly jet black in complexion. They have …Caucasian heads and forms most undeniably. At …time the banks of the Nile, from the Abyssinian …ains to the seven-streamed Delta, were peopled …e Nilotic race, it would be vain to conjecture. It …y in the case of countries far more distant from …radle of the race, that we can form any rational …ctures upon the date of immigration. It is scarcely …ecessary to add, that history proves the Copts once to …have possessed the highest intellectual capabilities.

The *Hindostanic* branch of the Caucasians presents an extraordinary variety of complexions, from a dark pale black to a beautiful brunette. Shades of olive, however, are the predominant hues. Small, elongated, and narrow heads, oval faces, noses slightly aquiline, bright black eyes, and dark glossy hair, with very short slender persons, mark the pure Hindoo race. Passing by the claims which they themselves prefer to immense antiquity, there can be no doubt that they have been longer settled as a nation than almost any on the earth. They early attained to distinction in the sciences, and particularly in mathematics, poetry, and the drama. What was the precise place of their origin has been long a matter of dispute. From the great reverence borne by them for the north, and from the unquestionable intercourse existing between them and the Egyptians in the very earliest times, as well as from the numerous points of similarity between the two nations in many important respects, a common and intermediate spot might be regarded as likely to have produced both. But conjecture on this point would be fruitless.

We have now gone over the various prominent branches of the great Caucasian family. To them we owe nearly all that dignifies the name, and enhances the happiness of the human being. All that we possess of written literature—from the poetic, historical, and philosophic treasures of Greece and Rome, and the romantic creations of Arabian fancy, to the professions of the modern press—has emanated from the Caucasian variety of mankind. The Pelasgian branch in ancient times, and the Teutonic or Germanic in modern ages, have been most distinguished for their institutions, and the various gradations of the higher intellectual powers.

The Germans, in an early age of their history, were the first who raised WOMAN from the condition of a slave to that of an equal with man, and made her a partner in his powers and rights. The importance of this change is best shown by the fact, that, to woman's condition among them at this hour, the Mongols and other varieties of men certainly owe much of their inferiority. Free political institutions, elective senates, and jury trials, came from the Germanic race. They were the discoverers of printing, of the compass, of the steam-engine, of gunpowder (a great invention, however abused), and of accurate time-measurers. To these discoveries numerous others might be added; but when we think how much the happiness of man now depends even on these few, we feel it unnecessary to extend the list. The Caucasians-proper, and the Celtic family, have shown surprising genius in many departments of intellectual exertion, but, in all the industrial arts that bear practically on human comfort, they must yield the palm of merit to the Germanic family.

2. The MONGOLIAN variety, as regards numbers, is a family of vast importance; the tribes of the Mongol-Tartars, the Turks, the Chinese, the Indo-Chinese, and the Polar races, being included in it. These tribes cover an immense portion of Asia, from the line of the Ural and Himmaleh mountains to Behring's Straits; and they are spread over more than one-half of North America, towards the Arctic Circle. They also occupy Greenland and a portion of the north of Europe, comprising the Finland and Lapland coasts.

Mongolian Race.

The physical characters of the Mongolian race vary considerably, but the following general description will be found to apply extensively. The skin is commonly of a sallow or olive tint, and in some cases nearly yellow; the *hair is black*, long, and straight, seldom curling;

…e Arabs are likely to be dislodged in turn by a more culti… people. While they are pushing themselves into power amid …ons of the interior, a Caucasian race, of higher civilisa… has set its foot on the Mediterranean shores of Africa, and …to push them out of their previous conquests. We refer …occupation of the Algerine coast by the French. Strange …mously the round of substitutions seems to go on! From …mense extent to which they are spreading, one would say …e Caucasians were destined to fill the earth. Certain it is, …y appear to have peculiar *capabilities for successful*

the beard usually scanty; the iris black; the nose is broad and short, and the cheek-bones broad and flat, with salient zygomatic arches; the skull is oblong, but flattened at the sides, so as to give an appearance of squareness; and the forehead is low. In intellectual character, the Mongolians are by no means defective, but they are more distinguished for imitative than inventive genius. This faculty at the same time renders them highly susceptible of cultivation. In many cases, however, tribes of this variety have arrived at considerable proficiency in literature and the arts. Their moral character is decidedly low. China, Japan, Thibet, Boutan, and Indo-China, may be mentioned as locations where the best-marked specimens of the Mongolian variety are to be observed. The Turkish and Mongol Tartar tribes have been great conquerors in past times, and have often even vanquished the Caucasians; but, in most cases, they have afterwards been repelled from their acquisitions by the Caucasians, succumbing to the apparent law of nature which gives these the ultimate superiority in all struggles with the other varieties of men. The Fins and Laplanders appear to be a remnant of some primitive Mongolian people, whom the Caucasians originally pushed to the extreme verge of the Arctic seas, and were content to leave there. The Esquimaux, as well as the people of Finland and Lapland, have some physical peculiarities distinguishing them from other Mongolians, but these seem to be the effect chiefly of local position, which undoubtedly exercises a *degree* of influence on the human frame.

3. The ETHIOPIC or BLACK variety of mankind are characterised by complexions of jetty hue, black woolly hair, eyes large and prominent, nose broad and flat, thick lips, and wide mouth; the head is long and narrow, the forehead low, the cheek-bones prominent, the jaws projecting, and the chin small. A long protruded heel, also, and a flat shin-bone, often distinguish this variety. The principal Ethiopic families are the Negroes of central Africa, the Caffres, the Hottentots, the natives of Australia, and some of the islanders of the Indian Archipelago and the Pacific Ocean. The lands over which this variety is spread (numbers being left out of the question), are proportionally of somewhat smaller extent than those occupied by any of the other varieties of mankind, with the exception of the Malays. The Mongolians, to be more explicit, occupy the largest share of the globe; the Caucasians (their various colonial settlements being included) stand second in this respect; the Americans occupy a portion slightly less than that of the Caucasians; the Ethiopic variety stands next in the list; and the Malays are lowest of all in the scale. The following figures will further show the proportions of these territorial holdings in a rough manner:—Mongolians, 4; Caucasians, 3; the Americans, 2¼; the Ethiopians, 2; and the Malays, 0·1-20th. The chief locations of the Ethiopic race are—Africa south of the desert of Sahara; New Holland; New Guinea; New Georgia; and a few other Polynesian islands. Most island Negroes are of a dingy brown hue. In disposition, this variety of mankind are easy, indolent, and cheerful; in intellect, the race varies much, though certainly the majority of its tribes stand low in this respect. This may be in part ascribed to want of cultivation, and opportunities for cultivation; but even while adopting this lenient view of the matter, it is impossible to shut our eyes to the fact, that the race have shown no inventive genius. They would otherwise have long ago originated the arts of civilisation for themselves, as other varieties of men certainly did. At the same time, many of the Negro r shown no mean degree of talent, and some have exhibited such address in the arts of pol war, as indicated the capability of attaining t state of intellectual advancement, had their pow properly fostered and directed.

Ethiopic or Black Race.

American Race.

4. The AMERICAN variety of mankind occu defined territorial limits. They were originall over nearly the whole of the Americas, sout sixtieth degree of north latitude, though their are now thinned, and their territorial possessi tailed, by the colonial incursions of the Cauca reddish brown complexion, long black lank ficient beard, eyes black and deep set, recedi (sometimes from artificial compression), hig bones, prominent aquiline nose, small skull, apex high and the back part flat, large m tumid lips, with fine symmetrical frames o height, form the chief physical characteristic race. "In their mental character," says Morton, by whom they have been thoroughly "the Americans are averse to cultivation, an acquiring knowledge; restless, revengeful, fon and wholly destitute of maritime adventure." writer divides the Americans into two great cla of which (Toltecans) embraces certain semi nations, as the Mexicans, Peruvians, and while the other includes all the hunting tribes America, the Brazilians, the Patagonians, the and other minor tribes, none of whom have the same capacities for cultivation as the fi tioned nations. The Americans differ much of skin and stature. Some of them are not b of a perfect copper tint. The Patagonians a most gigantic size, while the Fuegians are v in stature. Yet there are characters comm which have led accurate inquirers to set th as being throughout one and the same peopl languages have certain peculiarities found universal occurrence among them, from Ca to the far north. By those who, like Cuvier, viewed the Americans as an indigenous race, in which the New World was peopled has b ously inquired into, and it has been conjectu they either came by Behring's Straits from that some small party, in ages long past, wa accidentally across the seas to these vast shore an occurrence as the latter has been proved impossible, to say the least of it. But assu weight of evidence is in favour of the opinion Americans are, not a casual offshoot from so human family, but a people so far indigenous, and primitive, as to be derived from a comm endowed with specific and unique physical ch The manner in which they were planted in stined home, and received these peculiar ch fitting them for its inhabitation, must remain ing to this view of things, among the mysteri the Creator has seen fit to leave in darkness. deniable, it may be observed in conclusion, American race is tending to extinction.

Malay Race.

5. The MALAY variety of mankind are characterised by tawny or dark brown skins, coarse black hair, large mouth, short broad noses, seeming as if broken at the root, flat expanded faces, with projecting upper jaws, and salient teeth. The skull in this race is high, and squared or rounded, and the forehead low and broad. The moral character of the Malays, generally speaking, is of an inferior order. They are a race differing much, in some respects, from the Negro and Red Indian, being of peculiarly active temperaments, and fond of maritime enterprise. They exhibit considerable intellectual capacity, and are an ingenious people. Borneo, Java, Sumatra, the Phillipine Islands, New Zealand, part of Madagascar, and various Polynesian islands, are inhabited by this variety of men. It is extremely probable, from the fact of their being found in islands surrounded by others in the hands of the Ethiopic race, that the Malays have pushed out the less active variety from these isles, and, in short, annihilated them. It is but too likely, moreover, that the Malays will in turn suffer extinction at the hands of a superior variety, or a variety rendered superior by civilisation, if not naturally so. Safely, indeed, may one prophesy that, in New Zealand, ere many years pass away, the natives will have disappeared before the European colonists. Not many months ago, the last native thus disappeared fron Van Diemen's Land. So will it be ere long with New Holland, large as that continent is. Amalgamation of races is in these cases next to impossible, and no other preventive, as already stated, could be found.

DISTRIBUTION OF THE RACES—CHANGES AND AMALGAMATIONS.

This point, really one of the most curious and important connected with man's physical history, may be illustrated by further references to the changes in geographical position, undergone by the five great varieties of mankind now described, from the earliest periods. Very few portions of the earth have retained the inhabitants by whom they are known to have been first peopled. With respect to Europe, it seems extremely probable, as Dr Prichard and others admit, that the Celtic and Germanic races were not the earliest settlers upon its territory. They pushed out, from some parts at least, a previous race, of which the Fins and Laplanders may perhaps be held to give us some idea. The Celtic population of the south of Europe were in a great measure overwhelmed by the Germanic tide from the north, and, though centuries of confusion followed the collision, the good ultimately effected by the intermixture was immense. It appeared, indeed, as if a savage people there crushed a civilised one, but the result, in reality, consisted in the infusion of healthy blood into a vitiated frame. At this day there is but one important part of Europe in the hands of the pure Mongolian race, namely Turkey. But can we doubt that at this very hour the once formidable power of the Ottomans is verging to extinction? The Caucasian states around it have gradually seized province after province, and jealousy of each other alone prevents them from at this moment annihilating the petty remnant of the Mongols left in Europe. The power of the empire is not only going to decay, but, as M. Lamartine has lately shown, the Turks are in reality becoming extinct as a people. They are sinking beneath the pressure of the superior or superiorly cultivated nations around them.

In Africa, as has been said, the Negroes have already been stripped of one-half of their continent by the Caucasian Arabs, and are likely to be ultimately extinguished by them. If the climate of the same great country had been more favourable to the pure Caucasian whites than it is, they would assuredly have taken a larger share in the occupation of it than they have done. As the case stands, their aggressions have been considerable. Not to speak of their coast stations, they have colonised the southern extremity of Africa, and the Caffres and Hottentots are falling before them, or are receding to the interior, to be finally crushed between the opposing forces of the Arabs and Europeans. The Arabs themselves are beginning to feel the retributive pressure of the French on the Mediterranean coast. In Egypt, again, we may trace striking proofs of the same grand movement. Altogether, what with the Arabs and the whites of Europe, Africa may be expected, ere many ages pass, to be in the hands of the Caucasians.

In Asia, the conquering Mongols long held extensive rule, but the semi-Caucasian power of Russia in the north, and the British in the south, have torn from them immense territories, and every few years behold additional losses on their part. Even at this time the great Mongol power of China, which, by a policy cautious to an extraordinary degree, maintained for ages its independence, has forgot itself so far as to provoke a struggle not likely to terminate until China becomes little else than a Caucasian colony. The Australian continent, and the Polynesian islands, are also on the direct way to the same consummation.

The truth of the view now taken is more remarkably borne out by the history of the Transatlantic Continent, than by that of any other country. Rapidly, indeed, have the red men of North America fallen before the march of Caucasian colonisation. The numerous islands of the Mexican Gulf have been so completely cleared of all traces of native population, that it has become a matter of doubt whether, on several of these islands, any native population ever existed. South America has been largely subjected to the same influences, and would have suffered more from them, had the Caucasians who went thither been a branch specially adapted for the business of colonists, and had not a considerable admixture of races peculiarised that colonisation. As it is, the natives have been thinned, though the amalgamation alluded to, arising from the *comparative* similarity between the races, renders the truth difficult of discovery. In short, if we look at the whole course of the past history of mankind, we shall find the Caucasian race every where gaining the ascendancy, and slowly but surely renovating the population of the world.

In those instances where an amalgamation of varieties of men has taken place to a considerable extent (and there are a few prominent cases of the kind to be observed at present on the face of the globe), a population of a most extraordinary and heterogeneous kind has been the result. In parts of South America and Mexico, not only Europeans and native Americans, but also Negroes and Malays, transported thither chiefly as slaves, have contributed to form the existing population. Europeans and Negroes produce a race called Mulattoes; the children of Europeans and native Indians are termed Mestizoes; and those of Negroes and Indians are styled Zamboes. Of course, the subvarieties are numerous—indeed, almost numberless. The European and the Mulatto produce Tercerons; the children of the Terceron and the European are called Quarterons or Quadroons; and those of Quadroons and Europeans are Quinterons. In the Quadroon, little or no vestige of dark blood is visible; but in most countries where these admixtures take place, the rights of pure white blood are only assigned to the Quinteron. Mexico, and the greater part of the states of the South American continent, including Peru, Chili, and Brazil, with the colonies and islands of the West Indies, are the chief scenes of these amalgamations of blood. Undoubtedly their immediate consequences are pernicious. The white blood is every where haughtily disposed towards the dark, and all the jealousies and oppressions of *caste* are accordingly displayed to a dread-

ful extent. Whether, out of the numerous varieties and sub-varieties of species there at present to be beheld, *one* perfect and homogeneous race shall ever be formed, is rendered doubtful by the undiminished, if not increased, eagerness with which the purity of the white blood continues to be maintained. If we could suppose that the amalgamations of different varieties of mankind were never to produce happier consequences than in these instances, we might question whether such admixtures be desirable. The experiments of amalgamation and non-amalgamation may be said to have been tried, on great scales, in the two American continents, and it is of importance to notice the issue in the respective cases. In North America, we must ere long find the aborigines extinct; and in the place of hordes of savages, stationarily pursuing the wild and warring life led by their fathers from time immemorial, will be found a great and improving race, cultivating the arts of peace, carrying human civilisation to the highest pitch, and extracting from their vast continent all the blessings with which the Creator has so liberally endowed it, and which he certainly meant not to lie unused.

The general characters of the great varieties or families of men, the mode of their distribution over the earth, and the causes which have affected, and are likely hereafter to affect, their future fate, have now occupied our attention; and our next duty is to advert to the most remarkable features of difference in the various branches of the human family.

VARIETIES OF SKIN IN MANKIND.

It has been already seen, that the Caucasians are generally distinguished by a white or fair skin, while the Mongolians are yellow, the Ethiopians black, and the Americans red or copper-coloured.

In former times, when only two varieties, the white and black, were recognised or thought of, it was supposed that complexion was simply a result of the action of the sun's rays. This idea would naturally arise from its being observed that exposure to the sun darkened a white person, while seclusion tended to bleach or whiten him; and that the black nations were those which chiefly occupied tropical countries, while the whites were placed in the temperate zone. The Greeks, who never doubted that they were the perfection and standard of human nature, and who entertained exaggerated notions of the heat of the African sun, were strongly impressed with the idea that the Negro nations had been originally white, and had been changed into black purely by the action of the solar rays. This notion continued to be set forward undoubtingly by naturalists down to the time of Buffon, and it is still the belief of the ignorant in most countries.

The views of naturalists on this subject have recently been considerably affected by the investigations of M. Flourens concerning the actual structure of the coloured skin.* The white, as is well known, has a skin composed of three integuments. First, is the outer or *scarf-skin*, a thin transparent pellicle, seemingly secreted by the parts below, and devoid of recognisable vessels or nerves. Next below, is the *rete mucosum*, a soft, pulpy net-work. Next, or undermost, is the *cutis* or true skin, a strong layer, abundantly vascular, and very sensible. It was formerly supposed that the colouring matter of the dark races lay in the *rete mucosum*, and that the only difference between the two races in that respect lay in the one having a mucous integument charged with globules of colouring matter, and the other a mucous integument in which there were no such globules. If the investigations of Flourens be correct, the difference is considerably greater. He states that, in a sufficient variety of experiments he has found the skins of Negroes and red Americans, he has beneath the *rete mucosum*, two distinct additional layers, capable of being detached, and the outer of which is the true seat of the colour of those M. Flourens considers this as a difference much important than any depending on form. Being a tural difference, he thinks it should be held as the first class, while differences of shape ought o be considered as secondary. Without following h these speculations, we may readily allow the in ance of a peculiarity which consists in a distinc additional *part*. M. Flourens, it may be rema has found the two layers also in Mulattoes. H not had an opportunity of experimenting upon M lians or Malayans; but he infers, from the other that in them also the extra integuments wou found.

M. Flourens adds, that, in the case of Eur tinged by exposure to the sun's rays, the mucou is what is affected, becoming, as it were, slightly No degree of exposure can, he thinks, conte colouring layers of the Negro and other dark He remarks, that the African Moors, who have beside the Negroes for centuries, have never ac the colouring apparatus of that race; and it ha observed by travellers (Captain Lyon among o that the Tuariks, a race of African Caucasians dark-brown complexion, are nearly as white on parts of their bodies covered up from the sun, a Europeans. It is also well known that the prog an European, however much he may have been by the sun, is invariably as white as he himself first.

The black races are localised in the warmest r of the globe, and their skin and general const seem to be fitted for their allotment. A black ma lie naked, exposed to the hottest sun, without i while the skin of the white man, if exposed to s heat, breaks out in blisters. The black man can under a burning sun with impunity; but the whit sinks under exertion made in such circumstance this is well known to be the cause why slaves w troduced from Africa into the settlements of peans in tropical America. Sir Everard Hom made some laborious investigations into this s was puzzled by the obvious physical fact that th skin must absorb more heat than the white. Bu since been suggested by Dr John Davy that th perspires most readily. "In the Negro," he say blood flows more readily through the vessels, s promote perspiration, and by that means contri to the cooling of the surface, it contributes again it flows back to the heart, to the cooling of the i parts." After quoting this remark, Dr Glover o castle says—"Were the inhabitant of the tro possessed of this organisation, his system could spond to the stimulus of heat, by a determina fluid to the surface of the body; and the heat ab by the skin being prevented from entering the by the perspiratory process, the greater *radiating* of a dark skin must be beneficial in cooling. the dark skin places the Negro in the conditions climate, by causing him to radiate heat at nig become at that time cooler than a white under th circumstances." Hence the love of the Negr night dancing and exercise.

M. Flourens deems the difference of structu tween the white and coloured races as sufficie prove that they are of different stocks, and he s ingly speaks of them as "essentially distinct But there are some considerations which great found all such conclusions, as drawn from diffe of colour alone. Colours, it is to be observed, invariable characteristics of particular races. Caucasians, it is true, are white; but then the also black Caucasians. The Hindoos are und Caucasians, being proved to be so by many cha of form. Yet the Bengalese and Malabars, v of the Hindoos, are often as black as the gener Negroes. Caucasians of similar colour are through Persia and Western Asia, into Northern It has indeed been said that the Hindoo branch

The Natural History of Man. By M. Flourens. Edinburgh Philosophical Journal, July 1826.

Caucasians alone includes every variety of colour, from the deepest black to something very nearly white. There are similar variations in at least one of the other four races. "Although the Americans," says Dr Morton, "possess a pervading and characteristic complexion [which he describes as more brown or cinnamon-coloured than red], there are occasional and very remarkable deviations, including all the tints from *a decided white to an unequivocally black skin.*" The white tribes have been found chiefly in the high regions in the northern part of South America. With such facts before us, we cannot admit that the colouring apparatus of M. Flourens decides that the races are distinct.

DIFFERENCES IN HAIR AND EYES.

Dr Prichard has endeavoured to class mankind, with a regard to the colour of their hair, into three varieties, the *Melanic*, the *Xanthous*, and the *Albino*. The Melanic, or black class, comprises all individuals or races who have black hair; the Xanthous includes all who have brown, auburn, or red hair; and the Albino all who are distinguished by white hair and red eyes. With all due deference for the able writer who proposed this arrangement, it seems one from which no distinct or useful conclusions are deducible. The hair, however, is certainly a strong individual characteristic in man. Its colouring principle is evidently the same, speaking comprehensively, with that of the skin. The hairs issue from bulbs or roots beneath the true skin, where vessels supply them with nourishment. An external horny covering, and an internal pith, constitute the body of each hair, and the pith is to some extent vascular, because liable to disease. It is, doubtless, in this vascular pith that the colouring principle lies. The fact of the pith being supplied both with vessels and nerves, is further proved by the effect which great grief can produce upon the colour of the hair. Dr Prichard had personally observed one case in which the hair grew white in a single night through grief, and many similar cases are on record. One distinguished French anatomist went so far as to assert, that in the bulbs of the hair lay the whole colouring matter of the skin; but, admitting that minute hairs exist on the general frame, we could not thus explain the black hue of the inside of the Negro's lip, which is quite free from hair. However, when we consider that the woolly hair seems to be inseparable from the jetty skin of the Negro, and the lank straight hair from the red skin of the Indian, we must believe in the existence of some strong bond between these physical characteristics.

In like manner do we trace a general correspondence between the colour of the eye and the skin and hair. The hue of the eye depends on a pigment or dye, lining the choroid coat or membrane. According to the tint of this pigment, is the eye blue, grey, brown, hazel, or black. Generally speaking, light-coloured eyes are conjoined with fair complexion and light hair, and the converse holds as commonly good. To this rule, it is well known, there are exceptions; yet Mongols, Ethiopians, Malays, and Americans, in ninety-nine cases in the hundred, show the extent of its applicability. The Caucasians display, in this respect, greater variations.

The Albinoes are scarcely to be called a variety of mankind, being a race whose peculiarities depend on *defects*. Red eyes and white hair are their chief features, though these features vary a little according to the race to which the individual belongs; and there are Albinoes to be found in almost all countries. The redness of the eye depends on the absence of pigment on the choroid coat, permitting the red blood-vessels to be seen. From a deficiency in the power of absorbing the rays of light, which purpose is served by the pigment, the eyes of Albinoes are weak. The Albinoes of the black race are called white Negroes, from the colour of their skin, and they have white woolly hair. Among the copper-coloured natives of the Darien isthmus, Albinoes are common. Their bodies are of a milk-white tint, covered with a short down; and they have white hair, with red eyes. They love such light as the moon gives, and by night are all life and activity, while by day they are miserable, the rays of the sun making their weak eyes stream with water. It is needless to dwell on this subject, however, as the Albino peculiarities are, in the main, much the same every where. Europeans of this description are sometimes exhibited in public. The connexion between skin, hair, and eyes, and the unity of the source of colour for all these parts, is very strikingly exemplified by the peculiarities of the Albino race.

SKULLS OF MANKIND.

Amongst the external distinctions of races, the form of the skull calls for particular attention. In describing these varieties, the shape of the skull of each was noticed in a general manner, and it would be observed that great differences existed with respect to this feature. From observation of an immense number of heads, Blumenbach arranged the skulls of men into three great divisions, the Caucasian, Mongolian, and Ethiopic, holding these to stand at extremes from one another. The skulls of the American and Malay seemed to him to stand intermediately between these. As, beyond all doubt (without carrying our belief to extremes, as some have perhaps done), we ought to consider the form of the skull as indicative of the intellectual powers, the distinctions in this organ necessarily become of great importance. The most perfect type of the Caucasian skull is found, as might be anticipated, in the modern Caucasians-proper, such as the Georgians. "The head [of a female Georgian, described by Blumenbach] is of the most symmetrical shape, almost round; the forehead of moderate extent; the cheek-bones rather narrow, without any projection, but having a direction downwards, from the malar process of the frontal bone; the alveolar edge well rounded; the front teeth of each jaw placed perpendicularly."

The head of the perfect Mongolian type is, says Blumenbach, "almost square; the cheek-bones projecting outwards; the nose flat; the nasal bones, and the space between the eyebrows, nearly on the same horizontal plane with the cheek-bones; the superciliary arches scarcely to be perceived; the nostrils narrow; the maxillary pit slightly marked; the alveolar edge in some degree rounded forwards; the chin slightly prominent."

In the Ethiopic variety of men, "the head is narrow, and compressed at the sides; the forehead very convex, vaulted; the cheek-bones projecting *forwards;* the nostrils wide; the maxillary pits deeply marked at points; the jaws lengthened; the alveolar edge narrow, long, and elliptical; the front teeth of the upper jaw turned obliquely forwards; the lower jaw strong and large."

In the American skull there is an approach in shape to that of the Mongol, with this difference, that the top is more rounded, and the sides less angular. The summit of the Malay head is narrowed, the forehead a little arched, and the upper jaw pushed somewhat forward. It would be superfluous to enumerate here the particular tribes marked by these varieties of skulls, as this has been done with sufficient distinctness in the general classification of the races. Of course, among Caucasians, Mongols, and Negroes, there are considerable individual differences in the form of the head, but the preceding descriptions give the type of each division.

No mode of examination exhibits so strikingly the differences in shape between the skulls of different races, as that called by Blumenbach the *vertical* method, in which the various skulls are placed in a row, resting upon the lower jaws, and are then viewed from above and behind. Examined from above, the facial bones of the Caucasian skull are scarcely visible, both from their comparative smallness of size, and because they are hidden by the rounded and well-developed forehead. A perpendicular line, falling from the middle of the br[illegible], would barely touch the front of the upper jaw.

Negro head, in the same position, presents a strong contrast to the preceding one. The narrow slanting forehead here permits the *whole face* to come into view, the cheeks and jaws being somewhat compressed laterally, and greatly elongated in front. In the case of the Mongol, again, we find a contrast not less remarkable. The bones of the nose, cheeks, and jaws, are almost equally visible as in the Negro, but are expanded on each side, not pushed angularly forward. The squareness of the Mongol head arises in a great degree from this lateral expansion of the facial bones. Dr Prichard gives to these varieties of the skull the respective names of *mesobregmate*, *stenobregmate*, and *platybregmate*—words expressive of the characters which have here been assigned to them.

This remarkable contrast in the prominency of the facial bones, conjoined, as it commonly is, with an equally striking difference in the anterior development of the skull, has been deemed by some physiologists a feature of the highest importance. Camper founded on these physical characters a scheme for estimating the degrees of intellect and sagacity bestowed by nature on the whole members of the animal kingdom possessing a skull and brain. The *facial angle*, as he termed the degree of prominency in the facial bones, was measured by him in the following way. One straight line was drawn from the ear to the base of the nose, and another from the prominent centre of the forehead to the most advancing part of the upper jaw-bone, the head being viewed in profile. "In the angle produced by these two lines," says the physiologist, "may be said to consist, not only the distinction between the skulls of the several species of animals, but also those which are found to exist between different nations; and it might be concluded that nature has availed herself, at the same time, of this angle, to mark out the diversities of the animal kingdom, and to establish a sort of scale from the inferior tribes up to the most beautiful forms which are found in the human species. Thus it will be found that the heads of birds display the smallest angle, and that it always becomes of greater extent in proportion as the animal approaches most nearly to the human figure. Thus there is one species of the ape tribe, in which the head has a facial angle of forty-two degrees; in another animal of the same family, which is one of those *simiæ* approaching most closely to the human figure, the facial angle contains exactly fifty degrees. Next to this is the head of the African Negro, which, as well as that of the Kalmuc, forms an angle of seventy degrees, while the angle discovered in the heads of Europeans contains eighty degrees. On this difference of ten degrees in the facial angle the superior beauty of the European depends; while that high character of sublime beauty, which is so striking in some works of ancient statuary, as in the head of the Apollo, and in the Medusa of Tisocles, is given by an angle which amounts to *one hundred* degrees."

Dr Prichard, in quoting this passage, remarks, that "the faculties of each race of animals seem to be perfect in relation to the sphere of existence for which they are destined;" and hence, in as far as the measurement of the facial angle is applied to the determination of the comparative intellectual characters of different tribes of the lower animals, he holds Camper's scheme to be imperfect and ineffective. As a method of distinguishing varieties in the shape of the actual cerebral case, moreover, the measurement of the facial angle is not always a safe guide. "I have now before me," says Blumenbach, "the skulls of a Lithuanian Pole and a Negro, in which the facial angles are nearly equal, but the difference between the shape of the two crania is otherwise prodigious." Nevertheless, as a general test of the mental capacity of individuals, "I think," says Prichard, "we must allow that experience is in favour of the position assumed by Camper. It is certain that every man is struck with the expression of dignity or elevation of mind and character in the ancient busts, which have a great facial angle, and that this expression would be lost if the facial angle were contracted. The fact seems, indeed, to be a general one, that men of great intellect have fully developed brains, as indicated by elevated and capacious foreheads." Since the time of Camper, it is scarcely necessary to tell the reader, the subject of craniology has been amply investigated by Dr Gall and his followers, who have founded upon their inquiries a system of mental philosophy in a great measure new to the world, and of which the fundamental principle is, that the size and form of the skull, as depending on the size and form of the brain within, denote the intellectual and moral character.

Whatever may be thought of the phrenological doctrine in its details, it is at least scarcely possible to dissent from the moderate conclusion of Dr Prichard, that "fully developed brains indicate great intellect." Hence, leaving out of the question the connexion of the development of the skull with that of the facial bones, the simple *capacity* of the cerebral case becomes in itself a matter of the highest consequence. We happily have it in our power, from the experiments of a most accurate inquirer, Professor Morton, to determine the comparative capacity of the skulls of all the varieties of mankind. The following are Professor Morton's conclusions:—

Having obtained a considerable number of the skulls of the various races of men, Dr Morton measured their internal capacity by means of white pepper seed, and found the following results:—

Races.	No. of skulls.	Mean internal capacity in cubic inches.	Largest in the series.	Smallest in the series.
1. Caucasian,	52	87	109	75
2. Mongolian,	10	83	93	69
3. Malay,	18	81	89	64
4. Aboriginal American,	147	80	100	60
5. Ethiopian,	29	78	94	65

It thus appears that the aboriginal Americans rank fourth with respect to the size of their brains, the Ethiopians being lowest and the Caucasians highest.

This result is certainly the precise one to be expected, considering the capacity of the cranium as an index of intellectual power. The Caucasian race, which stands highest in the scale, is that which has produced the most civilised nations; while the Mongolian, the next in order of capacity of cranium, has produced a number of nations which remain at a fixed point in semi-civilisation. The Malay is a degree more barbarous, and the American and Ethiopian the most barbarous of all.

Though thus compelled, both according to the views of Camper and those of other physiologists, to admit an inferiority of organisation, accompanied by inferiority of faculties, in certain races as they at present exist, there is yet an encouraging prospect to cheer us. Reasons exist for the belief, that cultivation, in the case of both races and individuals, is capable of modifying even the shape of the skull; and hence, whatever be the peculiarities attending this physical characteristic in any existing race, we are not left, in this view of things, to despair of the possibility of improvement. Without some such compensating prospect, it would be painful to admit that the protruded bones of the face, the proportionably small cerebrum, and the almost simious lowness of forehead in the Negro, indicated a natural inferiority in the race. Many writers will not, indeed, countenance this conclusion. "I have not met with an individual, out of a great number of intelligent West Indian planters and medical practitioners," says Dr Prichard, "who has not given a most positive testimony as to the natural equality of the African Negro and the European." The same writer also points to instances in which Negroes became excellent scholars, and wrote elegant Latin verses. But, on the other hand, Mr Lawrence, with many able physiologists,

gives countenance to the supposition of a decided inferiority of cerebral organisation in the Negro, attended with a corresponding inferiority of faculties. It is certainly one remarkable circumstance, that, in the majority, at least, of those cases in which Negroes exhibit striking talent, their heads are found to approach the Caucasian formation in respect of shape. Phillis Wheatley, for example, a coloured girl who wrote very pretty verses at an early age, is represented, in the plate attached to her little book, as having not only a Caucasian brow and head, but these of the finest order.

The physical characteristic now under consideration varies considerably among the white nations or Europeans. The Turks, who, though originally a Mongol race, have had their primitive physical attributes modified by continual intermixtures with Greeks, Georgians, and Circassians, present a form of skull combining, apparently, the mingled characters of the two varieties. The square Mongolian head has been rounded off in their case, and we find it to be now almost a perfect globe. The Greek head approaches the same shape. It was long asserted that the globularity of the Turkish head resulted from artificial compression in infancy, but modern physiologists discredit this notion. "A single glance at the Turkish head," says Mr Lawrence, "at the symmetrical and elegant formation of the whole fabric, the nice correspondence and adjustment of all parts, the perfect harmony between the cranium and face, in all the details of each, demonstrate most unequivocally that it is a natural formation, and a very fine work of nature, too." The writer now quoted proceeds also to remark, that, although no sufficiently extensive examinations have yet been made, the probability is, that between the European nations, such as the Germans, Swiss, Swedes, French, and others, distinct differences in the shape of the skull would certainly be found to exist on inquiry. Mr George Lewis observed in travelling on the continent, that the French have the lower and anterior parts of the cranium large, while the upper and anterior region is more prominent in the Germans. The Italian head, though comparatively small for the most part, is marked by great elegance. The Jews have long been noted for the fine Caucasian shape of their heads.

It is worthy of remark, that, though the globularity of the Turkish skull is not to be deemed the result of art, there are certainly races of people who modify the shape of the head by compression in childhood; and the views of Camper, as well as of the phrenologists, must be applied with some reservation to the skulls of one great variety of mankind. Many, very many, of the tribes of North and South America are so partial to low and retreating foreheads, that they have long been in the habit of assisting nature in producing that form of head. The comparative softness of the osseous texture at birth, and the partially mobile state of the cranial sutures, enable them to effect this object. "The Caribbs," says Labat, in his account of a voyage to the isles of the Caribbean Sea, "are all well made and proportioned; their features are sufficiently agreeable, excepting the forehead, which appears rather extraordinary, being very flat, and as it were depressed. These people are not born so, but they force the head to assume that form, by placing on the forehead of the newly born child a small plate, which they tie firmly behind. This remains until the bones have acquired their consistence; so that the forehead is flattened to that degree, that they can see almost perpendicularly above them without elevating the head." The consequence is, that the heads of these people, naturally somewhat depressed in front, become hideously so; and unnatural bulges behind show that the cerebral matter has been forced into new positions. The possibility of changing the form of the skull, has been doubted by some physiologists, but the circumstance is authenticated beyond all question. In Morton's *Crania Americana* are delineated many specimens of skulls thus altered in from, some so greatly changed by a pressure which has been applied both before and behind, as to resemble half-moons. It is not necessarily to be inferred that injury results either to the mental constitution, or the general health, of those who submit to this process. Supposing the pressure to be slow and gentle, the ductile organs will easily accommodate themselves to it, and it is probable that the brain, as far as its size or volume is concerned, will remain unaffected. A skull in Dr Leach's possession, bearing the marks of extraordinary compression, is known to have been that of a Caribb chief distinguished for intelligence and prudence.

TEETH OF MANKIND.

The general differences of features, accompanying these variations in the shape of the skull, were pointed out in going over the great divisions of the human race. The teeth of mankind differ very little in shape or position. "The oblique position," says Mr Lawrence, "of the anterior incisors in the Negroes, and some other tribes who have prominent jaws, is the only *national* difference I know of in teeth. Their size and form exhibit merely individual differences." One of the most remarkable individual varieties in the teeth, it may be observed, consists in the phenomenon of a double set in the same mouth. This is of rather rare occurrence, but the writer is aware of one instance, in which both upper and under jaw are encircled by a double row of extraordinary beauty. In case of a colonial settlement being founded by such an individual, and the dental duplicity being perpetuated in numerous descendants, would we not be apt, seeing a peculiarity so striking, to entertain doubts of the descent of the parties from the ordinarily jawed race of men?

FIGURE—PROPORTIONS—WEIGHT AND STRENGTH.

The differences which exist among the races of mankind, with respect to Figure, Proportions, and Strength, form a branch of the present subject not less interesting than any yet noticed. It has long been attempted, in the civilised regions of the world, to ascertain and fix a standard of physical perfection for the human body; and there certainly does seem to be a model, the closest approach to which combines the quality of pleasing the eye with the possession of the greatest degree of corporeal power and activity. Artists have usually looked to the model-figures of the Caucasians of Greece, or, in other words, to their ancient statues, as exemplifying the finest possible proportions of the human frame. But the taste of man varies so much, and habit modifies to such an extent his physical powers, that any standard of the kind alluded to must be open to numberless objections and exceptions. If judged of by the common artistical standard of the civilised world, certain races of men would be set down as out of proportion, and yet they possess physical powers of the most perfect kind. The Hottentot and the American savage will outrun wild animals, and hunt down the deer; the slim and "effeminate Hindoo," as we call him, will keep up with the horse for days; and the South Sea islander feels himself at home in a raging surf, which would whelm a boat or vessel. Yet these races depart widely, in many cases, from the Grecian model. Such facts show that physical power is at least not confined to men moulded after the Grecian artistical standard, though it may be that individuals so moulded would surpass in the exercises mentioned, with equal training, those otherwise fashioned.

STATURE.

Different races of men exhibit considerable diversities of stature, though there are no varieties of stature in different nations so remarkable as those which frequently occur in the same family. The tallest race of men, authentically known to exist, are the Patagonians, a tribe occupying the coast of South America, between the Rio de la Plata and the Straits of Magellan. The

territory occupied by them is of immense extent, and they are probably migratory in habits; hence a considerable degree of discrepancy in the accounts given of them by different writers. Magellan's companions declared the Patagonians to be commonly about seven feet four inches in height, English measure. Commodore Byron saw and conversed with many companies of them, and states that few were under seven feet, while others were considerably above it. Nearly six feet high himself, he could barely touch the top of a chief's head, though standing on tip-toe. Captain Wallis, again, having probably examined a different tribe, says that the majority of the Patagonians seen by him averaged from five feet ten to six feet, and that he only saw one man so tall as six feet seven. By later and accurate measurements, made by the Spaniards, we learn positively, that there are at least Patagonian tribes, reaching the average height of from six and a half to seven feet. Were they even somewhat less, they would be decidedly the tallest *race* of men existing on the face of the earth. All voyagers admit them to be large and muscular in proportion to their height.

A people situated in the polar circles of the north, stand nearly at the other extreme of the scale as respects stature. The Esquimaux, or at least some tribes of them, are for the most part between four and five feet in height, and their congeners the Laps are also a dwarfish race. They are of the Mongolian variety of mankind. The Ethiopic variety also numbers some very small tribes, and in particular the Bosjesmen, a race said to be also very commonly deformed. Among the American nations, there are also dwarfish tribes, and in particular the natives of Terra del Fuego, near neighbours of the Patagonians.

These nations only present us with the extremes of the human race, as respects stature. The subject is worthy of much more minute investigation. It would be highly interesting, and indeed instructive, to know the comparative average stature of each of the ordinary varieties and sub-varieties of mankind. Unfortunately, the observations of naturalists respecting stature have not been carried far. Quetelet and others have attentively examined the relative heights of individuals of *single* nations, at different ages, with a view to determine the general phenomena of man's growth; but few observations have been made upon the respective heights of different races or nations. The stature of the Caucasian has not been fully compared with that of the Mongol, or the Negro, or the Red Indian; nor have single nations, belonging to any of these great varieties, been satisfactorily contrasted with one another, as respects height. No accurate comparisons, for example, have yet been made of German with Spaniard, of Briton with Frenchman, or, in fact, of any one European nation with another. The following table, exhibiting the comparative heights of a small number of Englishmen and Negroes, is given in the work of Mr Lawrence upon the Natural History of Man. The Negroes were from various regions.

	Stature. Feet.	In.		Stature. Feet.	In.
An Englishman,	6	4½	A Negro,	5	10½
Ditto,	6	1	Ditto,	5	5½
Ditto,	6	0	Ditto,	5	8
Ditto,	5	9½	Ditto,	5	0
Ditto,	5	7	Ditto,	5	7½
Ditto,	5	4½			
Ditto,	5	0			

The Caucasian here has considerably the advantage of the Negro, the average height of the former class being nearly 5 feet 9 inches, while the black averages little above 5 feet 6 inches; and the advantage would still be on the same side, were we to leave the first Englishman, certainly a man of uncommon height, entirely out of the reckoning. But it must be admitted, that from such an insignificant amount of examples, no satisfactory conclusions can be drawn. The accounts of recent travellers in Africa would lead one to imagine that the majority of the Negro nations, excepting in the case of a few particular tribes, such as the Bosjesmans, are not below the Europeans in average height. The Caucasians have indeed the advantage in one respect; no tribe or section of them sinks so low in the scale of altitude as some of the other races do.

The stature of the Chinese, who must be regarded as amongst the purest specimens of the Mongol variety, was accurately and extensively measured by Mr Rollin, the surgeon who accompanied La Perouse. He found the ordinary height of the natives of the great Isle of Tchoka, on the east coast of China, to be *five French feet.** The natives of the mainland, near the same region, measured 4 feet 10 inches (French). This examination places the pure Chinese below the average height of Europeans, and, we believe, correctly. Other Mongol races have not been accurately examined, with a view to the point under consideration. In that variety of mankind, however, as in the Ethiopic division, there are individual races which stand much lower in the scale of height than any Caucasian tribe. The Esquimaux and Fins prove this assertion.

The Americans also present great differences in height; so much so, that it would be vain to attempt to discover or strike an average for the whole variety—a variety which comprises the giant Patagonians and the dwarfs of Terra del Fuego. For determining the heights of individual tribes of Americans, we have at present no better authority than the loose reports of travellers. The same may be said of the Malays; and, such being the case, it would be a waste of time to attempt any comparative estimate, having reference to these races. One conclusion may be drawn from the little which we do know, and that is, that civilisation equalises the stature of mankind, and keeps it near a steady mean. All the less cultivated races present extremes not to be observed among the Caucasians.

Professor Forbes of Edinburgh (the able successor of Leslie in the chair of Natural Philosophy) has recently made a series of experiments upon the physical differences between English, Scotch, Irish, and Belgians, the results of which constitute the most interesting information we are able to lay before the reader, with respect to the comparative heights of sub-varieties of the Caucasians. The following is a table drawn up by Professor Forbes, to exhibit the relative heights, at different ages, of the students attending his class, during a series of years, and belonging respectively to England, Scotland, and Ireland. The Belgian measurements were probably derived from other sources. The number of individuals subjected to examination was very considerable, so many as eighty Scotch and thirty English being occasionally measured at once.

Heights—Full dimensions with shoes.†

Age.	English.	Scotch.	Irish.	Belgians.
	Inches.	Inches.	Inches.	Inches.
15	64·4	64·7	...	61·8
16	66·5	66·8	...	64·2
17	67·5	67·9	...	66·1
18	68·1	68·5	68·7	67·2
19	68·5	68·9	69·4	67·7
20	68·7	69·1	69·8	67·9
21	68·8	69·2	70·0	68·0
22	68·9	69·2	70·1	68·1
23	68·9	69·3	70·2	68·2
24	68·9	69·3	70·2	68·2
25	68·9	69·3	70·2	68·3

This table places the Irishman uppermost in the scale of stature, the Scotsman second, the Englishman next, and the Belgian lowest. The comparison seems to be fair as regards the parties taken, for, if there were any peculiarity in their condition as students, it

* The French foot slightly exceeds that of England, the proportions of the former to the latter being as 1066 to 1000.

† Half an inch may be reckoned as equivalent to the shoe.

must have been common to all. As a comparison of national heights, therefore, the table perhaps exhibits conclusions pretty generally applicable, and we shall find it borne out by similar comparisons of *weight* and *strength*. Professor Forbes's observations are confirmed, in one point at least, by the following passage in Quetelet's work upon Man:—"When in England, we chose the terms of comparison from rather higher classes of society [he has been speaking of English factory *children*]; we find the stature of man rather *higher* than in France or the Low Countries, at least for young persons between eighteen and twenty-three years of age." Quetelet then alludes to eighty different measurements of Cambridge students, taken in groups of ten each. The average height of every ten was 58 feet, or 5 feet 9 inches and 3-5ths to each man. This is above Professor Forbes's average; but, as the English universities are only attended by the aristocracy, who are undeniably a section of the people above the average national stature, it is probable that, as a national comparison, Professor Forbes's table approaches nearest to the truth.

The table alluded to indicates the cessation of growth to take place at twenty-two, the case of the Belgians being the only exception. This exception may be accidental, but it is remarkable that Quetelet, a Belgian writer, and whose observations were chiefly drawn from Brussels and Brabant, lays down the following as one of his conclusions:—"It does not appear that the growth of man is entirely completed at twenty-five years of age." One can scarcely doubt the accuracy of this conclusion, which was founded on an examination of 900 individuals at the ages of nineteen, twenty-five, and thirty. It is perfectly possible, however, that climate and other circumstances may cause a difference in this respect between the Belgians and British. We learn from another of the valuable inferences made by Quetelet from his investigations, that the stature is materially influenced by residence in town or country. "The stature of the inhabitants of towns, at the age of nineteen, is greater than that of the country resident by 2 or 3 centimetres." An examination, accompanied with vast labour, of not less than 3500 individuals living in towns, and 6000 residing in the country, brought Quetelet to this conclusion, which is therefore in all probability correct, and will be found to hold good in all situations. It was only at the age of nineteen, however, that the stature of the townsman was found by Quetelet to exceed that of the rustic; and he conceives it possible, though it was not in his power to obtain full proof on the subject, that "the inhabitant of the country may attain to a greater height than the inhabitant of the town, before the completion of the full growth." The truth is, that circumstances greatly modify the rate at which the growth is developed. The law of nature on the subject is thus stated by Quetelet:—"The growth of the human being, from several months before birth up till the period of complete development, follows such a law of continuity, that the accessions of growth diminish regularly in amount, in proportion to the age." Here, of course, each successive addition of growth is considered relatively to the growth previously acquired. "We shall find," he says, "that the child increases in size 2-5ths from birth to the end of the first year; 1-7th during the second year; 1-11th during the third year; 1-14th during the fourth year; 1-15th during the fifth year; 1-18th during the sixth year, and so on; the relative growth always decreasing from the time of birth." This simple law of nature, however, is liable to be greatly affected in its operation by circumstances. "Dr Villerme remarks," says Quetelet, "that the height of man becomes greater, and the growth takes place more rapidly, other circumstances being equal, in proportion as the country inhabited is richer, the comfort more general, houses, clothes, and nourishment better, and labour, fatigue, and privations less during infancy and youth; or, in other words, the circumstances accompanying misery put off the period of the complete development of the body, and stint human stature." There can be no doubt of the accuracy of these remarks. The simple exposure to the action of cold, not to speak of toil, materially influences the growth of man; and we see this proved, conversely as well as otherwise, in all the extreme climates of the world. The warmth and luxury of cities develop rapidly the growth of all but the lowest classes. Our British gentry bear out fully the conclusion of Quetelet, that "individuals who enjoy affluence generally exceed the mean height; hard labour appears to be an obstacle to growth."

Two other conclusions, of those which Quetelet gives as the result of his patient and cautious investigations, are as follow:—"The limits of growth in the *sexes* are unequal; first, because woman is born smaller than man; secondly, because she sooner reaches her complete development; thirdly, because the annual increase of bulk which her frame receives is smaller than that of man." The seventh and last deduction is, that, "from the fiftieth year, the human body undergoes a diminution of stature, which becomes more and more marked towards the close of life." The writer does not assert that the declension is more than in appearance, and it probably is nothing more, though not less palpable to measurement than if real. On the other points it is unnecessary to make any remark. The present treatise cannot be carried beyond generalities, and we must be content, in many particulars, to regard the sexes only under the common title of mankind.

WEIGHT OF THE HUMAN BEING.

The stature, weight, and strength of the human body, form but parts of one and the same subject. Each of these properties or characteristics, if not dependent on, is at least closely related to, both the others. As the object here is to make the view of the species comprehensive rather than minute, it were to be wished that the *weight* of the body, among the various races of men, had been inquired into with some attention by naturalists. But, as in the case of the stature, this has yet been done only to a very imperfect extent. Quetelet has fully examined the comparative weight of the human body at different ages, and of differently placed individuals in a single nation; but no attempts have been made to determine the comparative weights of Mongol and Caucasian, or American and Negro. The endeavour to do so would be attended undeniably with vast trouble, and some may think the matter not worthy of it. This, however, is not a correct view of things. In all undertakings that require the exertion of physical energy, and more particularly in war, bodily weight, it has now been clearly shown, is a most important element; and, wherever the superiority in this respect lies, thither will success, other circumstances being equal, almost infallibly tend. An observation of the various collisions of troops on the field of Waterloo, whether of horse or foot, has been found to substantiate this proposition.

Professor Forbes extended his inquiries among his students, English, Scotch, and Irish, to bodily weight, adding examinations of similar, and also of mixed classes of Belgians. The results were as follow:—

Weight in Pounds, including Clothes.

Age.	English.	Scotch.	Irish.	Belgians (not mixed classes).
	lbs.	lbs.	lbs.	lbs.
15	114·5	112	...	102
16	127	125·5	129	117·5
17	133·5	133·5	136	127
18	138	139	141·5	134
19	141	143	145·5	139·5

25	151	152·5	155	150

Here, again, the superiority lies with the Irish, the others holding the same relative positions as in the case of stature. The mixed classes of Belgians, in whose case the weight of clothes was deducted, ranked exceedingly low—134 lbs. being about the average. We have it in our power, fortunately, to compare the conclusions of Professor Forbes with those of other inquirers, in as far as the English and Belgians are concerned. The eighty students of Cambridge, weighed (with the clothes) in groups of ten, gave an average, as we are informed by Quetelet, of 151 lbs.—the precise mean, it will be observed, of the Englishmen of twenty-five years of age weighed by Professor Forbes. The Cambridge students, however, were between eighteen and twenty-three years old, and therefore the Cambridge estimate is a little higher than that of Professor Forbes, as it also was in the case of stature. With respect to the weight of the Belgians, as examined by Quetelet, he states that the mean weight of the Cambridge students of eighteen and twenty-three much exceeds that of Belgians of the same age, being nearly the same as that of men of *thirty* in Brabant and the other departments of Flanders.

The superiority of the Irish in point of stature and weight is remarkable. We shall find it borne out by a corresponding superiority in physical power, as shown in the table of Professor Forbes having reference to that characteristic.

Quetelet's conclusions respecting the weight of the human being at various ages, and the general laws regulating his growth in this particular, are nearly as follows:—The mean weight of male children at birth is 3·20 kilogrammes.* The weight of female infants is less, being 2·91 k. A child loses weight for the first three days after birth, and does not make any decided increase until about the seventh day. Ages being equal, man generally weighs more than woman; but at the age of twelve this is not the case. The sexes are then nearly equal in this respect. The period of complete development in man, as respects weight, is the age of forty; woman, again, does not attain her maximum till the age of fifty. According to observations made on the most extensive scale in Belgium, the mean weight of man at twenty-five is 62·93 k.; at the age of forty (the maximum period), it is 63·7 k. The mean weight of woman at twenty-five is 53·2 k.; at fifty (the maximum period), it is 56·16 k.† The maximum weight of the human being is nearly twenty times the sum of his weight at birth. The mean weight of the human being, neither sex nor age being taken into account, is 45·7 k. From the ages of forty and fifty, men and women begin respectively to sustain a decrease of weight, from six to seven kilogrammes being the usual loss before the close of life.

STRENGTH OF MAN.

The strength of the human frame is a subject which has received much more attention than has been paid either to its weight or proportions. It is obviously, indeed, a subject of the utmost moment, whether we view it with reference to the comparative physical powers of different races, or simply as a question interesting to civilised man from its bearing on practical mechanics. Various methods have been proposed for determining accurately the strength resident in the loins and arms of the human frame; and the instrument called the *dynamometer*, invented by Regnier, is that most generally approved of and employed for the purpose. The dynamometer, however, though used by Quetelet, Professor Forbes, and others, in their experiments, is allowed to be far from perfect, and it is only by uncommon care and caution, that results can be obtained from it worthy of being depended on. It is an instrument which cannot well be described in mere words, and all that may be said of it here is, that it is so contrived as to indicate to the experimenter, on a dial-plate, the physical power resident in the loins and arms of the parties subjected to trial.

Observing the extraordinary displays of physical power and energy frequently made by savages, scientific men were long of opinion that civilisation diminished the strength of the human frame. Other circumstances tended to foster this belief. The Negro is possessed of longer arms, or at least forearms, than the Caucasian, holding in this respect, it is worthy of remark, a middle place between the white and the ape, which latter creature has arms of great length. "I measured," says Mr White, "the arms of about fifty Negroes, men, women, and children, born in very different climes, and found the lower arm longer than in Europeans, in proportion to the upper arm and height of the body." The same writer says that whites of 6 feet 4 inches, whom he measured, had shorter arms than Negroes of middle size. Similar sources of physical superiority appeared to voyagers to be possessed by the Pacific Islanders, the Malays, and many other uncultivated races. But more attentive observation has disproved the supposition. The voyager Peron, took with him to the southern hemisphere a dynamometer, with which he experimented on the following number of individuals: twelve natives of Van Diemen's Land, seventeen of New Holland, fifty-six of the island of Timor (a fine race of men), seventeen Frenchmen, and fourteen Englishmen. The following numbers express the mean result in each case, the strength of the arms and loins being respectively put to the test. It is by lifting a weight that the strength of the loins is tested with the dynamometer.

Mean strength.

	Arms. Kilogrammes.	Loins. Myriogrammes.
1. Van Diemen natives, -	50·6	...
2. New Hollanders, - -	50·8	10·2
3. Timorians, - -	58·7	11·6
4. Frenchmen, - - -	69·2	15·2
5. Englishmen, - -	71·4	16·3*

The highest power of arm shown by any of the Van Diemen natives, was 60; by the New Hollanders, 62; while the lowest in the English trials was 63, and the highest 83. In *lumbar* power, or that of the loins, the highest point reached by a New Hollander was 13; the lowest of the English was 12.7, and the highest 21.3.

"These results," says Mr Lawrence, "offer the best answer to the declamations on the degeneracy of man. The attribute of superior strength, so boldly assumed by the eulogists of the savage state, has never been questioned or doubted. Although we have been consoled for this inferiority by an enumeration of the many precious benefits derived from civilisation, it has always been felt as a somewhat degrading disadvantage. Bodily strength is a concomitant of good health, which is produced and supported by a regular supply of wholesome and nutritious food, and by active occupation. The industrious and well-fed middle classes of a civilised community, may be reasonably expected to surpass, in this endowment, the miserable savages, who are never well-fed, and too frequently depressed by absolute want and all other privations." Such is the case, as Peron's experiments show. But indeed the same thing is shown by a hundred historical facts. The Spaniards, on their first visits to the New World, found the natives much weaker than themselves, and this was proved not only by hand to hand struggles, but by the labour of the mines, in which the Indians were far deficient. The backwoodsmen of the States have always shown themselves stronger, in single combats, than the Indians. The Russians of Europe, also, are said by Pallas to excel the Mongol tribes of the empire, to a remarkable extent, in physical power.

Proper and extended comparisons are yet to be made of the relative physical power of the various Caucasian nations. The following table of Professor Forbes gives

* A kilogramme is as nearly as possible 2 1-5th lbs. English.

† The mean weight, therefore, of man in Belgium, at the maximum period, is little more than 140 lbs. English. This is much below the average of man in Britain.

* Peron—Corrected Edition of his Voyages. (The myriogramme is nearly 23 lbs. English.)

us at least a glimpse at the comparative strengths of English, Scotch, Irish, and Belgians :—

Lumbar strength in pounds.

Age.	English.	Scotch.	Irish.	Belgians.
15	...	280	...	204
16	336	314	...	236
17	352	340	369	260
18	364	360	389	280
19	378	378	404	296
20	385	392	416	310
21	392	402	423	322
22	397	410	427	330
23	401	417	430	335
24	402	421	431	337
25	403	423	432	339

The same relations are here preserved as in the previous tables, and as, with respect to weight and height at least, there could be no mistake, the probability that the last table is correct is much strengthened by the conformity in question. The difference between the Irish and Belgians is immense, the former exceeding the latter in strength by nearly one-fourth; while between the English and Belgians there is also a great difference, amounting to 62 pounds. The English, in Peron's table, showed a lumbar strength equal to about 376 lbs., a point considerably below that of the English in Professor Forbes's table. But we might expect such a difference between students and sailors, or stout colonists, which latter classes were those examined by Peron. Between the Scotch and Irish the difference is small comparatively. It is much to be wished that the example of the Edinburgh professor were extensively followed, both abroad and at home, so as to give us satisfactory views of the relative physical powers of the different European nations. Such questions, as already hinted, will be found to bear more directly on the prosperity of nations than has hitherto been commonly imagined.*

Regnier, the inventor of the common dynamometer, was led to the conclusion, after many experiments, that, between the ages of twenty-five and thirty, man is at the maximum of his strength, and that he is then able, by pressing strongly with both hands, to make an effort equal to 50 kilogrammes, and to raise a weight of 13 myriogrammes. Man preserves (says the same observer) much of his physical power nearly till the age of fifty, when it diminishes progressively. The experiments of another Frenchman, M. Ransonnet, made upon 345 of his countrymen, sailors of the port of Havre, give results somewhat different from those of Regnier. Ransonnet found the mean manual power of these men to equal 46·3 kilogrammes ; and the lumbar power, or that of the loins, to amount to 14·2 myriogrammes. There is every reason to believe, however, that the particular mode of using the instrument, employed by each experimenter, is the cause of such differences in its results. Quetelet's observations led to the following conclusions :—

Lumbar Power of Men and Women.

Age.	Men. Myriogrammes.	Women. Myriogrammes.
9,	4·0	3·0
15,	8·8	5.3
20,	13·8	6.8
25,	15·5	7·7
30,	15·4	...
50,	10·1	5·9

The highest point which the dynamometer here gave, for the power of the loins in Belgian men, was 15·5, twenty-five being the age when the power reached this maximum point. The conclusion agrees very closely with those made by Peron on the French sailors of his party, who exhibited a lumbar power equivalent to 15·2 myriogrammes, falling below that of the English, which was 16·3. Other observations, however, would lead us to suppose that the difference is more in favour of the British, when compared with the Belgians, than this calculation would indicate; and this would probably have appeared, had Britons been tested under Quetelet's own eye, and by his directions.

The difference in lumbar strength between men and women is remarkable, as shown in Quetelet's table. At the age of twenty-five, when both attain the maximum of lumbar strength, the woman is deficient by more than one-half. "The difference," says Quetelet, "is commonly less in early youth than at the period of complete development, the ratio being at first as 3 to 2, and becoming afterwards as 9 to 5. The power of the right hand, when tried separately from that of the left, exceeds that of the latter by nearly a sixth. If the results which I have attained be compared with those of MM. Regnier and Ransonnet, differences of a remarkable kind will be observed, which I ascribe to the manner in which the hands were laid upon the instrument, and to the distance left between them. According to the researches, however, of the gentlemen mentioned, the mean strength of man is estimated at about 46·3 and 50 kilogrammes, a weight not equalling that of man himself. Hence a man should not be capable of supporting himself with his hands. Now, experience tells us the very opposite of this. Among the sailors examined by Ransonnet, there would not probably have been found a single man who could not sustain himself for some instants at the end of a rope. Peron, who estimates the manual force at 69·2 kilogrammes, approaches nearer to the truth, but my own experiments carry the estimate considerably higher."

These conflicting results cannot but lead us to look with suspicion on the dynamometer, when in the hands of *different* experimenters. But the conclusions of single experimenters, who have compared a variety of individuals, are still to be held of value, since they would cause the different subjects of experiment to operate on the instrument in the same way. The conclusions of Peron respecting civilised and uncivilised men, as well as Englishmen and Frenchmen, are by no means to be deemed unworthy of credit, because Quetelet arrived at different general conclusions; and the same may be said of the observations of Quetelet upon the comparative strength of man and woman at different ages. To the observations of Professor Forbes the same remark applies, and we believe, with reference to them, that the conclusions which they indicate will hold extensively good. The Belgians partake largely of the Celtic blood, and the Celtic race will probably be found inferior to the Germanic, in almost all cases, in height, weight, and strength of frame. The superiority of the Irish, it may be thought, does not countenance this view of things, as they are in the main a Celtic people. But it is the English portion of the Irish population, chiefly, who are in circumstances to quit their country in quest of academical education, and such was, in all likelihood, the character of the majority of those who became the subjects of experiment to Professor Forbes. The peasantry, in some of the more retired districts of Ireland, present characters very different from those of the parties settled within what was called the English "pale." They are pure Celts, unquestionably, with short, spare, wiry frames, and features strikingly Celtic. Not to these, but to the English portion of the nation, must the conclusions of Professor Forbes be held chiefly to apply; and the people of the Scottish Lowlands, who encircle and attend the Edinburgh University, are, in like manner, a Germanised race. It is in this light that English, Scotch, and Irish, are to be ranked together, and collectively contrasted, as being all of them branches of a Germanised population, with the continental Celts. In height,

* We have been informed that the mere physical power of the different companies of men to whom the Duke of Wellington was opposed in his campaigns, was always with him an object of serious consideration.

weight, and stature, the superiority, we repeat, seems to lie with the former, and their national career may have been more affected by the circumstance than has hitherto been dreamed of. Future inquiries are likely to give to such physical characteristics a degree of weight not ascribed to them in times past.

Leaving the question of comparative degrees of strength, whether in varieties or sub-varieties of mankind, a word may be said respecting the extraordinary physical powers which *individual* men, of various nations, have occasionally evinced. We learn from history, that Milo, a Greek, could fell an ox with his fist, and afterwards carry it home on his shoulders. Firmus, a man who lived in later times, being born in Seleucia about the reign of the Emperor Aurelian, could suffer iron to be forged on an anvil placed on his breast, his body being then in the position of an arch, with only the two extremities resting on supports. He exhibited other feats of muscular strength, nearly all of which were successfully imitated, during the past century, by a German named Van Eckeburg. This man sat down on an inclined board, with his feet stretched out against a fixed support, and two strong horses were unable to move him from his position. In imitation of Firmus, he lay down, with his body in the form of an arch, and allowed a stone, one foot and a half long and one foot broad, to be broken on his abdomen with a sledge hammer. He also stood on an elevated platform, and by means of a rope round his waist, sustained the weight of a large cannon, a burden for several horses. A flat piece of iron was likewise twisted by him into the form of a screw.

Dr Desaguliers, a scientific gentleman who witnessed the German's feats, showed, however, that skill was more concerned in the matter than mere strength. With the aid of some friends, the doctor actually performed many of the same feats, on the very night on which he witnessed them. The simple sustaining of the stone, it seems, was the chief difficulty in the most striking of the experiments, as the breaking of it caused little additional annoyance; and, in place of increasing, the arched position of the body greatly diminished the shock of the blows. In the case of many of the other feats, in like manner, a skilful application of ordinary physical powers was found competent to their accomplishment. There appeared, nevertheless, about the same time with the German, an Englishman, named Topham, who performed equally wonderful feats by sheer strength, unaided by skill. He out-pulled a strong horse by main force, though in attempting to pull against two, he ultimately got himself hurt, being totally ignorant of the contrivances which his German predecessor used in aidance of his muscular powers. Topham rolled up pewter plates with ease, and unrolled them; he struck an iron poker, three inches in circumference and three feet long, against his bare right arm, till he bent it to a right angle; he placed a similar poker against the back of his neck, and, with a hand on each end, twisted it round, till the points met in front; after which he pulled it nearly straight again, his arms acting in a most unfavourable condition while he did so; and, finally, among other feats, he lifted with his teeth, and held out for a time, a strong table six feet long, with half a hundredweight hanging at the farther extremity.

We have accounts of men performing more wonderful feats than these of Topham, but they are either ill authenticated, or seem to have resulted as much from skill as strength, as in the case of the German. Topham appears, on the whole, to have been gifted with physical powers as remarkable as any that we can believe any human being ever to have naturally possessed, judging from the details on such matters given in merely secular history.

MENTAL CHARACTER.

It is only a recapitulation of much which has been *stated in the earlier sections of this* treatise, that great *varieties of mental character* are exhibited by the *the races of mankind.* The black intertropical nations generally, are decidedly the lowest in t lectual scale. They are generally characterised indolence, as well as by gross barbarism an stition. The idea of a social community has n a small advance amongst them, though more some tribes than others. The lowest of the cla be found in Australia and some of the island Pacific. Yet there is scarcely any tribe of h mean, but they possess certain traits of mind ca to produce respect, being in some instances sur ingenious in fabricating particular articles, or in nagement of canoes and the use of warlike imp

The red races of North America are a cons superior race to the Negroes. Their associa war and other purposes are upon a more con scale; they show many remarkable traits of in and in many tribes we find kindness and cour proaching to our ideas of the chivalric charact

The Mongolians, and the Indian branch of t casians, must be considered next in the scal have formed great states, and made advances in and in science; but a stationary character appe impressed on them all, and ages pass witho manifesting the slightest moral or political i ment. The Malayan variety exhibits a somew rior character to the Mongolians, but not so as to call for special notice.

The Caucasian variety, as a whole, stands above all the rest. It is characterised by sagacity and sentiment, and, above all, by a pro character which other races have only shown i limited degree. The social arrangements fo some branches of this race, are the most calcu ensure the general happiness which have ev known. Their industry and perseverance, aide lights which they have deduced from science, to the production of an amount of wealth bey dreams of Orientals. Their benevolence has not only to found institutions calculated to suc poor and afflicted in their own country, but themselves for the benefit of other nations i region of the globe. Wherever this race sets it makes itself master—a result directly flowing superior energy, skill, and perseverance. Amo branches of the Caucasian variety, consideral rences prevail. The Indian branch approache Mongolian variety, and it is in the Pelasgian b ancient, and the Teutonic or German in moder that we find the utmost development of the fine ties of the species.

PERMANENCY OF TYPES.

This subject has been already touched upon calls for some special consideration. We fi interesting light thrown upon it in a work "The Physiological Characters of the Races kind considered in their Relations to History," W. F. Edwards.

This writer cites the Jews as an example o who, for nearly two thousand years, have been throughout a variety of climes, yet have ever preserved their original features. In Leon Vinci's picture of the Last Supper, painted thr dred years ago, the figures are represented wi tenances exactly resembling those of the Jew present day. That the present well-known typ people has undergone no change at any time, is by the paintings found by Belzoni in the tom Egyptian king, probably not less than three t years old. These paintings represent four races in procession—1. The natives, of a dark tint; 2. Negroes, with black skins, thick lips, an hair; 3. Persians; 4. Israelites, distinguished complexion and physiognomy. The paintin exhibited in London, where Dr Edwards part examined them: he says, "I had seen, on the p day, Jews in the streets of London; I though now saw their portraits."

Dr Edwards shows that there is much error

...; and the British, though they have exterminated the untameable savages of Van Diemen's Land, to contemplate encouraging into their service the docile races of New Zealand. Reason is shown by Edwards for concluding that, in several European countries which have passed through the hands of foreign masters, the bulk of the people are still the same as in very remote times. Rome, and the Papal States, yet show a people of exactly the same type of face with the ancient Romans, as represented in busts and upon bas-reliefs. A people of one type, supposed to be that of the ancient Gauls, were distinctly traced by Edwards in eastern France and in northern Italy. He also adduces reasons for believing that the Britons still form a large portion of the present population of England. History itself, rightly read, confirms those propositions. The Franks, who acquired the country in Gaul in the fifth century, were rather a navy than a migratory nation. The Lombards, who overran and seized the northern half of Italy, are stated to have only been about 100,000 in number. The immigration of the Saxons into England, seems to have been upon a greater scale; but the Normans, led by the Conqueror, were only 60,000 soldiers.

The stability of the people on their original ground, and the permanency of their original character, are shown in a striking manner by the description which Tacitus gives of the Gauls, Britons, and Germans. Gaul he speaks of as "gay, volatile, and precipitate to rush to action, but without the power of resisting adversity and the tug of strife; and this is the character of the Celtic portion of the French people even to the present day. He represents the Britons as brave, considerate, and acute, possessed of intellectual talent, and says that he prefers their aptitude to the fickler manners of the Gauls. The same mental traits characterise the English of the nineteenth century, and they and the French may still be contrasted in similar terms. He describes the Germans, during the state of their civilisation, as a bold, free, self-denying, and virtuous people, possessed of a fierce set of characters; and the same features distinguish them still." It is scarcely necessary to remark, that the blue eyes and fair hair which the Roman writer attributes to the Germans, are still widely-existing features of their external physiognomy.

The perseverance of national types is supported by instances favouring the same conclusion with respect to individual families. It has been repeatedly observed, in galleries of family portraits, that a particular style of face, or some shape of feature, is handed down from one generation to another, or, passing perhaps over one or two generations, revives in a third. A certain thickness in the under lip has been thus hereditary in the royal family of Austria for several centuries. The face of the British royal family has presented nothing but minor changes since the Elizabethan age, if not from earlier generations. Mr Willshire, in his work entitled "Visits to Remarkable Places," gives a portrait of a school-boy who was

trait of Sir William Wallace. He had previously, as might be supposed, no inclination to attach any credit to that portrait, but he could not help being greatly surprised when, upon inquiry, he learned that the gentleman who had just passed was General Dunlop of Dunlop, whose mother he well knew to have been the daughter of Sir Thomas Wallace of Craigie, the last lineal descendant of a branch of the family of the Scottish hero. It may be added, that the rencontre took place sixty miles from the seat of General Dunlop. As Wallace is now known to have visited France, it is not impossible that his visage may have been painted; or, supposing the portrait not his, it is likely to be that of some early member of the Wallace-Craigie family, in which case the anecdote would be not much less valuable as a proof of the long descent of a family face.

EFFECTS OF LOCAL CIRCUMSTANCES IN PRODUCING CHANGES.

On the other hand, there are proofs of considerable alterations having been produced in the external features of races by peculiar local circumstances. The descendants of the English settlers in the American states display a considerable variation, in general form and aspect, from the parent nation. The children of European settlers in New South Wales, are tall, thin, and weaker than their progenitors. In the West Indies, some distinct new peculiarities of structure have been observed in the descendants of English settlers. Their cheek-bones are higher, and their eyes deeper set in the head, than those of the English nation generally. In these respects, they approximate to the form of the aboriginal races of the American continent and islands; and it has been pointed out that such a form is useful in protecting the eye-sight from the glare of the tropical sun. The Creoles have also cooler skins, and are keener of sight, and more supple in the joints, than the English. It has been remarked of the descendants of Africans in the United States, that, after three or four generations, their features lose much of the native African cast, and approximate to those of the white people, the mouth becoming smaller, the eyes lively and sparkling, the nose higher in the ridge, and the hair considerably longer and less crisp.

Analogous circumstances are observed amongst the lower animals. For example, the woolly sheep, brought into a tropical climate, loses its fleece, and retains only a thin coat of hair. The hogs of Cuba, all of which are descended from an European stock, are twice as large as modern European hogs. The horses which run wild in Paraguay, though all descended from variegated European races, are now of one peculiar colour, which we cannot doubt is the effect of some peculiar local circumstances.

Dr Prichard says—"On considering these and analogous phenomena, we can hardly avoid concluding that the variations of animals proceed according to certain laws, by which the structure is adapted to the necessity of local circumstances." If such be the case, it must be held as a circumstance favourable to the supposition that all the races are sprung from one stock. The variations might, in that case, be regarded

as altogether produced by local circumstances operating during a long course of time.

It is certain that the Negro skin, and, indeed, the whole Negro constitution, are better adapted for a tropical climate than those of the white man. It is also true that intertropical countries all round the globe are inhabited by black races, excepting only those in tropical America which are so much elevated as to enjoy a temperate climate. We here see much reason for believing that the Negro is a being adapted, in a special manner, to live in a high temperature; and this seems the more likely, when we consider that blacks, on settling in northern latitudes, become the victims of several severe ailments, which seem to forbid that they should ever multiply in such countries. Blacks, indeed, and whites, appear to be respectively adapted to tropical and to temperate latitudes; and their attempts to interchange their proper situations are not in general attended with good effects, although, as we have seen, there is reason to believe that nature makes an effort, to a certain extent, to accommodate them to the changed circumstances.

CONCLUSION.

From all that has been written or learned on the subject of man's physical and social history, it appears evident that the constitutional character of the human being admits of a very high degree of culture and improvement. Nature ushers him into existence more weak and helpless than any of the lower animals, and, left uncultivated, he grows up an ignorant savage. In the most debased condition, however, in which he can be found, he possesses the rude elements of intelligence, and aspires to a destiny altogether beyond the reach of the creatures over which he has acquired dominion. His pre-eminence in the scale of being may be proximately traced to the structure of his brain, or organ of thought, which greatly exceeds in relative magnitude that of any of the lower animals; likewise to the capacity for speech; and to his upright posture. His superior mental development, when operated upon by a combination of happy circumstances, usually classed under the name of education, enables him to trace effects to causes, to convey an account of his experience to his fellows, and, above all, to put not only this experience but his numerous and varied thoughts, on record for the benefit of future generations. In this manner, the savage, which man originally is, is gradually improved. Each new generation enjoys the benefit of an accumulated experience; and at last, as cultivation advances, man is found to be a highly intellectual being, with a frame more elegant and powerful than he possessed when his race was in a state of heathen darkness.

Indian Savage.

Under an all-wise Providence, man has assuredly been placed on this earthly scene to perform a part immeasurably more dignified than that assigned to the lower orders of animals, each of whose generations is in no respect advanced, and cannot possibly advance, beyond the precise and humble station which was first occupied by its race. "In this point of view," to use the language of Lawrence, "man stands alone: his faculties, and what he has effected by them, place him at a wide interval from all other animals—at an interval which no animal hitherto known to us can fill up. The man-like monkey, the almost reasonable elephant, the docile dog, the sagacious beaver, the industrious bee, cannot be compared to him. In none of these instances is there any progress either in the individuals or the species."

Elevated, however, as is the meanest among human beings above the higher of the animal tribes, it is evident that for the proper performance of his part he *must* employ means for advancement, else he rests in a condition of ignorance and barbarism most deplorable to contemplate. Placed in a large and beautiful world, abounding with animal and vegetable existences at his command, and accountable for his conduct, it behoves him to pursue such a course of activity as will enable him to enjoy the full benefits of his situation. By pursuing that line of policy which leads to social melioration, he rises step by step to a high degree of civilisation, and bequeaths to posterity almost imperishable monuments of his greatness. Attaining this enviable height, should he pursue or be the victim of a contrary line of policy, he sinks in the same ratio, and perhaps with greater speed, down to the original and humble level from which he had formerly arisen.

To be assured that these are not merely conjectural speculations, we have only to direct our attention to history, wherein examples are offered of the gradual rise, the eminence, the decline, and the ultimate extinction, of civilisation. Again, like the growth of a new order of plants on the soil of an exterminated forest, we find on the spot once consecrated by deeds of human greatness, a different branch of the family of mankind, pursuing by toilsome steps a similar rise from barbarism, and asserting, in their turn, the exalted capacity for improvement common to all varieties of our race.

Although it is established both by scriptural record and geological discoveries, that man was placed on earth last in the series of animal existences, his race possesses a sufficient antiquity to embrace various instances of the rise and decay of nations at a period so remote as to be beyond the reach of ordinary record, and only known by the wrecks of man's inventive genius. Thus, in the east, are found remains of architecture and sculpture, of the origin or meaning of which the oldest known nations were altogether ignorant, and which are a puzzle to modern archæologists.* Thus, also, throughout North and Central America, there are found vast monuments of antiquity and objects of art, of a date long anterior to that of the earliest recorded nations, and which these nations looked upon with awe and wonder. The valley of the Mississippi, in particular, abounds in an immense quantity of artificial mounds of various shapes and sizes, and forts of different kinds, the origin of which is altogether unknown, but which are doubtless the remains of an extinct civilised race. This country, as is well known, was found, in the earlier periods of American discovery, in the possession of those red races usually called Indians, who are now retiring before the advance of the whites. These red races manifest no symptom of possessing, or of ever having possessed, either the power or the inclination to erect such works: they disclaim having erected them, and in their traditions speak of them as the productions of a people who were their predecessors in the country, and have long been extinct.

Enlightened Englishman.

To close this imperfect sketch of man's physical history, we have only to add, that from all the existing remains of antiquity, both in the eastern and western hemisphere, and from all written history, it conclusively appears that mankind, taken in the mass, have in no respect degenerated in physical structure, but that individually they are as tall, bulky, and powerful, as they were in the earliest periods of their progress, while, as respects mental qualifications, they now, in all enlightened societies, occupy a station in the scale of being which it is reasonable to conclude was never before enjoyed.

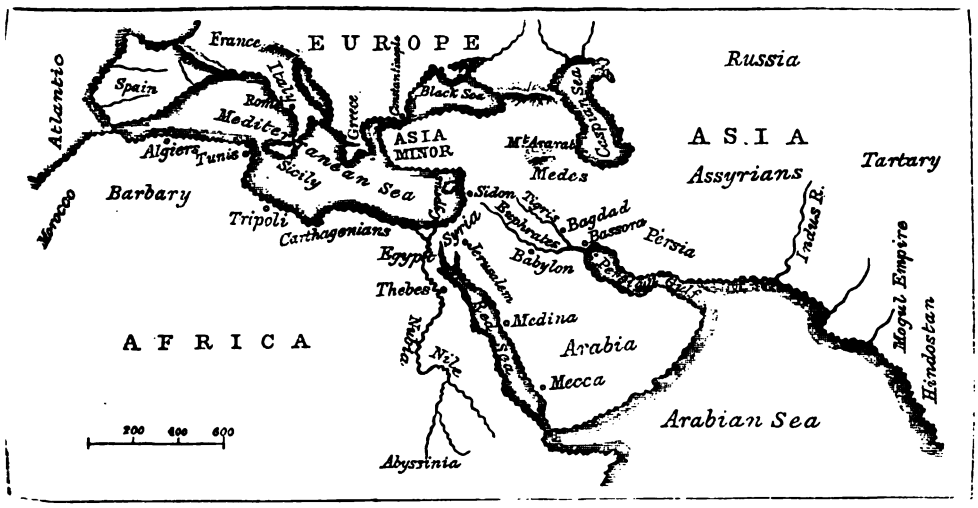
ANCIENT HISTORY—EGYPT.



Great Pyramid of Cheops, in its present condition.

ANCIENT HISTORY usually commences with an account of the creation of the world as narrated by Moses—the subsequent dispersal of mankind over the earth—the flood of Noah—and the re-settling of the human race in Asia, Africa, and Europe, after that disastrous event. But to the annals of these early times it is unnecessary here to advert. We take up the history of antiquity at a period less remote, or from 2000 to 1000 years before Christ, when Egypt and the adjacent territories were illumined with the light of science and the arts.

It is important, at the outset of our sketch, to call attention to the fact that the whole of ancient history refers to a limited cluster of countries, on or near the shores of the Mediterranean. By a glance at the accompanying map, it will be perceived that Egypt, also the country of the Carthagenians, in Africa; Syria and Palestine (including the country of the Phœnicians), Arabia, the country of the Chaldeans, Babylonians, Medes, Persians, and Assyrians, in Asia; and Greece, Italy, and other countries of the Gentiles, in Europe—all lie upon, or at no great distance from, the Mediterranean. To the countries, therefore, adjacent to this inland branch of the Atlantic Ocean, the knowledge of the ancients was chiefly confined, or at the utmost did not extend in an easterly direction beyond Hindostan, or the country of the Moguls. In consequence of this limited knowledge of geography, as well as the natural but very erroneous notion that the world was only a great stretched-out plain, the Mediterranean sea received the name it now bears, which signifies the *sea in the middle of the earth*—the central ocean round which the human race had been planted.

The world as thus known to the ancients, may be described, in general terms, as a region extending from the 10th to the 50th degree of north latitude, and from the 1st degree west to the 70th degree of east longitude, and comprehending only limited districts of Africa, Asia, and Europe—the whole composing a most insignificant portion of the globe. As far, however, as is learned from the records of sacred and profane history, it was in some spot within this anciently settled territory that science, learning, and the arts, originated, and spread over the earth; and as thus forming the cradle of modern civilisation, the region is invested with an interest due to its former greatness. Yet the political

history of the empires and kingdoms which anciently flourished in this once favoured territory, is on the whole unworthy of lengthened study. Time is only thrown away in the vain endeavour to unravel the vague and offensive details of kingdom warring against kingdom, tribe against tribe, and each in its turn assailing and overpowering its more feeble neighbour. Thus, the Chaldeans in the south-east of Arabia were overpowered by their neighbours the Babylonians, the Babylonians by the Assyrians, the Assyrians and Egyptians by the Persians, the Persians by the Greeks, and the Greeks by the Romans, while these latter, who had swallowed up the whole of their predecessors, were in their turn overpowered by barbaric hordes from the north of Europe, or by nearly equally savage tribes from the east. In this manner the bulk of ancient history is little else than a record of oppressions, conquests, and crimes, and in the main exhibiting few facts which are of value either for amusement or instruction. Ancient history is indeed only interesting where it throws light upon the origin and progress of our religion, or upon the primeval state of learning, philosophy, and the arts; as a chronicle of mere wars and conquests, it is utterly valueless.

Whatever may have been the extent of knowledge in letters, science, or the polite arts, gained by the ancient Chaldeans, Babylonians, or other Asiatics, it is generally understood that it fell short of what existed about the same period (2300 to 1000 years before Christ) among the inhabitants of Egypt, from which certain kinds of learning spread to Greece, from Greece to Rome, and from Rome over western Europe, including the British islands, and all other modern countries. By a clear line of descent, therefore, we trace the rudiments of modern civilisation to Egypt, a land which is deserving of our notice, not only on this account, but on that of its magnificent remains of ancient art, which till the present day astonish the mind of the traveller.

As thus interesting from their connection with modern civilisation, or with our religion, we offer sketches of the history of Egypt, Palestine, Greece, and Rome, with some account of these countries, confining ourselves in the present instance to Egypt.

EGYPT—ITS HISTORY.

In point of local situation, Egypt possesses various advantages.* It lies in the north-east corner of Africa, in a salubrious part of that vast continent, presenting its northern base to the Mediterranean Sea, and bounded on the east by the Red Sea, which separates it from Asia. Through the whole land from north to south, a length of 900 miles, flows the Nile, a fine large stream rising in the inland kingdom of Abyssinia, and, from certain periodic floods, of great use in irrigating and fertilising the country. A large portion of Egypt consists of an alluvial plain, similar to our fertile meadow grounds, formed by the deposits of the river, and bounded by ranges of mountains on either side. The greatest breadth of the land is 150 miles, but generally it is much less, the mountain ranges on either side often being not more than five to ten miles from the river. Anciently this territory was divided into three principal parts—Upper Egypt, or Thebais (from Thebes, its capital city), which was in the inner or southern part; Middle Egypt; and Lower Egypt, which included what was called the Delta, a low district of land on the shores of the Mediterranean, formed by the mouths of the Nile into the shape of the Greek letter Δ, or delta.

The history of the people who at one time inhabited this remarkable country is carried by their annalists to the very earliest ages; indeed, to a period far more remote than that ascribed by Moses to the creation of the world. When divested of fable, it appears that Egyptian monarchy was established by Menes, or Mizraim, in the year of the world 1816, and that it continued till the year 3479, when it was destroyed by Cambyses, *King of Persia*. To Misraim succeeded a line of sovereigns of great power and fame, every one of whom seems to have delighted in edifices of extraordinary magnitude and splendour. Extensive and beautiful cities, obelisks, pyramids, temples, were erected without regard to the resources of the people; and as their remains exist this day extant, and have been described by travellers, we are impressed with the most significant tokens of taste and knowledge of the ancient Egyptians. Also each of the Egyptian monarchs was distinguished by his own peculiar name—as Moeris, Rameses, Sesostris, Pheron, Cheops, &c.—those who reigned for a considerable period, in Lower Egypt especially, were designated Pharaoh, a title commonly used in Scripture to express the Egyptian rulers at the time. The Pharaoh who was noted for his oppression of the Israelites, who flourished 1577 years before the Christian era, and properly called Rameses Miamum, while his successor Pharaoh under whose reign the Children of Israel departed out of Egypt, and who was drowned in the Red Sea, was entitled Amenophis.

The country thus governed, by a course of circumstances unknown to the present age, and which will likely ever remain hid from our understanding, was among the first on the face of the earth which exhibited any demonstrations of refinement in taste. The kingdom (says Rollin) bestowed its noblest labour on the finest arts on the improving of mankind; and Egypt was so sensible of this, that its most illustrious men, as Homer, Pythagoras, Plato, even its great legislators, Lycurgus and Solon, with many more—travelled into Egypt to complete their studies, and draw from that fountain whatever was most rare and valuable in every kind of learning. God himself has given this land a glorious testimony, when, praising Moses, he says of him, that 'he was learned in all the wisdom of the Egyptians.'" Such was the desire for encouraging the pursuits of scientific pursuits, that discoverers of any useful invention received rewards suitable to their skill and labour. They studied natural history, geometry, and astronomy, and, what is worthy of remark, they were so far masters of the latter science as to be able to fix the period required for the earth's annual revolution, and fixed the year at 365 days 6 hours—a period which remained unaltered till the very recent change of style. They likewise studied and improved the science of physic, in which they attained a certain proficiency. The persevering ingenuity and industry of the Egyptians are attested by the remains of their great skill of art, which could not well be surpassed in modern times; and although their working classes were obliged to engage in the occupations of their fathers, as in others, as is still the custom in India, society was thereby be hampered, but the practice of handicraft would be certainly improved. The Egyptians were also among the first people who were acquainted with the processes of communicating information by means of writing, or engraving on stone and metal; and consequently, the first who formed books and established libraries. These repositories of learning they guarded with scrupulous care, and the titles they bore must have inspired a desire to enter them. They were called "Office for the Diseases of the Soul," and that justly, because the soul was there cured of ignorance, which, it will be allowed, is the source of many more maladies of our mental faculties. As these repositories of the learning of the ancient Egyptians were destroyed, and are only known from the records of historians, the works of their sages and poets cannot now be shown; and it is by little else than the inscriptions on stones, found amidst the ruins of pyramids and temples, that we are so much as aware of the nature of the characters employed in their writing. These characters were exceedingly curious, consisting chiefly of representations of animate and inanimate objects, each of which stood for some particular idea. The use of emblematic figures seems to have been, as it is still common among uncultivated races of men, be the first approach towards literature; but the use

* *Egypt is called Mazr by the natives.*

alphabet, by which words are formed by combinations of different characters, was in early times confined entirely to the Egyptians, from whom the invention was communicated across the Mediterranean to Greece, by a person of celebrity called Cadmus, and from thence spread into other European nations. It is also understood that the Israelites, and other Asiatics, received their knowledge of letters from the learned inhabitants of Egypt. The use of rude emblematic figures was not abandoned by the Egyptians as letters became known, but continued chiefly to denote matters of a mysterious or religious tendency. These figures have received the name of *hieroglyphics*, and are of various kinds, more or less significant of the thing or idea intended to be expressed. For thousands of years the world remained in total ignorance of the manner of deciphering these hieroglyphics, for the Egyptians left no clue whereby to make the discovery; and it was only in 1814 that, by the researches of some Frenchmen, a key to certain kinds was made known. It was found that, although the figures often signify the thing which they represent—for instance, the figure of a lion signifying that animal—yet that in many instances it does no such thing, but stands simply for the letter L, which is the initial letter in the word *lion*. The discovery of this mode of deciphering the Egyptian hieroglyphics, by reckoning only the initial letters in the names of the things represented, lays open a wide field for the investigation of learned and inquisitive travellers in the ancient territory of the Pharaohs.

The comparative intelligence of the Egyptians did not rescue them from the most debasing superstitions in their religious faith. They had a great number of ideal gods; among others, Osiris and Isis, which are thought to have been the sun and the moon. They also worshipped a number of beasts, as the ox or bull (under the name of Apis), the dog, the wolf, the hawk, the crocodile, the ibis or stork, the cat, &c.; and such was the reverence which they paid to these animals, that, in extreme famine, they chose to eat one another rather than feed on their imagined deities. The Egyptians had a belief, inculcated by their priests, that the souls of men, after death, passed into the bodies of clean or unclean animals, according to the deeds done in the body, and that at a distant period of time they returned to the body to which they originally belonged. A doctrine so extravagant led their kings to build enormous architectural edifices for the reception of their bodies, in order that they might, as they thought, repose in safety till they were again to be endowed with a living soul. In this fantastic notion we find a satisfactory solution of the mysterious practice of inhuming mummies in those huge pyramids, now reckoned among the greatest wonders in the world.

In the days of Egypt's ancient glory, it was dignified with two greater and many lesser cities. The two principal were Thebes, the capital of Upper Egypt, and a city of extraordinary extent and splendour; and Memphis, the capital of the middle district of the country. Memphis was built on the west side of the Nile, and has been succeeded by the comparatively modern city of Cairo, on the east bank of the river. On the site of Thebes and Memphis, and in their neighbourhood, are now found the greatest quantity of the ruins of ancient temples and other magnificent erections. In the present day Thebes receives the name of Said.

Like all other distinguished nations of antiquity, Egypt, after a lengthened period of extensive civil power, military glory, and dignified learning, suffered a series of reverses of fortune, and finally sank into a state of utter poverty and barbaric ignorance. The proximate causes of this disastrous event were the political distractions of the country, and the rise of a greater power in the vicinity—that of Nebuchadnezzar, king of Babylon. But in this, as in every other instance of national ruin in ancient times, the principal causes of the disaster were the ill-balanced condition of society, and the general ignorance of the people; the nation did not possess the elements of stability, and became an easy prey to a more powerful and savage neighbour. The country was overrun by Nebuchadnezzar and his hosts, 569 years before Christ, when an immense quantity of its moveable wealth was carried off. About forty-four years afterwards, Egypt was again intruded upon by force of arms, and fell a prey to the conquering hordes of Persia under Cyrus, when many of its edifices were destroyed. It now became a distant colony of Persia, which maintained an authority over it for more than 200 years, at the end of which it was seized by Alexander the Great, a monarch of Greece, who shortly afterwards conquered the whole of Persia. Besides settling the government of the country, Alexander improved it in various ways—among the rest of his enterprises, building the city of Alexandria, which he called after his own name; and as it was placed on the seacoast, at one of the mouths of the Nile, it speedily rose to be one of the largest and most opulent sea-port towns in the world. Upon the division of the Persian empire some time later, Egypt fell to Ptolemy Lagus, one of Alexander's generals, who was succeeded by a race of princes distinguished by the name of Ptolemy, in addition to their other appellations; and hence the Ptolemies of Egypt who are spoken of in ancient history. The last royal descendant of this noble Grecian line was Cleopatra, a princess of great beauty and accomplishments; and at her decease, which she accomplished by suicide, the land of Egypt became a province of Rome, some of whose emperors endeavoured to revive in it a love of letters, and enriched it by various improvements. Subsequently, Egypt fell into a state of ruinous distraction, consequent on the troubles and decline of the Roman government, and was at last completely subdued by the Saracens, who introduced the religion of Mahomed, destroyed the libraries, and, as far as possible, the splendid works of art; so that, under their sway, every species of barbaric rudeness was made to supersede the ancient refined habits of the people. Since that dismal epoch, Egypt has, century after century, sunk deeper and deeper into a state of perfect neglect and ruin. In recent times it has been under the immediate rule of Mehemet Ali, nominally a pacha of the Sultan of Constantinople, and by whom, with considerable suffering to the poor inhabitants, certain improvements have been effected.

DESCRIPTION OF THE COUNTRY.

As already mentioned, Egypt consists of the long flat valley of the Nile, from Abyssinia on the south, to the shore of the Mediterranean Sea, and nominally consists of three divisions, the Delta or lower region, Middle, and Upper Egypt. It is said to contain 200,000 square miles, but only about 16,000 of these are susceptible of cultivation. In ancient times, the country was more generally fertile than in the present day, owing to the encroachment of the sands of the adjacent deserts, and the long period of desolation and mismanagement in which it has existed. Still, owing to the inundations, the lands are more than usually productive, and yield crops of wheat, barley, rice, millet, maize, flax, beans, cotton, tobacco, the sugar-cane, and other useful vegetables. Of fruits, the citron, lemon, pomegranate, apricot, banana or plantain, and the palm-date, flourish luxuriantly. The palm is cultivated to a large extent in the inundated and irrigated lands, and groves of it, yielding a delightful shade, are to be seen, consisting of several thousand trees. Another celebrated production of Egypt is the lotus, a species of water-lily, of great beauty, exhibiting broad round leaves, amid which the flowers, in the form of cups, of bright white and azure, expand on the surface of the waters. The roots of vegetables were used as food by the ancient Egyptians. There is also the papyrus, not less celebrated than the lotus, and which furnished a material used as paper, before the invention of that article; it is, like the lotus, an aquatic plant, growing to the height of eight or ten feet amid the swamps of the Nile. The filaments of the plant being separated and cemented together in pieces, formed sheets whereon writing was executed. (See article PAPER-MAKING.)

THE NILE.

The most remarkable natural object in Egypt is the Nile, which periodically overflows its low banks, and inundates the greater part of the country. The Nile is formed by the union of two streams in the upper country, the Bahr-el-Abiad (white river), and the Bahr-el-Azrek (blue river), in lat. 15° 40′ north. The former, rising in Abyssinia, to the south-west of lake Dembea, comes from the south-east, and was considered by Bruce as the Nile. The latter, however, which comes from the south-west, and is supposed to rise in the Mountains of the Moon, in the centre of Africa, brings down the greatest mass of water, and is considered as the true Nile. In lat. 17° 40′ it receives the Tacazze from the east; enters Egypt in 24°, following nearly a northern course; and below Cairo (30° 15′ north) divides into the two main arms, as we have already mentioned. There were anciently reckoned seven principal mouths, by which its waters were poured into the Mediterranean; only those of Damietta and Rosetta are at present navigable; the others have been choked up. The distance from the confluence of its two head branches to the sea, is about 1500 miles; from its highest sources probably not far from 2500 miles. At certain points in its course, the Nile falls over a series of cataracts, or, properly speaking, descends a series of tumultuous rapids, for the fall is nowhere above two feet of sheer descent. The cataracts are not altogether a bar to navigation, as vessels which sail up the river may be drawn up by an extraordinary force. There are parties of Arabs who make a business of hauling boats up the cataracts. The Nile has also numerous islands in its course.

The grand phenomenon connected with the Nile, is its annual overflow of the banks which border it—an event looked for with as much certainty as the daily rising of the sun. These inundations of the Nile are owing to the periodical rains which fall between the tropics. They begin in March, but have no effect upon the river until three months later. Towards the end of June it begins to rise, and continues rising at the rate of about four inches a-day, until the end of September, when it falls for about the same period of time. Herodotus, the Grecian historian, informs us, that in his time a rise of sixteen cubits was sufficient to water the country. At present, twenty-two cubits are considered a good rise. The towns are generally built in such a situation and manner as not to be overflowed by the inundation, and in some parts of the country there are long raised causeways upon which the people may travel during the floods. It is only in cases of an extraordinary rise that any villages are destroyed. The inundations, instead of being viewed as a calamity, are considered a blessing, for they are the cause of inexhaustible fertility. After the waters have subsided, the earth is found covered with mud, which has been left there by the river. This mud, which is principally composed of argillaceous earth and carbonate of lime, serves to fertilise the overflowed land, and is used for manure for such places as are not sufficiently saturated by the river; it is also formed into bricks, and various vessels for domestic use. The whole valley of the Nile may be considered as an alluvial plain formed of the washed-down mud and sand of central Africa, and it is therefore to these inundations that Egypt owes its existence. The accumulation of soil has been estimated at about forty feet within the last four thousand years.

In Upper and Middle Egypt, there are immense numbers of canals on the left bank of the river. Mehemet Ali, the present pacha, has opened many of the old canals, which had been closed for centuries, and dug new ones; among the latter, the canal of Mahmoud, connecting the harbour of Alexandria with the Nile, near Fouah, forty-eight miles long, ninety broad, and eighteen deep, is a magnificent work. The Delta is bordered by a number of maritime lakes or lagoons, which at different periods have undergone considerable changes; some of them had been dried up, when, from various causes, their connection with the ocean, had been interrupted, was again resumed, and exhausted basins replenished with water. In ancient Egyptian mythology, the Nile was revered the tutelary deity of the country. His attribut the crocodile, the sphinx, the hippopotamus, a dolphin.

It might be supposed that in consequence annual inundations, Egypt would be a wet or country; but the very reverse is the case. The are speedily dried up and carried off as vapours winds, leaving the climate so remarkably dry tha in the open air will not putrify, but be dried or shr up. Rain, snow, thunder, or any of the commo spheric phenomena, are seldom or never seen or In consequence of the dry arid heat during mo of the year, hot winds from the sandy deserts, mode of living of the people, ophthalmia, or dis the eyes, is common, and many of the inhabita blind of one or both eyes. The principal winds over the country are from the north, and are o use in tempering the atmosphere and wafting up the Nile against the current.

To the above account of the Nile, we add the ing pleasing sketch by Mr Bowring, as given interesting small work for youth, entitled 'Morals:"—"Among the Egyptians, the attachm less to the soil than to the river—the river Nile is in their eyes, as it was in the eyes of their fore a sort of divinity. They speak of their Nile w intensity of personal affection—it is their dail factor; to it they owe their wealth great or sm verdure of their fields, their food, their drink clothing—for it produces the vegetables and they eat; it gives the water with which they their thirst and cook their victuals; it causes th tree to grow of which they make their garm supplies their flocks and herds. There is not a on its banks who, from the time at which she is fi to carry a pitcher on her head or bear one in he does not daily replenish it in the sacred and ve stream. Its praise passes into proverbs, into the talk. I remember travelling to the Bahr el Yer and having alighted, I gave my horse to a poor woman; when, on remounting, I put a small coin hand, she said, 'May Allah bless thee as he bles course of the Nile!' A hundred times I had beer Egypt, 'You will return hither. No one ever dr waters of the Nile without being irresistibly imp drink them again.' And the water, though not delicious and healthful. The Egyptian Levantin a saying, that 'What champagne is to other wine Nile to other waters;' and there is also an proverb—'Had Mahomet drunk the waters of th he would have staid on earth, and not have himself to be conveyed to Paradise.' * * * are between 5000 and 6000 boats constantly in ment on the two branches of the Nile, the Rose Damietta branches; and from the point of their up to Assouan. There is the first cataract, called—but it is not a cataract; it is merely a where the waters rush through the granite having, however, channels so large, that during months of the year the boats can be hauled th and proceed to Wadi Halfa, the second cataract boats are of all sizes, from the smallest *pont* to which will convey 200 tons of goods. They are most part of coarse construction, carrying one large triangular sails, and are frequently overtu the sudden gusts on the river."

The district of country west from the banks river is ordinarily called the Libyan desert or d and that on the east the Arabian.

INHABITANTS.

The population of Egypt is composed of an extraordinary mixture of races, and of all shades of colour; some claiming to be descendants of the ancient Egyptians, though utterly degenerated, others being from Arabian or Saracenic intruders, and so on to the number of a dozen distant races, also a variety of mixtures to whom no name can be assigned. The following is the common enumeration:—1. The race called Copts, the supposed descendants of the ancient Egyptians, and more certainly the feeble remnant of a once numerous Christian population. 2. The Fellahs, who compose the bulk of the labouring class, and who are supposed to be a mixture of ancient Egyptians, Arabians, and Syrians; they are rigid Moslems. 3. The Bedouin Arabs, the same in character, manners, and customs that they are every where, and apparently ever have been since the days of the patriarchs, regarding with disdain and proud independence all other classes of mankind, but more especially those of their own nation who have degraded themselves by taking up their abodes within walls. 4. Arabian Greeks, that is, the descendants of ancient Greek colonists, who have lost their ancient language, and speak a kind of Arabic. Many of them are mariners, but, in general, they pursue the inferior and handicraft trades. 5. Jews. To these must be added, as inhabitants of Egypt, 6. Syrian-Greeks and Maronites, who have, within the last century, greatly increased in numbers, and have proved successful rivals of the Copts and Jews as merchants and agents. 7. Armenians. 8. Turks. 9. Franks or Europeans. 10. Mamelukes. 11. Moggrebins, or Western Arabs. 12. Ethiopians and other Africans. The following is as near an approximation as can be obtained of the relative numbers of the different divisions of this motley crew:—Copts 150,000; Arab Fellahs 2,250,000; Bedouin Arabs 150,000; Arabian Greeks 25,000; Jews 20,000; Syrians 20,000; Armenians 10,000; Turks and Albanians 20,000; Franks 4000; Mamelukes 500; Ethiopians, &c. 7500; which amount in all to 2,667,000. Since this list was made up, the Mamelukes, a race of foreign mercenary soldiers, have been extinguished. As being dangerous to the state, or rather opposed to the introduction of European customs, they were utterly destroyed by order of Mehemet Ali.

The Arabs have been divided into three classes:—First, the wild independent Bedouins who occupy the desert; second, the pastoral tribes, who feed their flocks upon the borders of Egypt, and occasionally enter the cultivated provinces; and lastly, the peasants or Fellahs, who are devoted to agriculture and the arts. The latter, who form the bulk of the population, are described as a fine race of men in their persons, active in agricultural employments, and possessed of many good qualities. In their dress and household economy in general, though not strangers to comfort, they are so to every thing like luxury. Their food is very plain, and none but the higher orders, or those of dissolute lives, ever taste wine. The Arabs carry on the common trades of civilised life, but in a very unskilful and imperfect manner. We shall have occasion afterwards to speak of the general state of trade and manufactures in Egypt.

The Arabs have seldom more than two wives; in general only one. The women for the most part can neither read nor write; but the better sorts are taught embroidery and ornamental needlework, in which they mostly pass their time. The features of the Arab-Egyptian women are by no means regular. They are taller in general than our European women. Their hair is black and long, their skin of a disagreeable mulatto colour, and they stain various parts of their body with colouring matter. The tented Arabs still maintain their ancient character of proud independence, and in manners and customs are the same people they were 3000 years ago.

After enumerating the various oriental races who

inhabit Egypt, it need hardly be mentioned that Mahommedanism is the prevailing religion. Generally speaking, those who profess Christianity know nothing of its doctrines or moral precepts, the practice of their faith being confined to a few unmeaning ceremonies, and the repetition of a few established phrases. The whole people, high and low, are in a state of intellectual darkness; in the towns there exists, among Jews, Franks, and Turks, a degree of comfort and some wealth, but in the country parts many of the inhabitants are in a state of deplorable wretchedness; and in some places they are seen almost entirely naked, having neither regular food nor clothing, and no lodging except in holes or mud-built hovels. When they have any thing to take, they are ground to the earth by taxation, and both body and goods are at the mercy of their despotic ruler and his inferior functionaries.

ALEXANDRIA.

On reaching the shores of Egypt from the sea, the first place usually touched at by the traveller is Alexandria, the capital of Lower Egypt, or the Delta. It is situated on a low flat part of the coast, at some distance west from one of the main branches of the Nile. The two main branches of the river are to the east of Alexandria—the first in this direction being that on which is placed Rosetta or El Raschid, and that still farther east being that on which Damietta is situated. Between Alexandria and Rosetta is Aboukir Bay.

The Alexandria (or Iskandria) of the present day, is very different from its predecessor, founded by Alexander the Great, and destined by him to be the centre of his empire, and the commerce of the world. According to Pliny, it was fifteen miles in circuit, and contained a population of 300,000 individuals. It shone in all the pomp of architectural magnificence, and contained streets of immense breadth, which intersected it from end to end. Its public edifices were of the most splendid description, and its library contained 400,000 volumes, including all the Greek and Latin literature, of which we now only possess fragments. This treasure has been irreparably lost to the world. An order of Theodosius the Great, that all the heathen temples throughout the Roman empire should be overthrown, was the cause of it. A crowd of fanatical Christians stormed and destroyed the temple of Jupiter Serapis, where the library was, and the volumes were either burned or dispersed, and, like the lost tribes of the Jews, they have never been found. When Alexandria succumbed to the caliph Omar, it contained 4000 palaces, 4000 baths, 400 theatres or public edifices, and 12,000 shops, and a population which may be estimated by its including 40,000 Jews. Its appearance now is most melancholy and wretched, resembling, at a distance, according to one traveller, with its ruins grey, and flat-roofed houses, a town newly laid desolate by an enemy. The streets are narrow, dirty, and irregular, and usually crowded with "half-fed, half-clad" human beings. The climate of the place is also materially altered. From having been once salubrious, it is now very unhealthy. "Still Alexandria," says Sir Robert Wilson, "must be pronounced the key of Egypt, although insulated by water and desert from the surrounding country, since in its harbour alone security can be found for shipping of any burden throughout the year." The modern town does not occupy the site of the old one, which lies to the south, and presents an immense field of confused ruins. Over a space of from six to seven miles in circuit, is spread an assemblage of broken columns, obelisks, and shapeless masses of architecture, which are interspersed with some more modern buildings, such as churches, mosques, and monasteries. Amid this scene of widespread devastation, a few objects rise conspicuous, the most remarkable of which is "Pompey's Pillar;" it is *about ninety* feet high, and consists of a pedestal, *very fine shaft, and a Corinthian* capital, each being *formed of one entire piece of granite.* Vulgar belief ascribes the erection of this pillar to Cæsar, memoration of his triumph over Pompey, is now generally considered as erroneous. T plausible conjecture is, that it was reared by a of Egypt, named Pompey, in honour of the Diocletian. The next remarkable objects are obelisks vulgarly called Cleopatra's Needles, o ing erect, and the other laid prostrate. They posed each of a single block of granite, nea feet high, and entirely covered with hiero This circumstance indicates an Egyptian origi is conjectured that they were conveyed thith Memphis. The ancient canal between Cairo a andria has lately been restored by Mehemet the commerce of the place by this means gre proved.

In other respects, Alexandria is beginning t some marks of renovation. Mr Stephens, traveller,* observes—"I contemplated the i ments: a whole street of shops, kept by Eu and filled with European goods, ranges of fine h fine country-houses, and gardens growing upo sands, showed that strangers from a once b land were repaying the debt which the world the mother of arts, and raising her from the which she had been plunged by years of mis anarchy." The pacha has here his arsen barracks for his army, also his fleet when not employment; and he has endeavoured to cer a commerce that was formerly divided betwee places. Alexandria is further likely to be i from being an intermediate station for the ne intercourse betwixt England and India by wa isthmus of Suez and the Red Sea, from wh about eighty miles distant. The Nile, a short w Rosetta, when reached from Alexandria, is d by Mr Stephens as being worthy of its histo "I found it (says he) more than a mile w current at that season (December) full and the banks on each side clothed with a beautiful and groves of palm-trees—the most striking in African scenery—and the village of Fo stopping-place for boats coming up from Ro Damietta, with its mosques, and minarets, and domes, and groves of palms, forming a pic object in the view."

ROUTE OF THE NILE—CAIRO.

Egypt, as has been said, must be viewed sin strath or valley of a few miles in width, with Nile flowing through it; it is at least only on t of the river that the wonderful objects of an are seen, which excite the admiration of tr Pursuing the course of the river above the po separation into two main branches, these rema first into view on approaching Cairo, at the 30t of north latitude. Here the river consists of on ful broad stream, on the east or right bank of wh Cairo; and also on a very narrow branch, on or left bank, the famed Pyramids of Gizeh are The site of these structures is generally elevat the level of the plain, and stretches as a rocky for about fifty miles parallel with the river. Kahira, is not close upon the Nile, but stan distance of about a mile from it, at the bas rocky heights of Mokattam, and the large Boulac, on the river, is its harbour or port; he wise, are various manufacturing and other e ments, including a printing-office under the au the pacha. As in the case of Alexandria, the Cairo is very different from the ancient city name, erected by the caliphs in the middle age a walled town, built in a picturesque eastern st is the seat of the court of Mehemet Ali, whose are very extensive. The population of Cairo to about 240,000, but with that of the environs it to half a million.

* Incidents of Travel in Egypt, Arabia Petræa, and Land—"People's Edition," W. and R. Chambers.

Mahomet Ali, and all Europeans, in whatever country, are perfectly safe from insult or injury. Old Cairo, the original town near this spot, and called by the Arabs Masr-el-Atekah, is a suburb at the distance of a mile on the banks of the river, the intervening space being laid out in gardens and plantations. It contains most of the population, which is now partially settled, and quite a place of temporary summer resort for the citizens of Cairo, is believed to be as old as the days of the Israelites in Egypt, and a house in it is shown as that in which the Virgin Mary lodged after she had fled into the country from Palestine. The whole town is said to have been erected in the year 750, at the Saracenic conquest, and called El Kahira, the victory. In the year 1175, it was visited by Saladin, who surrounded it with a wall for defence.

"Mr Stephens's account of his approach to Cairo, in going up from Alexandria, conveys a striking idea of the appearance of the city and its environs:—'Towards the evening of the fourth day, we came in sight of the world's great wonder,' the colossal pyramids, standing at the head of a long reach of the river directly in front of us, and almost darkening the horizon. The sun was descending in that cloudless sky known only in Egypt; a few moments their lofty summits were lighted by a gleam of burnished red; and as the glorious orb settled behind the mountains of the Libyan Desert, the atmosphere became dark and more indistinct, and their outline continued to be seen after the whole earth was shrouded in gloom. The next morning at seven o'clock we were alongside the Island of Rhoda, as the Arabs name it, where the daughter of Pharaoh came down to bathe, and found the little Moses. We went over in a small boat to Boulac, the harbour of Cairo, breakfasted with Mr T——, the brother-in-law of my friend, an engineer in the pacha's service, whose interesting wife is the only English lady there; and, mounting a donkey, in half an hour I was within the walls of Grand Cairo. The traveller who goes there with the reminiscences of Arabian tales hanging about him, will nowhere see the Cairo of the caliphs; but when arriving there he will have seen a curious and striking spectacle. He will have seen, streaming from the gate among loaded camels and dromedaries, the lordly Turk, with his glittering sabre, the wily Greek, the grave Armenian, and the despised Jew, with their long pelisses, their turbans, solemn beards, and various and striking costumes; he will have seen the harem of some rich Turk, eight or ten women on horseback, completely enveloped in large black silk wrappers, entirely hiding face and person, and preceded by that monstrous of the East, a black eunuch; the miserable Copt, the Arab saint, with a few scanty rags on his head and shoulders, the rest of his body perfectly naked; the wealthy Bedouin of the desert, the haughty Emir, with a cocked gun in his hand, dashing furiously through the crowd, and perhaps bearing some hasty mandate of his royal master; and perhaps he will have seen and blushed for his own image in the person of some beggarly Italian refugee. Entering the gate, guarded by Arab soldiers in a bastard European uniform, he will cross a large square filled with officers and soldiers, surrounded by what are called palaces, but being nothing that can interest him save the house in which the gallant Kleber, the hero of many a bloody field, died ingloriously by the hands of an assassin. Passing this square, he will plunge into the narrow streets of Cairo. Winding his doubtful and perilous way among tottering and ruined houses, jostled by camels, dromedaries, horses, and donkeys, perhaps he will draw up against a wall, and, thinking of plague, hold his breath, and screw himself *into nothing, while he*

the delight of the imagination, greatest among the great, whose splendour and opulence made the prophet smile?'

One of my first rambles in Cairo was to the slave-market. It is situated nearly in the centre of the city, as it appeared to me, although, after turning half a dozen corners in the narrow streets of a Turkish city, I will defy a man to tell where he is exactly. It is a large old building, enclosing a hollow square, with chambers all around, both above and below. There were probably 500 or 600 slaves, sitting on mats in groups of ten, twenty, or thirty, each belonging to a different proprietor. Most of them were entirely naked; though some, whose shivering forms evinced that even there they felt the want of their native burning sun, were covered with blankets. They were mostly from Dongola and Sennaar; but some were Abyssinians, with yellow complexions, fine eyes and teeth, and decidedly handsome. The Nubians were very dark, but with oval, regularly formed and handsome faces, mild and amiable expressions, and no mark of the African except the colour of their skin. The worst spectacle in the bazaar was that of several lots of sick, who were separated from the rest, and arranged on mats by themselves; their bodies thin and shrunken, their chins resting upon their knees, their long lank arms hanging helplessly by their sides, their faces haggard, their eyes fixed with a painful vacancy, and altogether presenting the image of man in his most abject condition. Musing them as their native sands, their crouching attitudes, elongated jaws, and rolling eyes, might have led one to mistake them for those hideous animals the orang-outang and ape. Prices vary from twenty to a hundred dollars; but the sick, as carrying within them the seeds of probable death, are easily offered for almost nothing, as so much damaged merchandise which the seller is anxious to dispose of before it becomes utterly worthless on his hands. There was one, an Abyssinian, who had mind as well as beauty in her face; she was dressed in silk, and wore ornaments of gold and shells, and called me as I passed, and peeped from behind a curtain, smiling and coquetting, and wept and pouted when I went away; and she thrust out her tongue to show me that she was not like those I had just been looking at, but that her young blood ran pure and healthy in her veins.

Cairo is surrounded by a wall; the sands of the desert approach it on every side, and every gate, except that of Boulac, opens on a sandy waste. Passing out by the Victory Gate, the contrast between light and darkness is not greater than between the crowded streets and the stillness of the desert, separated from them only by a wall. Immediately without commences the great burial-place of the city. Among thousands and tens of thousands of Mussulmans' headstones, I searched in vain for the tomb of the lamented Burckhardt; there is no mark to distinguish the grave of the enterprising traveller from that of an Arabian camel-driver. At a short distance from the gate are the tombs of the caliphs, large and beautiful buildings, monuments of the taste and skill of the Saracens. From hence, passing around outside the walls, I entered by the gate of the Citadel, where I saw what goes by the name of Joseph's Well, perhaps better known as the Well of Saladin. It is 45 feet wide at the mouth, and cut 270 feet deep through the solid rock, to a spring of salt water, on a level with the Nile, whence the water is raised in buckets on a wheel, turned by a buffalo."

PYRAMIDS OF GIZEH.

"Almost from the gates of Cairo (continues this writer) the pyramids are constantly in sight, and after crossing the ferry, we rode towards them. Approaching, the

three great pyramids and one small one are in view, towering higher and higher above the plain. I thought I was just upon them, and that I could almost touch them; yet I was more than a mile distant. The nearer I approached, the more their gigantic dimensions grew upon me, until, when I actually reached them, rode up to the first layer of stones, and saw how very small I was, and looked up their sloping sides to the lofty summits, they seemed to have grown to the size of mountains. The base of the great pyramid of Cheops is about 800 feet square, covering a surface of about eleven acres, according to the best measurement, and 461 feet high [being 117 feet higher than St Paul's at London]. Even as I walked around it, and looked up at it from the base, I did not feel its immensity until I commenced ascending; then, having climbed some distance up, when I stopped to breathe and look down upon my friend below, who was dwindled into insect size, and up at the great distance between me and the summit, then I realised in all their force the huge dimensions of this giant work. It took me twenty minutes to mount to the summit; about the same time that it had required to mount the cones of Ætna and Vesuvius. The ascent is not particularly difficult, at least with the assistance of the Arabs. There are 206 tiers of stone, from one to four feet in height, each two or three feet smaller than the one below, making what are called the steps. Very often the steps were so high that I could not reach them with my feet. Indeed, for the most part, I was obliged to climb with my knees, deriving great assistance from the step which one Arab made for me with his knee, and the helping hand of another above.

It is not what it once was to go to the pyramids. They have become regular lions for the multitudes of travellers; but still, common as the journey has become, no man can stand on the top of the great pyramid of Cheops, and look out upon the dark mountains of Mokattam bordering the Arabian desert; upon the ancient city of the Pharaohs, its domes, its mosques and minarets, glittering in the light of a vertical sun; upon the rich valley of the Nile, and the 'river of Egypt' rolling at his feet; the grand range of pyramids and tombs extending along the edge of the desert to the ruined city of Memphis, and the boundless and eternal sands of Africa, without considering that moment an epoch not to be forgotten. Thousands of years roll through his mind, and thought recalls the men who built them, their mysterious uses, the poets, historians, philosophers, and warriors, who have gazed upon them with wonder like his own."

On the summit is an area, about thirty feet square, consisting of six square blocks of stone irregularly disposed. Six millions of tons of stones are supposed to have been employed in the construction of the pyramid, and 100,000 men for twenty years are said to have been engaged in the erection of this the most stupendous mass of masonry in the world. The four angles of the pyramid correspond with the four points of the compass. The mass of the pyramid is not altogether solid. An entrance has been made, by which a series of labyrinthine passages and chambers have been discovered. "The entrance (says Stephens) is on the north side. The sands of the desert have encroached upon it, and, with the fallen stones and rubbish, have buried it to the sixteenth step. Climbing over this rubbish, the entrance is reached, a narrow passage three and a half feet square, lined with broad blocks of polished granite, descending in the interior at an angle of twenty-seven degrees for about ninety two feet; then the passage turns to the right, and winds upwards to a steep ascent of eight or nine feet, and then falls into the natural passage, which is five feet high and one hundred feet long, forming a continued ascent to a sort of landing-place; in a small recess of this is the orifice or shaft called the well. Moving onward through a long passage, the explorer comes to what is called the Queen's chamber, seventeen feet long, fourteen wide, and eighteen high. *I entered a hole opening* from this crypt, *on my hands and knees*, came to a larger opening, not a regular chamber, and now cumbered with fallen stones. Immediately above this, ascending by an inclined plane lined with highly polished granite, and about 120 feet in length, and mounting a short space by means of holes cut in the sides, I entered the King's Chamber, about thirty-seven feet long, seventeen feet wide, and twenty feet high. The walls of the chamber are of red granite, highly polished, each stone reaching from the floor to the ceiling; and the ceiling is formed of nine large slabs of polished granite, extending from wall to wall. It is not the least interesting part of a visit to the interior of the pyramids, as you are groping your way after your Arab guide, to feel your hand running along the sides of an enormous shaft, smooth and polished as the finest marble, and to see by the light of the flaring torch chambers of red granite from the Cataracts of the Nile, the immense blocks standing around and above you, smooth and beautifully polished in places, where, if our notions of the pyramids be true, they were intended but for few mortal eyes. At one end of the chamber stands a sarcophagus, also of red granite; its length is seven feet six inches, depth three and a half, breadth three feet three inches. Here is supposed to have slept one of the great rulers of the earth, the king of the then greatest kingdom of the world, the proud mortal for whom this mighty structure was raised. Where is he now? Even his dry bones are gone, torn away by rude hands, and scattered by the winds of heaven. The interior of the pyramid is excessively hot, particularly when surrounded by a number of Arabs and flaring torches." To this account it may be added, that there is a well in the pyramid which is referred to by the Roman historian Pliny, as being eighty-six cubits in depth. It has been descended by a few enterprising travellers.

In one of the chambers of the great pyramid the annexed figure with hieroglyphics has been discovered; the hieroglyphics signify the word "Seamphis," the name of the builder, as it is believed, who lived about 2120 years before Christ.

To the celebrated Belzoni we are indebted for a knowledge of the interior of the pyramid of Cephrenes, brother and successor of Cheops; but any detail of his labours would carry us far beyond our limits. Suffice it to say, that they were directed with remarkable skill, and a perseverance which no obstruction could arrest. It stands upon a rather higher elevation than that of Cheops, and is built of the same species of limestone, and joined with the same kind of cement. Its base is 684 feet, and its height 456. The steps are much splintered and broken, but it can be ascended to a certain extent on the southern side without great difficulty. The opening of this pyramid presents to us a striking instance of discrimination and tact. Herodotus had declared that it contained no chambers, and modern travellers had taken this report for granted. The practised eye of Belzoni, however, detected certain indications of an entrance, and, after many days of labour upon the hard stone, he found himself at last in a chamber hewn out of the solid rock, from the floor to the roof, which last is of the same stone as the pyramid itself. In the sarcophagus were the bones of an animal, very generally supposed to be those of a sacred bull, an object of veneration among the ancient Egyptians. On the wall at the west end of the chamber he per-

ceived an Arabic inscription, from which it has been inferred that the two larger pyramids had been explored, at the distance of many years, by some of the caliphs. The third large pyramid is that of Mycerinus; but it is much less, and not so important an object as the others. There is also a fourth large pyramid, although travellers are in the habit of speaking of the pyramids of Gizeh as only three in number. Those of Sakhara appear to be a continuation of the great cemetery to which those of Gizeh belong. Two of them only are very large, and they are all more dilapidated than those we have described; hence, a higher antiquity has been ascribed to them. With regard to the other Egyptian pyramids, they are, in their leading characters, nearly similar to those described, and the end for which they were constructed we infer was the same—that of receptacles for the dead, and chiefly for the bodies of kings and other royal personages. Some maintain that they were consecrated to the sun, others that they were used for astronomical observations, others for transmitting historical information, and so on.

Numerous ruined edifices and tumuli lie scattered about among the pyramids, and extend north and south along the left bank of the Nile as far as the eye can reach. The stone buildings supposed to be mausoleums, are generally of an oblong form, having their walls slightly inclined from the perpendicular inwards, the peculiar characteristic of ancient Egyptian architecture; flat-roofed, with a sort of parapet round the outside, formed of stones; rounded at the top, and rising about a foot above the level of the terrace. The walls are constructed of large masses of stone, of irregular shape. The various chambers of these edifices were found to be profusely embellished with sculptures and bas-relief paintings, many of which were spirited and beautiful. In one of them were found the remains of several mummies, and in another the fragments of a figure as large as life. An important circumstance remains to be noticed. In each of these edifices there was discovered a well, from the bottom of which a passage led to a subterranean chamber. Caviglia cleared out one of these shafts, which was sixty feet deep; and in the chamber he found a plain but highly finished sarcophagus, nearly of similar dimensions with that in the pyramid of Cheops. This supplies a strong argument in favour of the hypothesis that the pyramids are tombs.

By far the most brilliant of Mr Caviglia's discoveries, are those to which he was led in the laborious task of uncovering the great sphinx in front of the pyramid of Cephrenes. On the stone platform on the foreground, and centrally between the outstretched paws of the sphinx, was discovered a large block of granite, which fronted the east, and was highly embellished with sculpture in bas-relief. Two other tablets of calcareous stone, similarly ornamented, were supposed, with that of granite, to have constituted part of a temple, by being placed one on each side of the latter, and at right angles to it. One of them in fact was still remaining in its place. Of the other, which was thrown down and broken, the fragments are now in the British Museum. A small lion couchant, in front of this edifice, had its eyes directed towards the sphinx. There were, besides, several fragments of other lions, rudely carved, and the fore part of a sphinx, of tolerable workmanship. In front of the temple was a granite altar, with one of the four "horns" still retaining its place at the angle. From the effects of fire evident on the stone, this altar, it would seem, had been used for burnt-offerings. Inscriptions were found upon the digits of the paws, but of no moment.

Like every thing else in Egypt, this singular monument has been the subject of very opposite representation. The general accuracy of Dr Richardson induces us to lay his account of it before the reader. "The breast, shoulders, and neck, which are those of a human being, remain uncovered; as also the back, which is that of a lion. The neck is very much eroded, and, to a person near the head, seems as if it were too heavy for its support. The head-dress has the appearance of an old-fashioned wig, projecting out about the ears like the hair of the Berberi Arabs; the ears project considerably; the nose is broken; the whole face has been painted red, which is the colour assigned to the ancient inhabitants of Egypt, and to all the deities of the country except Osiris. The features are Nubian, or what from ancient representation may be called ancient Egyptian, which is quite different from the negro feature. The expression is particularly placid and benign, so much so that the worshipper of the sphinx might hold up his god as superior to all the other gods of wood and stone which the blinded nations worshipped." As to the dimensions of the sphinx, the stretch of the back is about 120 feet, and from the top of the head to the base of the reclining figure about 40 feet. Such has been the drifting of the sands, that the whole figure is now covered, except the head and a portion of the dilapidated neck, as seen in the annexed cut. The French uncovered a part of the figure, but the sands have again drifted it up.

A few miles above the pyramids of Gizeh once stood Memphis, a city as large and flourishing as Alexandria, but now utterly destroyed, and the very ruins hardly distinguishable.

DISTRICT ABOVE CAIRO.

Pursuing the course of the Nile upwards, and passing various villages and ruined structures, the first place of importance which occurs is Beni Soueff, situated on the left bank in one of the richest and most extensive tracts of corn land in Egypt, at the distance of 114 miles above Cairo. Penetrating a pass of the sylvan chain of mountains, at about fifteen miles west-south-west of this town, we enter the district of Fayoum. Medinet-el-Fayoum, the capital, is situated in lat. 29° 20′ north, long. 31° 1′ 30″ east, built from the materials, and partly on the site, of the ancient Crocodilopolis, the name of which was changed to Arsinöe, by Ptolemy Philadelphus, in honour of his sister. It contains about 5000 inhabitants, chiefly Moslems, with the usual proportion of mosques and baths. A canal from the Bahr Yousuf divides it into two parts, which are connected by five bridges. The principal remains of the ancient city lie to the north of the present town, occupying an area nearly two miles and a half from north to south, and two miles from east to west. Amongst the ruins are numerous fragments of statues, obelisks, &c. The town of Arsinöe was one of the most celebrated in Egypt, and so late as the time of the Romans contained a flourishing population. Fayoum is still reckoned the most productive part of Egypt, and all the country as far as Lake Mœris is well cultivated. This celebrated lake was of artificial formation in ancient times, and extended to several hundreds of miles in circumference. It was connected by canals with the Nile. Continuing the route up the Nile, at the distance of about seventy miles we arrive on the same or western bank, at a considerable village called Al Rairamoun, where Ali Pacha has established a sugar manufactory and a distillery. In the environs

are extensive sugar plantations, and there is a saltpetre manufactory in the neighbourhood. About six miles to the south-west of this place are the remains of Hermopolis, an ancient town, whose representative is a large village called Oshmunein. About a league to the south of it is the large and well-built town of Mellane; and ten leagues farther on, and near the western shore, that of Manfaloot, anciently a place of great trade. It is a sort of capital, and the see of a Coptic bishop. The adjacent country is very fertile, particularly in fruits. About two leagues farther up, on the eastern side of the river, are several pits, in which are deposited the mummies of crocodiles. But we have now entered the Said, or Upper Egypt, which properly begins with Manfaloot, which is a sort of frontier town on the left bank. The valley of the Nile is in this part about eight miles from mountain to mountain, and, above Manfaloot, a cultivated place, commences on the eastern side of the river. For many miles the left bank of the river is perforated with excavations, which, however, have not been explored.

DENDERA.

Proceeding upwards beyond Manfaloot, we pass in the distance of eighty or ninety miles various towns of less or more importance; among others, Siout and Girzah on the left, and the ruins of Ekhim on the right bank. On the face of a range of mountains near Siout, is a long range of tombs, the burial-place of ancient Egyptians, excavated as chambers in the solid rock, and still ornamented in their ceilings with coloured paintings of old date, and which, like other remains of art, have been preserved by the extreme dryness of the climate. These, and all other objects, however, are of inferior interest to those which begin to be disclosed on approaching a bend of the river near the 26th degree of north latitude. Here the view opens of the magnificent ruins of the temple of Dendera, and some miles farther on those of Thebes.

The ruins of Dendera are more than a mile in length, and half a mile in breadth. The grand object of interest is the temple, a very celebrated ruin, which, if cleared from rubbish, would present a front of 160 feet, with a height of 60 feet. The principal propylon—or, as we might call it, the gateway of the approach—is a truly magnificent object, forming a tall block of columnar architecture, covered with the most exquisite sculpture and hieroglyphics. The sculptured figures on the dilapidated walls of the temple bendings are equally beautiful. Some idea of the grandeur of these ruins may be gathered from the circumstance recorded of the French army during its campaign in Egypt. When the soldiers first beheld the ruins, they were so overpowered with their gigantic size and extraordinary beauty, that they exclaimed, as with the heart and voice of one man, such a sight more than repaid them for all the sufferings and dangers of the war. It is supposed to have been consecrated to the worship of Isis, who was the principal deity in the Egyptian Pantheon. The temple itself still retains all its original magnificence. Time has only rendered it more venerable and imposing in appearance.

THEBES.

Thebes, once the capital of Upper Egypt, and the most splendid city in the world, no longer exists; its site can now only be traced in four petty villages, Luxor, Karnac, Medinet Abou, and Gornoo, on both banks of the river—distance from the sea 650 miles. Thebes is famous as "the city of a hundred gates," the theme and admiration of ancient poets and historians, the wonder of travellers—"that venerable city," as Pocock eloquently remarks, "the date of whose destruction is older than the foundation of other cities, and the extent of whose ruins, and the immensity of whose colossal fragments, still offer so many astonishing objects, that one is riveted to the spot, unable to decide whither to direct the step or fix the attention." These ruins extend about eight miles along the Nile, from each bank to the sides of the enclosing mountain, and describe a circuit of twenty-seven miles. The most remarkable objects on the eastern side are the temples of Karnac and Luxor; and on the western are the Memnonium, or palace of Memnon, two colossal statues, the sepulchres of the kings, and the temple of Medinet Abou. Almost the whole extent of eight miles along the river is covered with magnificent portals, obelisks decorated with the most beautiful sculpture, forests of columns, and long avenues of colossal statues. The largest of these temples, and of any in Egypt, is that at Karnac, on the site of the ancient Diospolis.

With respect to the magnificence and beauty of its several parts, this temple has been pronounced as having no parallel in the whole world. It has twelve principal entrances, each of which is composed of several propyla and colossal gateways, besides other buildings attached to them, in themselves larger than most other temples. The sides of some of these are equal to the bases of the greater number of the pyramids in Middle Egypt. One of the propyla is entirely of granite, adorned with the most finished hieroglyphics, and many of them have been furnished with colossal statues. The avenues of sphinxes that lead in several directions to the propyla, one of which was continued the whole way across the plain to the temple at Luxor, nearly two miles distant, correspond to the magnificence of the principal structure; and the body of the temple, which is preceded by a large court, consists of a prodigious hall or portico, the roof of which is supported by 134 columns, some 26, others 34 feet in circumference; four beautiful obelisks mark the entrance to the shrine, which consists of three apartments, built entirely of granite. The dimensions of this great edifice are about 1200 feet in length, and 420 in width. But the principal fane, grand and imposing as it is, sinks into nothing when compared with the extent and number of the buildings which surround it; the prodigious gateways of polished granite, covered with sculpture, and adorned with colossal statues; the subordinate temples which any where else would be esteemed magnificent piles; and the avenues, which approach it from almost every point of the compass, miles in length, and guarded by rows of sphinxes of vast size, cut out of single blocks of syenite. The field of ruins at Karnac is about a mile in diameter. Probably the whole of the space was once, in the prouder days of Thebes, consecrated entirely to the use of the temple.

About a mile and a quarter above Karnac, are the village and temple of Luxor. This temple, though not of such vast dimensions as that of Karnac, is in a superior style of architecture, and in more complete preservation. The entrance is thought to surpass every thing else that Egypt presents, and the two obelisks are considered the finest in the world. But the objects which most attract attention are the sculptures which cover the east wing of the northern front. They contain, on a great scale, a representation of a victory gained by one of the ancient kings of Egypt over their Asiatic enemies. The number of human figures introduced amounts to 1500—500 on foot, and 1000 in chariots.

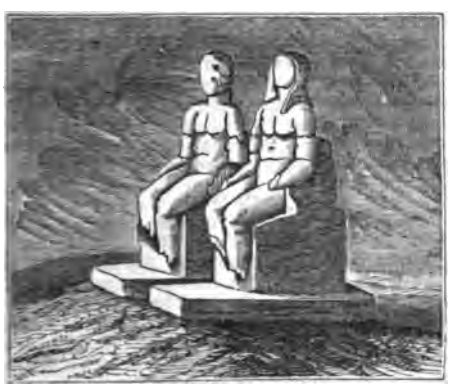
The disposition of the figures, and the execution of the whole picture, are equally remarkable, and far surpass all preconceived ideas of the state of art at the remote era to which we must attribute them. After passing several gateways, we enter what is conjectured to be the palace of the great Osymandyas. These ruins of Luxor and Karnac represent only one-half of ancient Thebes. The temples of Medinet Abou are also splendid, and upon a grand scale. It was so placed as to be exactly opposite to that of Luxor, on the other side of the Nile, while the magnificent structure at Karnac was fronted by the Memnonium or temple of Dair; and hence all these grand objects formed so many stages or prominent points in the religious processions of the priests. Though the tabernacle of Jupiter dwelt at Karnac, the proper Diospolis, yet it was carried over

the river every year, and remained a few days in Libya; and we find, from a general estimate, that there was a space of between nine and ten miles over which they might exhibit the pomp and parade of their superstition, both going and returning. Almost every part of the road through this immense theatre was lined with sphinxes, statues, propyla, and other objects calculated to inflame the ardour of devotion.

The Memnonium deserves particular notice. This celebrated relic of antiquity, the palace of king Memnon, or of the Pharaohs, faces the east, and is fronted with a stupendous propylon, of which 234 feet of its length are still remaining.

Every stone in the propylon appears to have been shaken and loosened, as if from the concussion of an earthquake. The passages which conduct to the chambers are so broken and filled up, as hardly to admit of examination. The walls are in various parts ornamented with sculptures, and other pictorial devices. One of the most striking is a battle scene. The various situations of victors and vanquished are represented in a very lively manner, and the whole sculpture, though but roughly executed, is full of fire. In the Memnonium there is still to be seen the statue of Osymandyas, or Sesostris, which is allowed to be the finest relic of art which the place contains, although shattered and broken. It is about twenty-six feet broad between the shoulders, fifty-four feet round the chest, and thirteen feet from the shoulder to the elbow. There are on the back hieroglyphical tablets, extremely well executed, which identify this enormous statue with the hero whose achievements were sculptured on the walls of the temple.

The above figure has sometimes been confounded with that of Memnon, so long celebrated for its vocal qualities. The latter, however, is one of the two statues



usually called Shamy and Damy, which stand at a little distance from Medinet Abou, in the direction of the Nile. These, we are told, are about fifty-two feet in height. They rest on thrones, which are respectively thirty feet long, eighteen broad, and between seven and eight high. They are placed about forty feet asunder, are in a line with each other, and look towards the east, directly opposite to the temple of Luxor. The southern one appears to be of one entire stone. The face, arms, and front of the body, have suffered so much, that not a feature of the countenance remains. The head-dress is beautifully wrought, as also the shoulders, which, with the back, are uninjured. The massy hair projects from behind the ears like that of the sphinx. The sides of the throne are highly ornamented with elegant devices. The colossus is in a sitting posture, with the hands resting upon the knees.

The gigantic statue which is placed on the north side, would appear, from various circumstances, to be that of the vocal Memnon, who was said to play a lively strain when the sun rose, and a melancholy one when he set. It presents the same attitude as its companion. These statues are placed on either side of an avenue leading to a place of worship, and evidently were followed by a series of other colossal figures, as the remains of some of them are still visible.

"The rambler among the ruins of Thebes (observes Mr Stephens) will often ask himself, 'Where are the palaces of the kings, and princes, and people, who worshipped in these mighty temples?' With the devout spirit of religion that possessed the Egyptians, they seem to have paid but little regard to their earthly habitations; their temples and their tombs were the principal objects that engrossed the thoughts of this extraordinary people. It has been well said of them that they regarded the habitations of the living merely as temporary resting-places, while the tombs were regarded as permanent and eternal mansions; and while not a vestige of a habitation is to be seen, the tombs remain monuments of splendour and magnificence, perhaps even more wonderful than the ruins of their temples. The whole mountain-side on the western bank of the river is one vast necropolis. The open doors of tombs are seen in long ranges, and at different elevations, and on the plain large pits have been opened, in which have been found 1000 mummies at a time. For many years, and until a late order of the pacha preventing it, the Arabs have been in the habit of rifling the tombs to sell the mummies to travellers. Thousands have been torn from the places where pious hands had laid them, and the bones meet the traveller at every step. The Arabs use the mummy-cases for firewood, the bituminous matters used in the embalmment being well adapted to ignition; and the epicurean traveller may cook his breakfast with the coffin of a king. Notwithstanding the depredations that have been committed, the mummies that have been taken away and scattered all over the world, those that have been burnt, and others that now remain in fragments around the tombs, the numbers yet undisturbed are no doubt infinitely greater; for the practice of embalming is known to have existed from the earliest periods recorded in the history of Egypt; and by a rough computation, founded upon the age, the population of the city, and the average duration of human life, it is supposed that there are from 8,000,000 to 10,000,000 of mummied bodies in the vast necropolis of Thebes.

Amid the wrecks of former greatness which tower above the plain of Thebes, the inhabitants who now hover around the site of the ancient city are perhaps the most miserable in Egypt. On one side of the river they build their mud huts around the ruins of the temples, and on the other their best habitations are in the tombs; wherever a small space has been cleared out, the inhabitants crawl in, with their dogs, goats, sheep, women, and children; and the Arab is passing rich who has for his sleeping place the sarcophagus of an ancient Egyptian."

Mr Stephens, in the above quotation, inquires, "Where are the residences of the kings, princes, and people of ancient Egypt?" These are entirely gone. They were built of brick, and have long since been utterly destroyed, or buried in fragments beneath the drifting sands of the desert, or the accumulations from the Nile. The temples and pyramids having been erected of a stupendous size and of a solid material, have survived, while all the ordinary habitations of the people have disappeared.

EDFOU, ELEPHANTINA, PHILOE.

The magnificent ruins of Thebes are not by any means the last object of interest in ascending the river. Passing Esneh, a town on the left bank, and an emporium of the trade with Abyssinia, we reach on the same side of the river, at about the distance of fifty miles from Thebes, the town of Edfou, composed as usual of a parcel of mud houses, bazaars, and a mosque. "At one corner of this miserable place (says Mr Stephens) stands one of the magnificent temples of the Nile. The propylon, its lofty proportions enlarged by the light of the moon, was the most grand and imposing portal I saw in Egypt. From a base of nearly 100 feet in length and 30 in

breadth, it rises on each side the gate in the form of a truncated pyramid, to the height of 100 feet, gradually narrowing, till at the top it measures 75 feet in length and 18 in breadth. Judge, then, what was the temple to which this formed merely the entrance; and this was far from being one of the large temples of Egypt.

It measured, however, 440 feet in length and 220 in breadth, about equal to the whole space occupied by St Paul's Churchyard. Its dromos, pronaos, columns, and capitals, all correspond, and enclosing it is a high wall, still in a state of perfect preservation. I walked round it twice, and, by means of the wall erected to exclude the unhallowed gaze of the stranger, I looked down upon the interior of the temple. Built by the Egyptians for the highest uses to which a building could be dedicated, for the worship of their gods, it is now used by the pacha as a granary and storehouse."

Fifty miles farther up we reach the boundary of Egypt and Nubia, at the town of Assouan or Syene. It is situated in lat. 24° 5′ 23″ north, long. 32° 54′ 49″ east. Its natural position, so well adapted for a frontier town, has rendered it at all times a place of importance. It was formerly a bishopric, but no Christians are now found here. Ruined churches and convents strike the eye of the traveller, but the Christian faith is unknown. Not only is it the last town in Egypt, but it is the last place in this direction in which the Arabic is spoken as the vernacular tongue. Here occurs the first Egyptian cataract in descending the Nile.

The present town of Assouan has been built a little to the north of a former town of Saracenic origin, the ruins of which are seen above it, and which was itself built upon the ruins of a Roman city. The whole town is encompassed with vestiges of buildings; the most interesting are about the old town, which occupies a strong and commanding position: the walls still remain, and though slight and of sun-dried brick, are very entire. They are flanked with towers at unequal distances. Many of the walls of the houses are also standing, but they are all unroofed. From the interior of many of them, passages lead down to the chambers of houses belonging to the ancient city, which are now under ground; of the old town a few insignificant ruins are all the remains.

Below the cataracts at this place occurs the small island of Elephantina, or, as it is called by the Arabs, Djeziret-zel-zabir, the flowery island; it is about 2000 feet in length, and 600 feet in breadth. The northern end is low and alluvial, well cultivated, and shaded with palm-trees. Here are the ruins of Roman fortifications, opposite to which, on the eastern bank of the Nile, are remains of Arabian works. There is an ancient quarry, from which large columns have been excavated; the marks of the workman's chisel and wedge are as fresh as if they were of yesterday. Some are lying blocked out partly wrought, and a large sarcophagus is two-thirds cut out of the rock. There are a number of architectural remains, sculptures, and hieroglyphical tablets. This beautiful island is inhabited by Nubians, who are perfectly black, without having any resemblance in their features to the negro.

Above the cataracts, at the distance of about six miles south from Assouan, is the far more interesting though smaller island of Philöe, or Djeziret-el-birba, meaning the Temple island. "This island is entirely covered with temples in large groups, and in a high state of preservation; and from a rocky eminence at its southern extremity the whole of the ruins may be seen at once. On the south-west side are two large temples, adorned and connected by long colonnades, but manifestly of different ages; on the right is the small Temple of Isis, with an isolated unfinished building, having no remains of the cella, nor any appearance of an interior cornice; and on the left are an obelisk, and long porticoes leading to a large temple of Isis, near a smaller one dedicated to Hatbod or the Egyptian Venus, which Champolion has pronounced the best in the island. The great Temple of Isis, which is the southernmost of all, has two colossal pyramidal propyla. None of the existing monuments of Egypt is better calculated to convey an adequate idea of the magnificence by which they are characterised, than the portico of this temple, which consists of twelve columns, four in front and three deep. The capitals, which are in pure Egyptian taste, represent varied forms and compositions of the palm branch, the domm leaf, and the lotus. These, as well as the sculptures on the columns, the ceiling, and the walls, have been painted in the most vivid colours, which still retain much of their original brightness. At the northern extremity of the island there are the remains of a triumphal arch, and other works of Roman architecture; and on the north-east side an unfinished temple, exhibiting many peculiarities of structure, and showing that the arts were not always stationary in Egypt. In a word, within the compass of this little island, Nubian cabins, Arab huts, Christian chapels, Roman fortifications, and Egyptian temples, are crowded together in such a manner as to produce a painful sense of the lapse of ages, the transitory nature of empires, and the destructibility of human works, however colossal in magnitude or solid in construction."*

ETHIOPIA.

Few travellers proceed farther up the Nile than Philöe, as the journey through Nubia is less safe or agreeable than that within the Egyptian territory. Yet without a visit to the Nubian valley of the Nile, which extends to near the head branches of the river in Abyssinia, much of the ancient grandeur of this part of the world will remain unexplored. Nubia, which is at present a Turkish province subject to the pacha of Egypt, is frequently called by the name Ethiopia, from the black complexion of whose inhabitants the term Ethiopian came in early times to signify one who is black, or a negro. This country of Nubia, or Ethiopia, is understood by some historians to have enjoyed a degree of civilisation and refinement in art, at a date even earlier than Egypt; and till the present day it possesses pyramids and other monuments of architectural skill, as wonderful, in the eyes of the traveller, as those in the lower divisions of the Nile.

One of the latest travellers who penetrated to this inner Ethiopian region, was Mr G. A. Hoskins, who in 1835 published a large volume descriptive of his journey. At about the 17th degree of north latitude, he reached Meroe, an island formed by the forking of two upper branches of the Nile. This island is between three and four hundred miles long, and contains several distinct groups of pyramidal structures of extraordinary magnificence, but greatly damaged by the hand of barbarians; also some traces of the remains of the city of Meroe, once the capital of Ethiopia. "Never (says Mr Hoskins) were my feelings more ardently excited than in approaching, after so tedious a journey, to this

* Encyclopædia Britannica, article Egypt.

magnificent necropolis. The appearance of the pyramids, in the distance, announced their importance; but I was gratified beyond my most sanguine expectations when I found myself in the midst of them. The pyramids of Gizeh are magnificent, wonderful from their stupendous magnitude; but for picturesque effect and elegance of architectural design, I infinitely prefer those of Meroe. I expected to find few such remains here, and certainly nothing so imposing, so interesting, as these sepulchres, doubtless of the kings and queens of Ethiopia. I stood for some time lost in admiration. From every point of view I saw magnificent groups, pyramid rising behind pyramid, while the dilapidated state of many did not render them less interesting, though less beautiful as works of art. I easily restored them in my imagination; and these effects of the ravages of time carried back my thoughts to more distant ages. The porticoes on the east side of each pyramid soon attracted my attention, and I passed eagerly from one to the other, delighted to find in several of them monuments of sculpture and hieroglyphics, which, few as they are, have, I trust, given us the assurance of the locality, and will, I hope, throw some light upon the mythology and arts of the Ethiopians. There are the remains and traces of eighty of these pyramids; they consist chiefly of three groups. The principal and most imposing, at which I arrived first, is situated on a hill, two miles and a half from the river, commanding an extensive view of the plain. There are thirty-one pyramids in this group, of which the plans of twenty-three may be traced; while to the south-east is another group of thirteen, in some degree of preservation. There are three other groups, two consisting of two pyramids each, and the other of six; and at 5600 feet to the west of the chief group, may be traced the remains of twenty-five pyramids, but almost buried."

After mentioning the appearance and minor details of these remarkable structures, this author continues—"I have carefully described this interesting and magnificent cemetery; but how shall I attempt to express the feelings of the traveller on treading such hallowed ground? One who, in passionate admiration for the arts, had visited the chief galleries of Europe, gazed upon the breathing image of divinity in the Apollo of the Vatican, or the deep expression of the most poetical of statues, the Dying Gladiator of the Capitol; who had beheld and felt the pictorial creations of a Raphael and a Correggio, and, with delight, contemplated Grecian, Roman, and modern sculpture, could not be unmoved at finding himself on the site of the very metropolis where those arts had their origin. The traveller who has seen the architectural antiquities of Rome, and has admired the magnificent use that nation has made of the arch, making it the chief ornament of their baths, palaces, and temples, would be further deeply interested at finding here the origin of that discovery. These emotions would be felt with peculiar force by one who, like myself, had been fortunate enough to trace art through her earliest creations—from the splendid Gothic edifices of the north to the ruins of the eternal city—from Rome to Magna Græcia—from the magnificent temple of Neptune at Pæstum, to the still purer antiquities of Sicily, particularly at Girgenti, where nature and art seem to have vied with each other—from that interesting island to the Morea and the city of Minerva, where the knowledge of the arts, sown in the most genial soil, produced the perfection of elegance, chasteness, and magnificence. But the seeds of the knowledge of the Greeks were derived from Egypt; and the Egyptians received their civilisation from the Ethiopians, and from Meroe, where I now am writing. The beautiful sepulchres of that city afford satisfactory evidence of the correctness of the historical records. Where a taste for the arts had reached to such perfection, we may rest assured that other intellectual pursuits were not neglected, nor the sciences entirely unknown. Now, however, her schools are closed for ever, without a vestige of them remaining. Of the houses of her philosophers, not a stone rests upon another; and where civilisation and learning once reigned, ignorance and barbarism have reassumed the sway.

These pyramids are of sandstone, the quarries of which are in the range of hills to the east. The stone is rather softer than the Egyptian, which, added to the great antiquity, may account for the very dilapidated state of most of these ruins, and also for the sculpture and hieroglyphics being so defaced. Time, and the burning rays of a tropical sun, have given them a brownish red tint, in some parts nearly black. As the operation of many ages is required to make this change on a light-coloured sandstone, a further proof is afforded of the great antiquity of the monuments. The stones being small, and easily removed, it is fortunate that the chief group of pyramids is so far distant from the Nile; otherwise, like those on the plain, near the river, a great proportion of them might have been carried away as materials for the erection of more modern edifices.

This, then, is the necropolis, or city of the dead. But where was Meroe, its temples and palaces? A large space, about 2000 feet in length, and the same distance from the river, strewed with burnt brick and with some fragments of walls, and stones similar to those used in the erection of the pyramids, formed, doubtless, part of that celebrated site. The idea that this is the exact situation of the city, is strengthened by the remark of Strabo, that the walls of the habitations were built of bricks. These indicate, without doubt, the site of that cradle of the arts which distinguish a civilised from a barbarous society. Of the birthplace of the arts and sciences, the wild natives of the adjacent villages have made a miserable burying place: of the city of the learned—'its cloud-capt towers,' its 'gorgeous palaces,' its 'solemn temples,' there is 'left not a rack behind.' The sepulchres alone of her departed kings have fulfilled their destination of surviving the habitations which their philosophy taught them to consider but as inns, and are now fast mouldering into dust. As at Memphis, scarcely a trace of a palace or a temple is to be seen. In this once populous plain, I saw the timid gazelles fearlessly pasturing. The hyænas and wolves abound in the neighbouring hills. This morning Signor B. met a man with the head of one which he was carrying in triumph to his village: he said that he had been attacked at once by three small ones when alone, and with no weapon but his lance. The small villages of Bagromeh, south of the ruins, consist of circular cottages with thatched conical roofs. The peasants have numerous flocks, which they send to pasture on the plain. On the banks of the river I observed cotton, dourah, and barley. Such is the present state of Meroe. It is an ample requital for my toilsome journey, to have been the first to bring to England accurate architectural drawings, &c., of all the remains of the ancient capital of Ethiopia, that city which will ever live in the grateful recollection of those who love the arts."*

Returning to Egypt, the description of the country may be concluded by a notice of those fertile districts in the desert at a distance from the Nile, and termed Oases.

THE OASES.

Oasis is a Coptic word signifying an inhabited place, and is usually applied to a fertile spot or island in the midst of a sandy desert. The Oases of Egypt are found at intervals in the middle of that vast plain of arid sand called the Libyan Desert. There are several of them, which are named, according to their size or situation, the Great, Little, Western, Northern, &c.

The Northern, or Oasis of Siwah.—This place, which is about 300 miles distant from Cairo, and about 100 from the Nile, is peculiarly interesting, from its being supposed to enclose the far-famed temple of Jupiter Ammon. The Oasis is about six miles long, and from four to five broad. It is pretty fertile, and contains

* Travels in Ethiopia, by G. A. Hoskins, Esq. 1 vol. 8vo. London, Longman & Company, 1835.

about 8000 inhabitants. The capital is called Siwah. Besides the splendid remains of the temple, supposed to be that of Jupiter Ammon, are the ruins of other sacred places, and a number of sepulchral excavations.

Great Oasis.—This Oasis is formed of a number of fertile isolated spots, which lie in a line parallel to the course of the Nile, and to the mountains which bound the valley of Egypt on the west. It is about two days' journey from the nearest part of the valley of the Nile. The patches of firm land are separated from one another by deserts of twelve or fourteen hours' walk—so that the whole extent of this Oasis is nearly 100 miles, the greater proportion consisting of a desert. It contains many gardens watered with rivulets, and its palm groves exhibit a perpetual verdure. According to a more recent account, it contains Egyptian ruins covered with hieroglyphic inscriptions. The principal town is called El-Kargeh. Here are the remains of a temple beautifully situated in the midst of a rich grove of palm trees. Near El-Kargeh, there is also a regular necropolis or cemetery, containing 200 or 300 buildings of unburned brick, chiefly of a square shape, and each surmounted by a dome similar to the small mosques erected over the graves of sheiks. At distances of a few miles, some other remains of ancient temples are found. This whole oasis has always been and still is dependent on Egypt. None of the other oases of the desert present us with any object worthy of being dwelt upon.

ANCIENT EGYPTIAN SOCIETY AND ART.

The discoveries which have been made in modern times by travellers (chiefly French, Italian, and English) in Egypt, although disclosing the remarkable remains of pyramids, temples, and tombs, which have been above adverted to, do not give any just idea of the grandeur and opulence of the ancient Egyptian dynasties. We learn from Josephus, Diodorus, Herodotus, and other historians, that at one time Egypt and the adjoining provinces under its sway contained 20,000 (some say 30,000) populous cities, and as many as 7,000,000 of inhabitants. At that early period (2300 to 1000 years before Christ) the country was also more fertile, and much less encroached upon by sandy deserts than it now is. Besides depending on its internal resources, it drew great wealth from the territories which it laid under contribution; but its chief source of revenue was in manufacturing industry and commerce. Its artisans excelled in all manner of handicraft employments, and its merchants conducted an export and import traffic on a most extensive scale; in short, Egypt was long the Great Britain of its day—the most industrious and wealthy nation in the world.

It is interesting to know what was the constitution of Egyptian society in these days of ancient glory. It was that of castes similar to what still exists in India. According to the best authorities, the first or chief caste was that of the priests, to whom the king necessarily belonged, as a species of pope or temporal head; the second was composed of the soldiers and agriculturists; the third of the artificers, tradesmen, merchants, builders, and professional men; and the fourth consisted of shepherds, fishermen, servants, and all other orders of common people. All the learning of a refined or metaphysical kind was confined to the order of priests, who were of various classes, each following its appointed duty; for example, each deity had its own order of priests, the judges and magistrates were also priests, as likewise were the sacred scribes, the officers who examined and set their seal on the sacrifices, the attirers of the statues of the gods, the keepers of the sacred robes, the doctors, the carriers of the sacred emblems in the processions, the bearers of the small statues, the preservers of the sacred animals, the sprinklers of water in the temples, the embalmers of bodies, the drivers away of flies from the countenances of the gods, and various other functionaries. Thus, the Egyptian priesthood, with the king at their head as a sort of deity, were a formidable body among the people, from the power with which they were invested and their number; and it need hardly be mentioned that they appropriated to themselves by far the largest share of all the good things with which the land abounded, or which the industry of the nation introduced from foreign countries. The enormous sums which must have been lavished by them in the erection of temples and palaces are beyond all calculation; and when we consider that this vast expenditure went towards the adoration of crocodiles, bulls, dogs, storks, snakes, and other animals, or at least of a tribe of gods whom these creatures were imagined to represent, we are overwhelmed with the magnitude of the superstition, and look upon the ancient Egyptians, with all their learning, as little advanced on the right road to civilisation.

A nation, however, as has been a thousand times proved, may have attained considerable proficiency in learning and the arts, and yet be affected by the most ridiculous superstitions. The Egyptians, as appears from hieroglyphics, paintings, and records of various kinds, were adepts at mechanical expedients, and possessed almost all the elegances of refined living which are now common in an improved form in Europe. In the construction of their pyramids and other large buildings, no degree of labour for any length of time seems to have intimidated them. The huge blocks of stone, sometimes weighing 1000 tons each, were dragged for hundreds of miles on sledges, and their transport, perhaps, did not occupy less time than a year; in one case which is known, 2000 men were employed three years in bringing a single stone from a quarry to the building in which it was to be placed. Usually, the sledges were drawn by men yoked in rows to separate ropes, all pulling at a ring fixed to the block. Where it was possible, the blocks were brought from the quarries on flat-bottomed boats on the Nile. But the transport of these large masses was much more easily accomplished than the placing of them in elevated situations in the buildings. They were raised by the power of levers and inclined planes at immense trouble and cost. One of the largest is the lintel over the doorway leading into the grand hall at Karnac; it measures 40 feet 10 inches long, and five feet square. It is understood that slaves or captives furnished a large share of the moving force in these undertakings; but besides these there were a variety of classes of workers, each carefully trained in the performance of his own particular duty; for instance, in dragging the blocks, there were employed slaves to pull, guards to watch, task-masters to regulate the operations, men with jars to throw water on the ground before the sledges, and, lastly, a person whose duty consisted in marking the time to the cadence of a song to ensure a simultaneous draught. This practice of shouting or singing to mark time during work, as still customary among sailors, is of extremely ancient date, being alluded to in the book of Jeremiah, xxv. 30:—"He shall give a shout as they that tread out the grapes."

The most extraordinary of the customs of this remarkable people was that of embalming their dead bodies with a view to perpetual preservation in the tomb. The business of embalming was very dignified, and was aided by a host of inferior functionaries who made and painted coffins and other articles which were required. The bodies of the poorer classes were merely dried with salt or natron, and wrapt up in coarse cloths, and deposited in the catacombs. The bodies of the rich and great underwent the most complicated operations, wrapped in bandages dipped in balsam, and laboriously adorned with all kinds of ornaments. Thus prepared, they were placed in highly-decorated cases or coffins, and then consigned to sarcophagi in the catacombs, or pyramids. Bodies so preserved have been called mummies, from the Arabian word *momia*, or the Coptic *mum*, signifying bitumen or wax. The quantity of mummies carried off in modern times to England, France, and indeed every European country, has been very considerable. The collection of them, and other Egyptian antiquities, in the British Museum, is very extensive.

MEHEMET ALI.—MODERN EGYPT.

Mehemet or Mahomet Ali, the modern reformer and pacha of Egypt, was born at Cavallo, in Roumelia, a part of European Turkey. His parents, who were of a humble condition of life, had a family of sixteen children, of whom he was the youngest; and being a greater favourite than his brothers and sisters, he in early life became accustomed to indulgences, and to be impatient of the control of superiors. His youth, it has been related, was partly spent in the service of a tobacconist; but leaving this employment, which was unsuitable to his genius, he entered the Turkish army as a common soldier, at a time when troops were raising in his native district. This was the sphere of life in which he was calculated to shine. Distinguishing himself as a soldier by his bold and skilful conduct, he soon attracted the attention of beys, pachas, and the sultan himself; and having attained a prominent position in the bloody wars that distracted Egypt under the Mamelukes, he rose to be Pacha, or Viceroy, of Egypt, one of the highest posts of honour in the whole Turkish empire. On getting the command of that province, he speedily showed that he was no ordinary man. He established a regularly paid, disciplined, and armed military force, on the European plan, instead of the irregular bands of men serving as soldiers in Egypt. The remnant of the Mamelukes, that remarkable body of men, which since the days of Saladin had practically governed Egypt by overawing the viceregal authority, he annihilated, and thus became the uncontrolled lord of the land of the Pharaohs, Ptolemies, Cæsars, and Caliphs. By the strictness of his government, he rendered Egypt as safe to travellers as any ordinary civilised country. Agriculture, commerce, manufactures, all engaged his attention; and though his reforms were accomplished with a despotic hand, perhaps with no small degree of cruelty, his conduct deserves our approbation. He may be crafty, cruel, and treacherous, still he has prodigiously advanced the cause of civilisation and improvement in Egypt, and opened the way for further and more important reforms.

Mehemet Ali has a family of several sons, the eldest of whom, Ibrahim Pacha, acts as commander-in-chief of his troops, and is understood to be of a less sagacious mind than his father. It is incontestible that Mehemet Ali has done much to further the advancement of civilisation in modern Egypt, but the whole of his efforts have at the same time tended to personal aggrandisement, and to the complete subjection of the people to his will. In order to maintain his authority, he raises troops from amongst the male population by the most tyrannical means; and so much is this forced military service detested, that great numbers of young men mutilate themselves, by destroying an eye or cutting off one or more fingers, in order to escape the conscription. Having been lately driven from Syria, with a prospect of being permanently confined to Egypt, it is likely that the pacha will relax the excessive military burdens of the people. In the meanwhile, his lust of conquest has led to the exaction of taxes to a degree altogether unheard of in any country laying claim to civilisation. "His revenue," says Mr Lane,* "is generally said to amount to about £3,000,000 sterling. Nearly half arises from the direct taxes on land, and from indirect exactions from the fellaheen (fellahs or agriculturists), the remainder principally from the custom-taxes, the tax on palm-trees, a kind of income tax, and the sale of various productions of the land [no one being permitted to export corn or cotton but himself]; by which sale, the government, in most instances, obtains a profit of more than fifty per cent. The present pacha has increased his revenue to this amount by the most oppressive measures. He has dispossessed of their lands all the private proprietors throughout his dominions, allotting to each, as a partial compensation, a pension for life proportioned to the extent and quality of the land which belonged to him. The farmer has, therefore, nothing to leave to his children but his hut, and perhaps a few cattle and some small savings.

The direct taxes on land are proportioned to the natural advantages of the soil. Their average amount is about 8s. per feddan, which is nearly equal to an English acre. But the cultivator can never calculate exactly the full amount of what the government will require of him: he suffers from indirect exactions of quantities (differing in different years, but always levied per feddan) of butter, honey, wax, wool, baskets of palm-leaves, ropes of the fibres of the palm-tree, and other commodities; he is also obliged to pay the hire of the camels which convey his grain to the government shooneh (or granary), and to defray various other expenses. A portion of the produce of his land is taken by the government, and sometimes the whole produce, at a fixed and fair price, which, however, in many parts of Egypt, is retained to make up for the debts of the insolvent peasants. The fellah, to supply the bare necessaries of life, is often obliged to steal, and convey secretly to his hut, as much as he can of the produce of his land. He may either himself supply the seed for his land, or obtain it as a loan from the government; but in the latter case he seldom obtains a sufficient quantity; a considerable portion being generally stolen by the persons through whose hands it passes before he receives it. It would be scarcely possible for them to suffer more, and live. It may be hardly necessary, therefore, to add, that few of the fellahs engage with assiduity in the labours of agriculture, unless compelled to do so by their superiors. The pacha has not only taken possession of the lands of the private proprietors, but he has also thrown into his treasury a considerable proportion of the incomes of religious and charitable institutions, deeming their accumulated wealth superfluous. He first imposed a tax (of nearly half the amount of the regular land-tax) upon all land which had become a *wuckf* (or legacy unalienable by law) to any mosque, fountain, public school, &c.; and afterwards took absolute possession of such lands, granting certain annuities in lieu of them, for keeping in repair the respective buildings, and for the maintenance of those persons attached to them, as nazirs (or wardens), religious ministers, inferior servants, students, and other pensioners." Mr Lane subsequently mentions, that sometimes the poverty of parents causes them to sell their children to any one who will purchase them, which presents a shocking idea of the degraded condition of the humble order of modern Egyptians.

In pursuing his schemes of improvement and family aggrandisement, Mehemet Ali acts as a despotic monopolist in all matters relating to both agriculture and commerce. He not only dictates what article of produce shall be cultivated, but the price at which it shall be sold. According to Dr Bowring, it appears that in 1834, the country produced about 500,000 quarters of wheat, 450,000 quarters of dourah, 400,000 of beans, 260,000 of barley, and 80,000 of maize. Of wheat, however, the produce sometimes rises to 1,000,000 of quarters. Dourah or Indian millet (*sorghum vulgare*) is used for bread by the fellahs or labourers. It is the same plant which is raised in the West Indies for food to the negroes, under the name of Guinea corn. Its price is 30 or 40 per cent. below that of wheat. The helbeh is a coarser seed, sometimes mixed with it. The average price of wheat is from 20s. to 27s. per quarter at Cairo, but in years of scarcity it rises to 60s. Egypt is generally an exporting country, but in 1837 it was forced to draw supplies from abroad. The cultivation of cotton was introduced by the pacha very recently, and succeeds well, the exports of this article in 1834 having been 200,000 cwts.; but as the government is the exclusive purchaser, and only gives what price it pleases, the fellahs would not raise it unless compelled by the despotic mandates of the pacha. He has endeavoured to

* Account of the Manners and Customs of the Modern Egyptians, 2 vols. 1836.

extend the cultivation of sugar, has introduced improved sugar-mills, and brought persons from the British colonies to distil rum. He has also invited Armenians from Smyrna and the East Indies, to teach his people how to cultivate opium and indigo, and prepare them for the market. There are about two millions of date trees in Egypt, each of which yields by its fruit from 8s. to 16s. per annum. A few attempts have been made to introduce the vine. Onions are still produced and consumed in prodigious quantities, as in the days of Herodotus. The pacha has established model farms, with improved ploughs, &c., but even his despotism cannot induce the people to abandon their ancient rude processes and implements.

The pacha is a great manufacturer. He has built large mills, and procured skilled workmen at a great expense from France, Italy, Germany, Belgium, and Britain, to conduct them. He has manufactories of cotton yarn and cotton cloth, woollens, carpets, ironware, muskets, cannon, bayonets, gunpowder, &c. All these establishments are believed to be attended with loss to his highness, and in some cases the loss is heavy. His spinning-mills for cotton are the most extensive of his manufactories. There are twenty-two of these, which, according to Dr Bowring, produce about 210,000 rottoli of yarn monthly, of various qualities, from coarse to "very fine." The Cairo rottoli is, we believe, just equal to the British pound, while the Alexandrian rather exceeds two pounds. The former, we suppose, is the weight alluded to in this instance; but as the cost of this yarn to the pacha is said to be only L.5270, we suspect there is some mistake in the statement. The men are paid fixed wages, generally about twopence per day, and they are punished with the lash for bad work or misconduct. The pacha has three manufactories of arms, which turn out 1600 muskets and bayonets per month. The largest one is managed by an Englishman, who has five other Englishmen and a number of Arabs under him.

All travellers represent Mehemet Ali as a person of plain and affable manners in private life, and fond of his family. Dr Bowring speaks of him as follows:—"Mehemet Ali was forty-six years old before he had learned either to read or to write. This he told me himself. I have heard that he was taught by his favourite wife. But he is fond of reading now; and one day, when I entered his divan unannounced, I found him quite alone, with his spectacles on, reading a Turkish volume, which he was much enjoying, while a considerable pile of books were by his side. 'It is a pleasant relief,' he said, 'from public business; I was reading some amusing Turkish stories' (probably the Arabian Nights); 'and now let us talk—what have you to tell me?' There is a great deal of sagacity in Mehemet Ali's conversation, particularly when he knows or discovers, as he usually does, the sort of information which his visitor is most able to give. He discourses with engineers about mechanical improvement—with military men on the art of war—with sea-officers on ship-building and naval manœuvres—with travellers on the countries they have visited—with politicians on public affairs. He very willingly talks of foreign countries, and princes and statesmen, and is in the habit of interlarding in the conversation short stories of anecdotes about himself, and the events connected with his history. His phrases are often poetical, and, like most Orientals, he frequently uses proverbs and imagery. I heard him once say, speaking of the acclimatisation of cotton in Egypt, 'When I came to this country, I only scratched the earth with a pin; I have now succeeded in cultivating it with a hoe; but soon I will have a plough passed over the whole land.'

Mehemet Ali's great pride is Ibrahim Pacha; a visit to whom is always the object of admiration among Mussulmans. And Ibrahim Pacha's existence is one of his father's military successes. His father's hand of iron in his bosom son and intended successor. 'I *know him*,' he said; 'I had not an unbounded *love for him*; I *fear him*; *many* years ago, not till he *was* [illegible] and, as I even changing its colour,' said the pacha to me; 'but now I thoroughly trust him.' On the part of Ibrahim there is always the utmost deference to Mehemet Ali. 'I have been very happy in my children,' Mehemet Ali said to me one day; 'there is not one of them who does not treat me with the utmost deference and respect.'"

Notwithstanding the improvements in education carried into effect by Mehemet Ali, the more opulent classes in modern Egypt are exceedingly ignorant. We learn from Mr Lane that "many of the tradesmen in Cairo can neither read nor write, or can only read what are obliged to have recourse to a friend to write their accounts, letters, &c.; but these persons generally cast accounts and make intricate calculations, mentally, with surprising rapidity and correctness." General learning is confined within very narrow limits. Very few persons "study medicine, chemistry, mathematics, or astronomy. The Egyptian medical and surgical practitioners are mostly barbers, miserably ignorant of the sciences which they profess, and unskilful in their practice, partly in consequence of their being prohibited by their religion from availing themselves of the advantage of dissecting human bodies. But a number of young men, natives of Egypt, are now receiving European instruction in medicine, anatomy, surgery, and other sciences, for the service of the government. Most of the Egyptians, in illness, neglect medical aid, placing their whole reliance on Providence or charms. Alchemy is more studied in this country than pure chemistry, and astrology more than astronomy. To say that the earth revolves round the sun, they consider almost heresy. Of geography, the Egyptians in general, with very few exceptions, the best instructed of whom, have scarcely any knowledge; having no maps, they are almost wholly ignorant of the relative situations of the several great countries of Europe. A few of the learned venture to assert that the earth is a globe, but they are opposed by a great majority of the Ulama. The common opinion of all classes of Moslems is, that the earth is an almost plane expanse surrounded by the ocean, which, they say, is encompassed by a chain of mountains called *Kaaf*." Notwithstanding the condition of general knowledge among the modern Egyptians, it does not surprise us to learn that they labour under the most ridiculous superstitions and believe in the powers of magic. Mr Lane observes of the people, among whom he lived for some years, that "their overreaching and deceitful disposition is evinced in their dealings by the manner in which they are ground under a rapacious and tyrannical system of government. By a singular contradiction in character, "they are remarkably honest in the payment of debts. Their prophet has declared, that martyrdom would not atone for a debt unsatisfied. Few of them ever accept interest for a loan of money, as it is strictly forbidden by their law."

Oppressed as modern Egypt is, it is gratifying to relate that it is improving in various respects in its condition. The pacha has introduced a number of intelligent Europeans into his military and civil service. Printing is now executed at Bulac, near Cairo, and presses have already produced more than a hundred different books in the Arabic language. For the use of military, naval, and civil servants of the government, A newspaper and an annual almanac are also regularly printed at Boulac. A considerable export and import trade is now carried on, the chief produce of the country being exchanged for the manufactured wares of cotton, silk, and other goods of Europe. The enormous material regeneration of Egypt is evinced by the regular arrival of steam-vessels at Alexandria from Marseilles, bringing hosts of European travellers and pleasure-seekers, reducing India by a journey from Cairo to Suez, and thence by steam-boats down the Red Sea to Bombay.

...E 6. NEW AND IMPROVED SERIES. PRICE 1½d.

HISTORY OF THE JEWS—HOLY LAND—ARABIA PETRÆA.

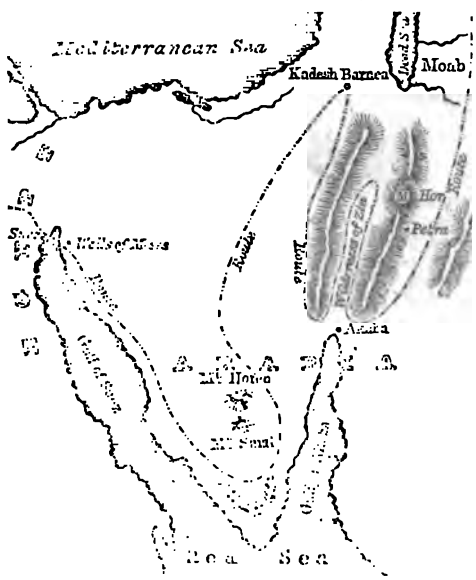
Treasury of Pharaoh—Petra.

Jews are the most ancient race of mankind of ... we possess any regular or authentic history, or ... existence as a distinct people can be clearly traced ... the primeval ages till the present day. According ... accounts given of them in Scripture, and in their ... by Josephus, they were descended from Abra... a native of Arabia, and the tenth in descent from ..., through his third son Shem. According to ...ius, Abraham, who was born in the two hundred ...ety-second year after the Deluge, "left the land ...aldea (the south-east of Arabia) when he was ...y-five years old, and at the command of God ... Canaan, and therein he dwelt himself, and ... to his posterity. He was a person of great saga... both for understanding of all things and persuad... hearers, and not mistaken in his opinions; for ... reason he began to have higher notions of virtue ... others had, and he determined to renew and to ... the opinion all men happened then to have con... God; for he was the first that ventured to publish this notion, that there was but one God, the Creator of the universe; and that as to other gods, if they contributed any thing to the happiness of men, that each of them afforded it only according to his appointment, and not by their own power. For which doctrines, when the Chaldeans and other people of Mesopotamia raised a tumult against him, he thought fit to leave that country, and at the command of God he came and lived in the land of Canaan. And when he was there settled, he built an altar, and performed a sacrifice to God." Abraham spent the chief part of the remainder of his life in Canaan and Palestine; and dying at the age of one hundred and seventy-five years, was buried in the tomb of his wife Sarah, in Hebron. At his death, he left one legitimate son Isaac, who had two sons, Esau and Jacob.

After the death of Isaac, his sons divided their inheritance, and Esau departing from Hebron, "left it to his brother, and dwelt in Seir, and ruled over Idumea." Jacob remained for a number of years in Canaan, surrounded by a family of twelve sons, one of whom, Joseph, as related in Scripture, became the cause of the removal of his father and brethren, and all belonging to them, into Egypt. The emigrants were seventy in number, and formed at the first a respectable colony among the Egyptians, who gave them the name of "Hebrews," or "foreigners." Jacob died after having been seventeen years in Egypt, and his body was carried by Joseph to Hebron, and buried in the sepulchre of his father and grandfather. Joseph also died in Egypt at the age of a hundred and ten, and at length his brethren died likewise. Each of the twelve sons of Jacob became the progenitor of a family or tribe, and the twelve tribes, personified by the term ISRAEL, continued to reside in Egypt, where they increased both in number and in wealth. Their rapid increase and prosperity soon excited the jealousy of the masters of the country; and from being in high favour, the different tribes gradually fell under the lash of power, and came to be treated as public slaves. The Egyptian rulers enjoined them to cut canals in connection with the Nile, to build walls and ramparts for cities, to make bricks, and to perform other laborious offices. "And four hundred years did they spend under these afflictions; for they strove one against the other which should get the mastery, the Egyptians desiring to destroy the Israelites by these labours, and the Israelites desiring to hold out to the end under them." From the description of their situation which is given in Genesis, and the affecting allusions to it afterwards in different passages of the Psalms, it appears that their tyrannical masters viewed them with the most unjustifiable hatred, contempt, and fear. Their sufferings were at last avenged by a direct interposition of Providence, which visited their oppressors with successive plagues, storm, vermin, and pestilence, till every living and growing thing in the land of Egypt was threatened with destruction, and the selfish rulers

of the country were at last constrained by terror to release their injured bondsmen.

The entire body of Israelites, guided by Moses, fled from Egypt in the year 1490 before Christ, at a time when Thebes, Memphis, and the other magnificent cities of that country, were in all their glory. Proceeding in a north-easterly direction from Rameses (near the site of modern Cairo), they went through the flat region of the land of Goshen (now a barren sandy plain) to the head of the Gulf of Suez, the western branch of the Red Sea. Here they crossed in a miraculous manner to the opposite shore, to a spot now called the Wells of Moses, where, according to the Scripture narrative, they sang their song of thanksgiving for their deliverance. The country in which they had now arrived was a portion of Arabia Petræa, consisting of a dismal barren wilderness, now called the desert of Sinai, from the principal mountain which rises within it. From the point at which the Israelites had crossed the Red Sea from Egypt, they were conducted by a most circuitous and tedious route towards the Promised Land of Canaan, once the residence of their fathers. Their route (see annexed map) lay along the eastern



border of the Gulf of Suez to a point beyond Mount Sinai; then, turning, they proceeded northward as far as Kadesh Barnea; from that they turned again southward to near the head of the Gulf of Akaba; again, they bent their way northward through the wilderness of Zin to Mount Hor, where Aaron was buried. Being at this point refused a passage through the country of the Idumeans or Edomites, they retreated along the path by which they had entered the desert vale; and lastly issued upon the plains near the Gulf of Akaba, and compassing on the south the land of Moab, arrived at Gilgal in the Promised Land.* This painful and tiresome journey extended over a period of forty years, and was not completed till all the Hebrews who were above twenty years of age when they left the land of Egypt (excepting Caleb and Joshua) had died, and a new generation possessing greater courage and confidence in the Almighty had succeeded them. In the trackless wilderness through which they were led, their multitudes, as we learn from Scripture, could neither have traced their way nor procured subsistence, without a continued miracle. The hand of God brought for them streams of water out of the flinty rock; rained manna or bread from heaven; and gave a pillar of cloud to direct their journeys through the day, and a pillar of fire by He delivered the tables of a moral law, comprehe the ten commandments, to Moses their leader gave out a set of regulations for the ceremor worship, the establishment of a separate order d to religion and learning, and for the civil governm the nation. They had thus a regular polity and v laws, when most other nations knew only the law sword, or of savage animal superiority.

The country on the shore of the Mediterr which was allotted as a settlement to this peopl at that time occupied by many warlike tribes had grown strong in its fertile plains and valleys the generation of the Hebrews who were con into it were compelled to fight for its possession. struggle was not of long continuance. The arr the Ammonites and Canaanites were defeated on another in rapid succession; and the alarm whi deterred their fathers from making the attack, w transferred to their enemies, who feared it. T Israelites had said in the desert, "We are in ou sight as grasshoppers before these sons of Anak the Lord brought us out of the land of Egypt to the sword of this people?" But the new gene had a firmer confidence in the help which was pr them; and it was now the turn of their foes to s "insomuch that their hearts melted, neither wa spirit in them any more, because of the child Israel." The land was conquered in the year before Christ.

According to the account given in the 26th c of the book of Numbers, the Hebrew nation thus b out of the land of Egypt and settled in Canaan, amo to 601,730 souls, unto whom the land was divid an inheritance, according to the number of individ the respective tribes. The tribes, and their fi men above twenty years of age, were reckoned low:—Tribe of Reuben (the eldest son of Jacob) 4 Simeon 22,200; Gad 40,500; Judah 76,500; Is 64,300; Zebulun 60,500; Manasseh 52,700; Ep 32,500 (the tribes of Manasseh and Ephraim wer from Joseph); Benjamin 45,600; Dan 64,400; 53,400; and Naphthali 45,400. Among these tribes the land was divided. The tribe of L which belonged Moses, Aaron, and Eleazer th priest), amounting to 23,000 males from a mon and upwards, received no share of the land: bei apart for the priesthood, the tenth or tithe of the g produce was assigned them as their perpetual i tance. By making a special agreement with the tribes that they should assist them against the co enemy, the two tribes of Gad and Reuben, and th tribe of Manasseh, were permitted to appropriat for their inheritance in Gilead and Bashan, Arabian side of the Jordan.

Previous to the settlement of the tribes in C they were called together by Moses to receive his ing address, for it was ordained that he should not the land along with them. The account of this r rable assemblage is given in the first chapter of D roneay. Having first narrated the history of tedious journey in the wilderness, and its objects, proceeded to promulgate and explain to them, as lawgiver, the statutes and commandments for obedience, and the form of government, secula spiritual, which they should adopt. Among other t he recommended the erection of a capital city, the great temple should be, and to which the people should repair three times a-year, for the pu of offering thanks to God for his former benefit entreating him for those they should require here also with the view of maintaining a friendly corre dence among the various tribes and orders of p In obedience to this and subsequent injunction Israelites built Jerusalem, and established the t on Mount Zion within its walls. Moses, in concl his lengthened address to the people of Israel, s song of praise to God, breathing a spirit of the exalted piety (Deut. xxxii.), and bidding the sons

* An account of Arabia Petræa, through which the Israelites travelled, is given in the latter part of the present sheet.

tude adieu, proceeded alone to some secluded spot
land of Moab, where he died.
ses was succeeded by Joshua as a leader, and by
he Israelites were conducted across the Jordan.
olitical government of the various tribes, after
conquest and settlement of Canaan, appears to
been republican, with military leaders called
s; but these acted by the direction of the priest-
who were immediately counselled by the Deity
the sanctuary; the government of the Jews
has been called a *theocracy*, or government by

Their position, in the midst of hostile nations,
red constant vigilance. In the book of Judges,
d them at first under the command of Judah,
cessor of Joshua, and afterwards of Gideon, and
leaders. The instances of generous patriotism,
very, and of devout confidence in the God of their
rs, which are shown in the acts of several of the
s, render the record of their history one of the
interesting and romantic in the earth. Yet they
often reduced to the greatest distress. "Because
Midianites," it is said, "the children of Israel
them dens in the mountains, caves, and strong-
; and when Israel had sown, the people of the
ame up against them, and destroyed the increase
e earth, till they left no sustenance for Israel,
r sheep, nor ox, nor ass—for they came up as
rasshoppers for multitude; and the children of
cried to the Lord." From these calamities they
at times delivered by the devotion of some pas-
soldier among their tribes. Their songs of re-
g on such occasions still more pathetically tell
isturbed state of the country, and present the
les of its inhabitants for three hundred years
re Christ 1427 to 1112), while they formed a re-
e under their judges. It says much for this people,
in the midst of such a scene of unrest, they con-
d still to cultivate letters. The beautiful simpli-
of the narratives given concerning the heroes of
country, is not to be equalled in any other remains
tiquity.

e epoch of kings succeeded that of judges. The
of Saul, their first monarch, though the people
stronger by being united, was gloomy and troubled.
d, who succeeded, was a soldier and a conqueror.
endered the Hebrews formidable to the whole of
enemies, and gave them a regular and defensible
ion, expelling their old antagonists from every part
e country. He left an empire peaceful, respected,
strong; and, what was of as much importance, he
ted from among his sons a successor who was
to improve all these advantages, and to add to the
ess which his countrymen had already made in
erity. Under Solomon, the name of the Hebrew
nment being able to protect its subjects in other
ries, the people and their king began to employ
selves in commerce. Their trade was at first
ited on that of Tyre, a people speaking a similar
age with themselves, and like them, too (though
inly in a smaller degree), acquainted with the art
iting. We only find in Scripture an account of the
of commerce in Solomon's time; but there is no
n to suppose that after his day it was discontinued.
s, perhaps, no longer a matter of state; but the
h of the country, which exposed it to continued
e, and the number of prosperous Hebrews who
found in all parts of the earth (it would be idle to
nat these were all brought away as captives), render
hable that, from the splendid reign of this monarch,
always continued to be addicted to commerce. It
eed likely that they had been so before his reign,
hat Solomon merely took commerce under the pro-
n of the state; for there is no instance on record
y monarch all at once, successfully, creating
ional trade. However this may be, a greater con-
cannot be imagined than between the troubles of
ime of the judges (only one hundred years before),
the peace, security, and enjoyment of this reign.
d the king made silver to be in Jerusalem as stones;
and cedars made he to be as sycamore trees that are
in the vale for abundance; and Judah and Israel were
many; as the sand which is by the sea-shore for multi-
tude, eating, and drinking, and making merry." The
riches lavished upon the temple, which was erected in
his time, are still the wonder of the east and west; and
though the building itself may now be rivalled in extent
by many of our parish churches, yet the gold, ivory,
and other precious materials employed in its decora-
tion, indicate a wealth which must, at that time, have
been without a parallel. Both Solomon, and David
his father, were men accomplished in learning, as well
as in the arts of government; and the writings which
they have left, if they show their own abilities, indicate
not less a great attention to the cultivation of knowledge
among the rest of the Hebrews.

After the death of Solomon, the country fell into the
same divisions which had weakened it in the time of
the judges. Each of the districts of North and South
Israel was under a separate king, and the people were
exposed both to the attacks of their enemies and to
quarrels with each other. Their history is a succession of
agitating conflicts for independence, and of unexpected
and remarkable deliverances, of a similar nature to
those of the earlier period, and they continued for about
the same length of time (380 years); but they are
marked by fewer of those traits of heroic devotion which
distinguished the epoch of the judges. The backslid-
ings, errors, and misgovernment of their kings, is the
chief and painful subject which is presented to us; and
though these are relieved at times by the appearance
of such monarchs as Josiah, Jehoshaphat, and Heze-
kiah, yet the whole history of this period is overcast
with the gloominess of progressive decline. By far the
most delightful parts of it are those which relate to the
lives of the prophets, who were raised up at intervals
to warn the nation and its rulers of the fate which they
incurred by forsaking the religion of their fathers.
These inspired men sometimes sprang up from among
the humblest classes of the community; one from "the
herdsmen of Tekoa," another from "ploughing with
twelve yoke of oxen;" several were of the priestly
order, and one (Isaiah) is said to have been of royal
lineage; but the works of all are marked with the same
sacredness, force, and authority. They reprehend their
countrymen, in the most eloquent strains, at one time
for their idolatry, and at another for their hypocrisy;
and their indignation is expressed with the same free-
dom and dignity against the vices of the highest and
the lowest. It has become fashionable to trace the free
spirit of our national tone of thinking to the historians
and orators of Greece and Rome, which are taught in
our schools; but any one who looks into the writings of
the Hebrew prophets, and sees the boldness and energy
with which the humblest of them threatens the nobles
and princes of his country, or chastises the vices of the
nation around him, will remark the pedantry of seeking,
in volumes known only to the learned, for an effect
which may be traced to books whose strong and pathetic
eloquence has long swayed the affections of every peas-
ant of the country. There is no subtlety of reasoning,
no sporting with ambiguities in these writings; every
thing is bold, decided, and powerful, appealing to great
principles, and marked with high and energetic feelings.
What a film of fancy-work are the metaphysical inge-
nuities of Plato, compared with the firm, broad, and
uncompromising morality, the mild domestic charities,
taught in the books of Psalms and Proverbs, or the pa-
thetic and indignant remonstrances of the prophets
against the backslidings of the "daughter of their
people!"

At the end of the epoch of the kings (about 600
years before Christ), the land of Israel was swept by
several powerful invaders, who carried off many thou-
sands of the people into captivity. Little is known of
the fate of those of the northern district, who are by
some supposed to have been carried to India, by others
to Tartary; but there are many interesting notices of
the captives of Judah. These were carried to Babylon,

a flat country intersected by rivers, to the eastward of their own. Here they seem to have been treated with kindness, and many of them even arrived at wealth and distinction. Nothing, however, could overcome their regret at being torn from the country of their ancestors —a feeling which is expressed with unrivalled beauty in the 137th Psalm, where the Hebrew captive looks back mournfully to the mountains and brooks of Judah, as he hangs his harp on the willows by the sluggish Euphrates, and refuses, with sorrow and scorn, to gratify his conquerors by singing the celebrated songs of his country in a strange land. It is a further proof of what we have said of the general intelligence and education of the Jews, that all the conquerors who carried them off granted them high privileges in their new countries. Alexander, it is said, made them equal with his own Macedonians in the city which he founded; Ptolemy conferred on them similar privileges. We find one celebrated man of their nation (Daniel) chief minister of two successive monarchies.

After seventy years (during which there is little recorded of the people who were left in the country), permission was given to some of the chief Hebrews of the captivity to return with their people to Judea, and to establish there a government, conducted by their own countrymen, under the protection of the Persians. They were also allowed to rebuild the temple. Many families returned accordingly; and the Hebrews from this period enjoyed, as tributaries of this powerful monarchy, a peace of about 220 years, during which their country seems to have been quiet and prosperous. About 187 years before Christ, in consequence of their becoming involved in the quarrels of neighbouring powers, they were obliged to maintain a series of struggles in behalf both of their religious and national independence, more fierce and prolonged than we read of in almost any other nation. We are accustomed to admire the gallantry and perseverance of Wallace and of William Tell in behalf of their country; but Judas Maccabeus surpassed both, and with more brilliant success. The actions of one family of Jewish priests, belonging to a town (Modin) of which the very site is unknown, might dignify the scutcheons of a whole aristocracy. Under them the Hebrews were again, for three reigns, an independent and even a powerful people.

The empire of the Romans was now extending itself to the east; and that power, being called in to aid the Hebrews on one occasion (about seventy years before Christ), seized the opportunity to establish its influence among them permanently. Their kings, the three Herods, and their other rulers, were now dependants of the emperor, and their country the tributary of Rome. On obtaining full possession of the country, the Romans divided Palestine (the region between the Mediterranean and the Jordan) into three tetrarchies or provinces—Judea, Samaria, and Galilee. It is creditable to the Romans, however, that while thus taking complete political possession of the ancient land of Israel, they in no respect interfered with the religion or other usages of the people, which they left under the direction of the sanhedrim and elders as of old. But notwithstanding this favourable arrangement, the Jewish nation was restless and unhappy; it was broken up into parties and sects, and some of these continually plotted schemes for a restoration of independence. The country was in this humbled and distracted condition when "Jesus was born in Bethlehem of Judea, in the days of Herod, the king." This most important of all events, which occurred in the reign of the Emperor Tiberius, and marks the commencement of our era, made no difference politically in the condition of the Jewish people. During the continuance of Christ on earth, we do not read of any civil war in Palestine; but between thirty and forty years afterwards, serious insurrections broke out against the Roman authority, and the country was exposed to the greatest sufferings. In the year 70, Titus took Jerusalem by assault, burned the temple, and sold into slavery, or drove into exile, all the inhabitants who escaped death. About 11(Jews perished during the siege and at the destru of Jerusalem.

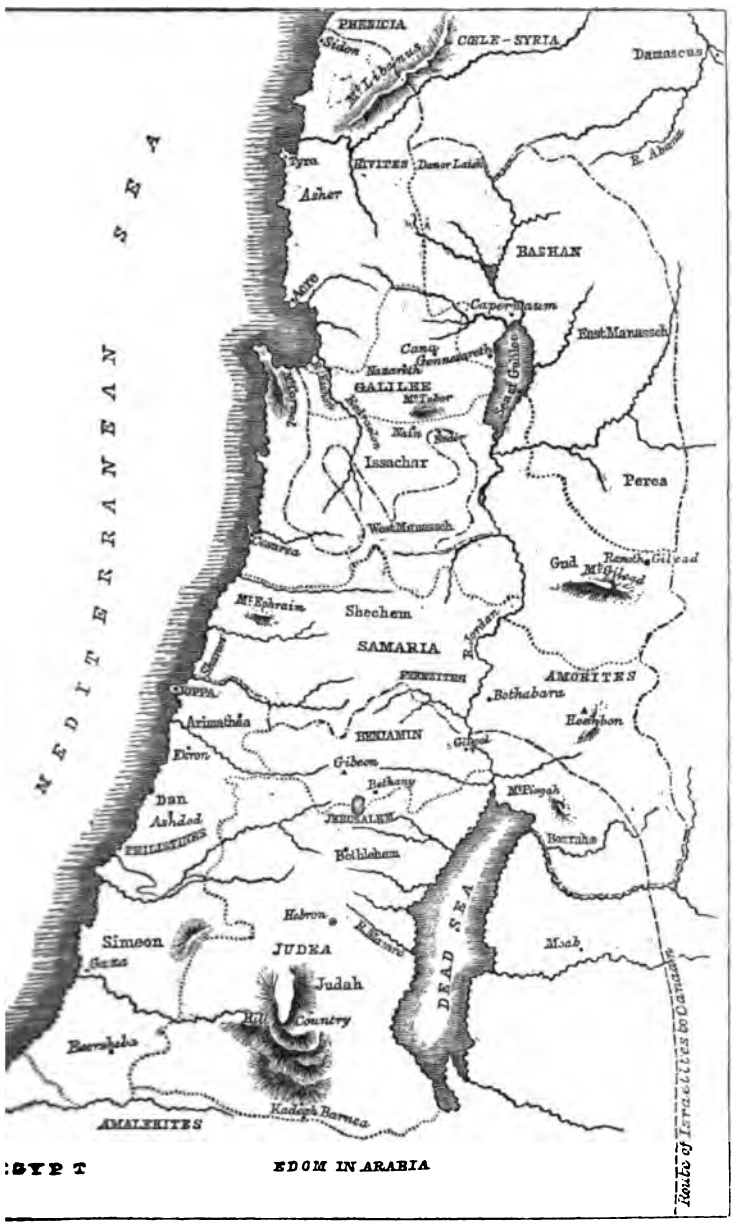
Reckoning from the settlement of Canaan by Israelites till this last dire calamity, the Jewish n existed in a regular form, though under various n fications, for 1560 years. Since they were first scatt over the face of the earth, in which condition they exist, 1770 years have elapsed (reckoning till 184(that they have already been longer a scattered they were a united people. By a late calculation, ascertained that the Jews now existing in diff parts of Europe amount to 1,918,053; in Asia 738, in Africa 504,000; in America 5700; and in New land 50—grand total 3,218,000. Other estimates c the number to 5,000,000 or even 6,000,000. In countries they are still treated as strangers, and d the rights of citizenship, though in manners, langu and general conduct, they do not differ from the mon inhabitants. The government of the United S of North America was the first which placed them the same political level with other citizens. recently, the laws excluding them from civil privil have been one after another abolished in the king of the Netherlands, until they are now in all res on an equality with the other people of that cou There is, we believe, evidence of the most incontro tible nature, namely, statistical evidence, to show crime has diminished among the Hebrews, as invid distinctions have been thus done away with.

For a period of upwards of 200 years after the dispersion of the nation, Palestine continued in a serable condition. On the conversion of the Rom to Christianity, it became an object of religious v ration, as the scene of the ministrations of Christ his apostles. The Empress Helena repaired in pi mage to the "Holy Land," viewed all the spots rend remarkable by events in the gospel history, and l splendid temples, or other religious structures, on t sites. The Holy Land was now enriched by the crow pilgrims who came from all parts of the Christian w The destinies of Judea, however, were changed the invasion of the fanatical followers of Mahon in the sixth century, and soon fell under their s The caliphs, or Arabian monarchs, indeed, still vie her holy places with reverence, and were induce encourage pilgrimage, from the gain which it affor But when the Turks, an ignorant and barbarous r poured in from the north, the same courtesy was longer observed. They profaned the holy places, committed outrages of every kind upon the visitant the Holy Land. The pilgrims on their return rel the dangers they had encountered. These represe tions kindled the religious zeal of the Christians Europe into a flame, and a general ardour was a kened to "free the holy sepulchre from thrall." ensued a series of warlike expeditions, termed crusa for the recovery of Palestine from the Mahommed After various successes and disasters, the crusades minated in the middle of the thirteenth century, leav the Holy Land still in the possession of a barbar Mahommedan people. (See article History or Middle Ages.) In the year 1517, Palestine was nexed to the Turkish empire, and still remains a tion of Turkey in Asia. As such, it belongs to pachalik of Damascus, and is (or was lately) under jurisdiction of Mehemet Ali, the pacha of Egypt, whose firm though precarious government it has b rendered much more safe to the visits of travell than it was in past times. Its population now cons of a mixture of Turks and Arabs, chiefly the lat with a small number of Jews and Christians.

PALESTINE.

Palestine, or the Land of Canaan, in which Israelites settled after their protracted wanderings the deserts, is a small country, forming part of Sy (which is a modern name for an indistinct portion north Arabia), and lies on the shore of the Medit

an Sea, between the 31st and 34th degrees of north latitude. With the whole of Arabia behind it, it may escribed as a frontier border to that extensive pastoral region. Lying with the Mediterranean (anciently Great) Sea on the west, it has Asia Minor (including Phrygia, Pamphylia, and Phœnicia) on the north, bia on the east and south-east, and Idumea or Arabia Petræa on the south. The part of Arabia g nearest to it on the east comprises the districts anciently called Mesopotamia and Babylonia, beyond ch, in an easterly direction, is Persia. The country has been called Palestine, as is supposed, from the Philistines, who were once its possessors; but in the Scriptures, from various circumstances, it has received the appellations of the "Promised Land," "the Land of Canaan," and "the Land of Judea." In modern times, from its connection with the events which occurred within it upon the promulgation of Christianity, it is more generally called "the Holy Land."



Palestine extends from north to south a length of three hundred miles, and about 50 in breadth, and is, therefore, in point of size, of nearly the same extent as Scotland. The general character of the country is that of a hilly region, interspersed with moderately fertile vales; and being thus irregular in surface, it possesses a number of brooks or streams, which, for the most part, are swollen considerably after rains, but are almost dry in the hot seasons of the year. The longest and principal valley is in the centre, in a direction from north to south, and in this flows the river Jordan, which is the chief of the Judean streams. It arises from the outskirts of the mountains of Lebanon or Libanus on the north, flows into the lake of Tiberias, or sea of Galilee, and thence continues its course to the Dead Sea, from which there is no perceptible outlet, the water probably waning by means of evaporation. The present condition of Palestine scarcely corresponds with its ancient fertility. This is chiefly attributable to the devastating effects of perpetual wars, and some

ical changes have also contributed to the destruction of agricultural industry. Yet, after all, so excelwould the soil appear to be, and so ample its natural resources, that Canaan may still be characteras a land flowing with milk and honey. Its pastures are extensive, and of the richest quality; and the rocky stry is covered with aromatic plants, yielding to the wild bees who live in the hollow of the rocks such an ndance of honey, that the poorer classes use it as a common article of food. Dates, which are found springup in the midst of the most arid districts, are also another important article of consumption. If to these add olive oil, an article so essential to an oriental, the ancient fertility of even the most barren part of in becomes easily accounted for. Delicious wine is still produced in some districts, and the valleys r plentiful crops of tobacco, wheat, barley, and millet. Among other indigenous productions may be mented the cedar and other varieties of the pine, the cypress, the oak, sycamore, mulberry-tree, fig-tree, willow, acacia, aspen, arbutus, myrtle, tamarisk, oleander, oshar, doom, the turpentine, almond, peach, ne and locust trees; the mustard plant, aloe, citron, apple, pomegranate, and many flowering shrubs. Other

indigenous productions have either disappeared, or are confined to circumscribed districts. Iron is found in the mountain-range of Libanus, and silk is produced in abundance in the plains of Samaria.

Generally speaking, the climate is mild and salubrious. From May to August the sky is clear and cloudless, but during the night there falls a copious dew, which moistens the soil. Intensely cold nights, however, frequently succeed to very sultry days—a vicissitude more than once referred to in Scripture. Rain falls in sufficiency during the rest of the year, to which, in the absence of springs, the fertility of Palestine is mainly attributable. As the streams pour in impetuous torrents through the vales after heavy rains, it is unsafe to erect habitations on the plains, and such most probably is the reason why the towns and villages of Palestine are almost uniformly built upon elevated grounds.

Of the animals which prevail, or formerly prevailed, in Palestine, it is unnecessary to say much. The wild animals referred to in Scripture, such as the lion, wolf, leopard, &c., have almost totally disappeared. The fox is still common. The horse does not appear to have been adopted till after the Babylonish captivity, the wild ass being deemed worthy of serving even royalty. The breeds of cattle reared in Bashan and Gilead were remarkable for their size, strength, and fatness; but this is far from being the case now. The vulture, falcon, jackdaw, nightingale, field-lark, goldfinch, partridge, quail, and the quail of the Israelites, the turtle and ringdove, are found, and various kinds of land and water game are abundant. The Holy Land is infested with a frightful number of lizards, different kinds of serpents, vipers, scorpions, and various insects. Flies of every species are also extremely annoying. Ants are very numerous in some parts: one traveller describes the road from El Arisch to Jaffa, as, for three days' journey, one continued ant-hill. But these creatures, numerous as they are, are harmless in comparison to the locusts which overspread the country. These insects sometimes come in flights, which, on alighting, cover the land, and destroy every blade of herbage in their way. To oppose their destructive ravages, the inhabitants attack them with fire and branches of trees, and endeavour, by every other means, either to kill them in masses or to cause them to take to flight. It is not uncommon for an army of soldiers to be sent out to assist in slaughtering or expelling them from the land.

Travellers usually reach Palestine from Europe by sea, few daring to encounter the danger of the route from Egypt, through the land of Edom. Vessels from Malta or Alexandria regularly proceed to Acre, and from that port the traveller journeys to Jerusalem and other parts of the country. The most interesting route seems to be, in the first place, southwards, along the coast to Jaffa, Ashdod, Ashkalon, Gaza, &c., and then striking inland to Jerusalem, Bethlehem, and the Dead Sea; proceeding afterwards in a northerly direction to Tiberias, Nazareth, and Lebanon; lastly, before leaving Syria, making a journey to the ruined city of Palmyra, and to Damascus. In visiting these and other places mentioned in Scripture, the traveller is scarcely [illegible] much shocked with the changes produced [illegible] and localities, by the hand of [illegible] that of over-rigorous Christians. By the Crusaders [illegible] and other individuals, convents, churches, [illegible] have been erected over almost every [illegible] sacred by the ministrations of our Lord, [illegible] original character of the principal [illegible] the New Testament is altogether destroyed.

ACRE—ITS HISTORY.

Acre stands close to the sea, and the chief part of it, extending in the form of a [illegible] miles to the north of Mount Carmel, which [illegible] the sea-shore. It was originally called Accho, and is [illegible] luded to in sacred writ: of this name Acre is evidently corrupted. Its name is usually preceded by the words "St Jean," in consequence of the place h[illegible] been given by Richard of England to the Knigl[illegible] St John of Jerusalem; at one time it receive[illegible] name of Ptolemais. This place was visited b[illegible] apostles, and particularly by St Paul. It has bec[illegible] scene of a variety of bloody contests, especially d[illegible] the period of the Crusades, and was the last place[illegible] which the Christians were driven. The Turks ultim[illegible] laid hold of it with a numerous army, after a fu[illegible] siege, when terrible outrages were committed. [illegible] were in possession of it from 1291, till compell[illegible] surrender it to Mehemet Ali, who in his turn has[illegible] obliged to give it up to the Turks, by the warlike[illegible] rations of the European powers in 1840. As Ac[illegible] reckoned the key of Syria, and has the best por[illegible] French under Bonaparte made violent efforts to [illegible] it; they were, however, as is well known, success[illegible] repelled. Acre is very strongly fortified, being [illegible] enclosed with high walls, and is considered the stro[illegible] place in Syria. The houses are of stone, with [illegible] like terraces, the entrances to which are narrow[illegible] many appear to communicate with each other. [illegible] streets are dirty, and so contracted, that there [illegible] more than room for a loaded camel to pass a[illegible] hence the air is very impure. The bazaars are r[illegible] and the inhabitants miserable. The populati[illegible] reckoned to be about 10,000.

Mount Carmel forms a promontory, or majestic l[illegible] land, on the Mediterranean. It runs from east to [illegible] and rises about 2000 feet from the level of the se[illegible] which its base is washed. Near it runs Kishon, o[illegible] the rivers which are particularly alluded to in the s[illegible] writings. Carmel is the most beautiful mountai[illegible] Palestine; is of great length, and in many parts cov[illegible] with trees; and a part of its summit is pointed o[illegible] the place where Elijah prayed for rain, and saw[illegible] humid cloud rise out of the sea. On the 20th of [illegible] the Christians proceed to perform acts of devoti[illegible] memory of the prophet. There was formerly a mo[illegible] tery here, but it is now abandoned.

Between this point and Jaffa we meet with the [illegible] of several ancient villages and towns, amongst whi[illegible] Cesarea. "Perhaps there has not been," says[illegible] Clarke, "in the history of the world, an example of [illegible] city that in so short a space of time rose to suc[illegible] extraordinary height of splendour as did this of Ces[illegible] or that exhibits a more awful contrast to its fo[illegible] magnificence, by the present desolate appearance [illegible] ruins." In fact, not a solitary inhabitant remains w[illegible] once stood the proud city of Herod. Its theatre[illegible] palaces, and temples, form a marble desert.

A large part of this now desolate territory—th[illegible] from Carmel to Jaffa, an interval of about sixty [illegible] —is the plain of Sharon, celebrated in Scripture f[illegible] beautiful flowers and fertility, particularly its "r[illegible] of which distinct mention is made. In the present [illegible] though in a wild condition, it still yields pomegran[illegible] oranges, figs, and other eastern fruits.

Jaffa, which is near the southern extremity of the p[illegible] of Sharon, and is the Joppa of Scripture, is situate[illegible] a cliff, to command over-hanging the Mediterranean. [illegible] is one of the most ancient seaports in the world, [illegible] a place of considerable traffic it is now ne[illegible] from Carmel to Jaffa, an interval of about sixty [illegible] —is the plain of Sharon, celebrated in Scripture f[illegible] beautiful flowers and fertility, particularly its "r[illegible] of which distinct mention is made. In the present [illegible] though in a wild condition, it still yields pomegran[illegible] oranges, figs, and other eastern fruits.

Jaffa, which is near the southern extremity of the p[illegible] of Sharon, and is the Joppa of Scripture, is situate[illegible] a cliff, to command over-hanging the Mediterranean. [illegible] is one of the most ancient seaports in the world, [illegible] a place of considerable traffic it is now ne[illegible] ordered. The materials of his ter[illegible] by [illegible] Lebanon: here the proj[illegible] and there, in apos[illegible] habitants to [illegible]. The tow[illegible] and the inhabitants amount to [illegible] thousand, who are mostly T[illegible] Latterly it has been greatly injured by [illegible] Between Jaffa and El Arisch, the extr[illegible] of the Holy Land on this direction, lie var[illegible] mentioned in the scriptural record. ASHDOD, GATH, ASHKELON, AND GAZA.

At about an hour's journey south from Jaff[illegible] [illegible] ancient Ashdod, standing on the sum[illegible] [illegible] gravelly hill, but now in a changed condition.

ruined village of Tookrair, situated also on the top of a hill, occupies the site of Ekron, which does not possess the smallest vestige of its former grandeur. Gath, a place of strength in the time of the prophets Amos and Micah, is now also either entirely gone or degenerated to a few ruins and a hamlet. Askelon, farther on to the south, and likewise situated on the summit of a hill at the distance of three miles from the sea, still, to external appearance, maintains something of its ancient character. Its position is strong, and its walls, which are of great thickness, and considerable height, are built on the top of a ridge of rock, winding round the town in a semicircular direction, and terminating at each end in the sea. But, alas! they enclose not a living being. How truly has been fulfilled the prophecy of Zachariah, "The king shall perish from Gaza, and Askelon shall not be inhabited." Gaza is truly without a king. It is now only a large village, situated a few miles south from Askelon, with a number of poor narrow streets. There is some trade, however, carried on in Gaza, particularly in cotton, and the inhabitants exceed 2000. This place was formerly of great magnificence and strength; for two months it baffled all the efforts of Alexander to take it.

Such are the chief places along the coast from Jaffa to the southern boundary of Palestine. We now take the route inland from Jaffa to Jerusalem.

JAFFA TO JERUSALEM.

About nine miles from Jaffa stands Ramla, or Rameli, the ancient Rama of Ephraim, and very probably the Arimathea of the New Testament. It is situated in a rich plain, and contains about 2000 families. Here there are several convents and mosques; and on a hill to the west of the town stands a venerable ruin, called the Tower of the Martyrs, a name probably derived from the martyrs of Sebastia, in Armenia, whose bodies have been here deposited. About a league from this is Lydda, still called Loudd, where St Peter cured Æneas of the palsy. This place is now a poor village, with few inhabitants. The country which surrounds it, however, is of a rich and fruitful soil. Farther on is the Arab village of Bethoor, supposed with much probability by Dr Clarke to be the Bethoron of Scripture. We enter now into the country of Judea. It is very mountainous; "and its scenery," says Dr Richardson, "brought strongly to my recollection the ride from Sanquhar to Leadhills, in Scotland; and to those," he continues, "who have visited this interesting part of my native country, I can assure them the comparison gives a favourable representation of the hills of Judea." He goes on to say, that the great difference lies in the contrast which the countries present in the character of their roads and inhabitants, those of Palestine being of the very worst description. Among the places of note which lie in the route to Jerusalem, is Modin, well known as the site of the city and tombs of the illustrious and patriotic Maccabees. It is still a place of strength, and goes by the same name. As the road approaches Jerusalem, the vegetation becomes exceedingly scanty, and the country has a bare, rocky, and rugged appearance.

JERUSALEM.

Jerusalem—the city of Zion—the ancient capital of Judea, is situated on the western slope of a rocky hill, at the distance of about forty-five miles eastward from the shore of the Mediterranean. In the present day, it cannot be said to possess any resemblance to its condition in the period of its ancient glory, for the repeated sackings by Persians, Romans, Saracens, and other warlike intruders, also the changes it underwent at the period of the crusades, have obliterated all its original structures; and it now exhibits the external aspect of a Turkish city, with round topped edifices and mosques, and environed with a wall for its defence. It is now only between two and three miles in circuit, and can be walked round in forty-five minutes. The town is built irregularly, somewhat in the form of a square, has pretty high walls, and six gates, which still bear Hebrew names. The houses are of sandstone, three stories high, and without windows in the lower story. This lifeless uniformity is only diversified here and there by the spires of the mosques, the towers of the churches, and a few cypresses. The population has been variously estimated at from 20,000 to 25,000. "It can hardly," says Mr Carne, in his letters from the East, "exceed 20,000; 10,000 of these are Jews, 5000 Christians, and the same number Turks. The lower division of the city," he continues, "towards the east, is chiefly occupied by the Jews: it is the dirtiest and most offensive of all. Several of this people, however, are rather affluent, and live in a very comfortable style; both men and women are more attractive in their persons than those of their nation who reside in Europe, and their features are not so strongly marked with the indelible Hebrew characters, but much more mild and interesting. But few passengers in general are met with in the streets, which have the aspect, where the convents are situated, of fortresses, from the height and strength of the walls the monks have thought necessary for their defence. Handsomely dressed persons are seldom seen, as the Jews and Christians rather study to preserve an appearance of poverty, that they may not excite the jealousy of the Turks. The women, in their close veils and white dresses, look like walking corpses. The streets are unpaved, and filled either with heaps of dust or with mire. Nothing is to be seen but veiled figures in white, insolent Turks, and stupid or melancholy Christians." Weavers and slipper-makers are the only artisans. A multitude of relics, which are probably not all manufactured in the city, but are sent in also from the neighbourhood, are sold to the credulous pilgrims. Nevertheless, this city forms a central point of trade to the Arabians in Syria, Arabia, and Egypt. The people export oil, and import rice by the way of Acre. The necessaries of life are in profusion, and quite cheap, the game excellent, and the wine very good. The pilgrims are always a chief source of support to the inhabitants; at Easter they often amount to 5000. But few of them are European. Jerusalem has a governor, a cadi or supreme judge, a commander of the citadel, and a mufti, to preside over religious matters. The citadel, which is pretended to have been the castle of David, is a Gothic building throughout. It is called the Pisan Tower, probably because it was built by the Pisans during the crusades. All the pilgrims go to the Franciscan monastery of the Holy Saviour, where they are maintained a month gratuitously. Besides this, there are sixty-one Christian convents in Jerusalem, of which the Armenian is the largest. They are supported by benevolent contributions, principally from Europe, and form the only place of residence for travellers.

Jerusalem is esteemed by Mahommedans as a holy city, though not to the extent it is by Christians; they have here a temple or mosque, called the Mesque of Omar, which is on a scale of extraordinary magnificence, and contains a stone supposed to be of miraculous origin. Jerusalem, however, is chiefly of importance to the Turks, from the revenue which is derived from the Christian pilgrims. The spot to which all Christians first direct their attention, is that on which took place the crucifixion and burial of our Lord, now marked by

The Church of the Holy Sepulchre.

Mount Calvary, the spot on which the crucifixion of Christ took place, was originally a rising ground without the walls, but was afterwards enclosed within the city, altered entirely in its outlines, and made the site of a church founded by the Empress Helena. This Church of the Holy Sepulchre, as it is called, is about one hundred paces in length, and sixty in width. It is in the form of a circle, having a heavy dome or cupola, the frame of which is made of the cedars of Lebanon, and covered with a kind of stucco. It has a spacious and magnificent appearance, the Corinthian order of architecture prevailing. The present building is not altogether old. A

fire which occurred in 1808, destroyed a considerable portion of the edifice, and the present structure has been completed in the original style chiefly at the expense of the Greek religionists, who hence possess the best part of the edifice for their religious services, greatly to the distress of the Romish clergy. None of the Protestant churches takes any charge of the place. Carne gives us the following account of his visit to the church:—

"There was a guard of Turks in a recess just within the door, to whom every pilgrim is obliged to pay a certain sum for admission; but we were exempted from this tax. In the middle of the first apartment is a large marble slab, raised above the floor, over which lamps are suspended: this is said to be the space where the body of the Redeemer was anointed and prepared for the sepulchre. You then turn to the left, and enter the large rotunda, which terminates in a dome at the top. In the centre of the floor stands the holy sepulchre: it is of an oblong form, and composed of a very fine reddish stone brought from the Red Sea, that has quite the appearance of marble. Ascending two or three low steps, and taking off your shoes, you enter the first small apartment, which is floored with marble, and the walls lined with the same. In the centre is a low shaft of white marble, being the spot to which the angel rolled the stone from the tomb, and sat on it. You now stoop low to enter the narrow door that conducts you to the side of the sepulchre. The tomb is of a light brown and white marble, about six feet long and three feet high, and the same number in breadth, being joined to the wall. Between the sepulchre and the opposite wall the space is very confined, and not more than four or five persons can remain in it at a time. The floor and the walls are of a beautiful marble; the apartment is a square of about seven feet, and a small dome rises over it, from which are suspended twenty-seven large silver lamps, richly chased and of elegant workmanship—presents from Rome, of the courts and religious orders of Europe: these are kept always burning, and cast a flood of light on the sacred tomb, and the paintings hung over it, one Romish and the other Greek, representing our Lord's ascension, and his appearance to Mary in the garden. A Greek or Romish priest always stands here with the silver vase of holy incense in his hand, which he sprinkles over the pilgrims.

Wishing to see the behaviour of these people, who come from all parts of the world, and undergo the severest difficulties to arrive at this holy spot, we remained for some time within it; and the scene was very interesting. They entered: Armenians, Greeks, and Catholics, of both sexes, with the deepest awe and veneration, and instantly fell on their knees; some, lifting their eyes to the paintings, burst into a flood of tears; others pressed their heads with fervour on the tomb, and sought to embrace it; while the sacred incense fell in showers, and was received with delight.

In an apartment a little on the left of the rotunda, and paved with marble, is shown the spot where Christ appeared to Mary in the garden. Near this begins the ascent to Calvary, which consists of eighteen very lofty steps; you then find yourself on a floor of beautifully variegated marble, in the midst of which are three or four slender white pillars of the same material which support the roof, and separate the Greek division of the spot from that appropriated to the Catholics; these pillars are partly shrouded by rich silk hangings. At the end stand two small and elegant altars; over that of the Catholics is a painting of the crucifixion, and over the Greek is one of the taking down the body from the cross. A number of silver lamps are constantly burning, and throw a rich and softened light over the whole of this striking scene.

The street leading to Calvary has a long and gradual ascent; the elevation of the stone steps is above twenty feet; and if it is considered that the summit has been removed to make room for the sacred church, the ancient hill, though low, was sufficiently conspicuous. The very spot where the cross was fixed is shown; it is a hole in the rock, surrounded by a silver rim, and each pilgrim prostrates himself, and kisses it with the greatest devotion. Its identity is probably as strong as that of the cross and crown of thorns found a few feet below the surface; but where is the scene around or within the city that is not defaced by the sad inventions of the fathers?"

The priests connected with these sacred places keep up a system of religious ceremonies, in some of which it would be impossible to say whether solemnity, fervour, superstition, ignorance, or sheer madness, most predominates. The ceremonies which take place during the season of Easter are ridiculous and absurd in the extreme. Upon Good Friday night the monks enact a sort of drama of the death of our Lord, in which they severally perform the various characters, such as Joseph of Arimathea and Nicodemus. They have a figure of Christ as large as life nailed to a cross, which they carry before them in solemn procession. No circumstance in the awful tragedy is omitted, from the singing of the hymn to the anointing of the body for burial, and its deposition in the sepulchre. The transactions of Easter day partake more of comedy than tragedy. It is a scene of superstitious riot and pitiful absurdity, which we think it unnecessary to describe. The reader may have some idea of it by imagining to himself what would be the consequences if bedlam were let loose upon the holy sepulchre. It is only doing justice, however, to those who have the keeping of the "place where our Lord lay," to observe, that some of the ceremonies are both solemn and impressive, without much admixture of absurdity. It is impossible, however, to read the exhibitions of Easter day and eve, without a painful misgiving as to every thing connected with the holy city.

Mounts Zion and Moriah.

On crossing the small ravine which divides the modern city from Mount Zion, the attention is attracted to three ancient ruins, covered with buildings comparatively modern—said to be, respectively, the house of Caiaphas, the place where Christ held his last supper, and the tomb or palace of David. The first of these is now a church, the services of which are performed by the Armenians: the second presents a mosque and a Turkish hospital; while the third, a small vaulted apartment, contains only three sepulchres, formed of dark-coloured stone. This holy hill is equally celebrated in the Old Testament and in the New. Here the successor of Saul built a city and a royal dwelling; here he kept for three months the ark of the covenant; here the Redeemer instituted the sacrament, which commemorates his death; here he appeared to his disciples on the day of his resurrection. The place hallowed by the last supper, if we may believe the early fathers, was transformed into the first Christian temple the world ever saw, where St James the Less was consecrated the first bishop of Jerusalem, and where he presided in the first council of the church. Finally, it was from this spot that the apostles, in compliance with the injunction given them, went forth to teach all nations.

A shallow vale, called the valley of Millo, separates Mount Zion from Mount Moriah, on which the temple stood; this was originally an irregular hill, separated from Mount Zion and Acra, as well as from Beretha. For the purpose of extending the appendages of the temple over an equal surface, and to increase the area of the summit, it became necessary to support the sides, which formed a square, by immense works. In order to connect it with Mount Zion, it was necessary to throw a bridge across the valley of Jehoshaphat. According to Josephus, the execrable but magnificent monarch Herod rebuilt the second temple; but there is reason to suppose that he only added considerably to its extent. Its fate is well known: the prediction of our Saviour, that one stone should not be left upon another, was literally fulfilled. After the Caliph Omar took Jerusalem, buildings were erected on the spot where Solomon's temple stood, the rock was enclosed with walls, and, by subsequent additions and embellishments, it became the splendid mosque which we have already described.

Leaving the city at the gate of St Stephen, the pilgrim is conducted to the spot nearly contiguous where it is supposed he suffered martyrdom. He is then shown the church of the sepulchre of the Virgin Mary, situated in the valley between the Mount of Olives and Jerusalem, founded by St Helena. This is a small square building, flat on the roof, with a door on the south side, by which there is a descent into the interior by steps, having on the right hand a small chapel, with the tomb of St Ann, the mother of Mary. On the left is another similar to the former, where Joseph, the husband of the latter, is said to have been interred. Although the authenticity of such assertions depends on the probabilities of tradition, yet the solemn stillness of the place, the sepulchral gloom, and, above all, the associations which are calculated to affect the mind on seeing every object about this city, combine to render a visit to this consecrated spot so deeply interesting, that a traveller of the least sensibility never can forget it.

Mount of Olives.

Passing along a small bridge thrown over the Kedron, the Mount of Olives next presents itself. About half way towards the summit, there are several grottoes excavated labyrinthically in the rock. Higher up is another cavern, or subterraneous church, as it is now formed, consisting of several arched vaults, where the apostles composed the creed bearing their name; but this is almost filled with rubbish. About fifty yards farther, the spot is pointed out where Christ looked down upon Jerusalem in grief, and pronounced that ever memorable prophecy which has been so awfully and strikingly fulfilled. On the top of the Mount are the remains of a small church or chapel, in the octagon form, with a cupola, denominated the Ascension. This was built by Helena. Here there is shown the impression of the left foot or sandal of a man, which is ten inches in length and four in breadth, made on a rock or stone, said by the guides to be that of Christ, when his foot last touched the earth, though of course this is one of those modern inventions which prevail throughout the country.

Garden of Gethsemane.

The garden of Gethsemane, of all gardens in the world the most hallowed and interesting, is situated at the foot of the Mount, and near the brook Kedron. It is a piece of ground, about the third part of an acre in extent, surrounded by a coarse loose wall of a few feet in height. There are seven olive trees of enormous magnitude remaining, and separate from each other, said to have been in existence since the time of our Lord; they are highly venerated by the Christians, who consider any attempt to cut or injure them as amounting to an act of profanation. Should a Catholic be known to pluck any of the leaves, it subjects him to a sentence of excommunication from church privileges. Beads are made of the stone of the olive, and a string of them is the most sacred object than can possibly be presented to a traveller.

It was to this garden that Christ had occasion to resort with his disciples, to engage in devotional meditation, immediately before his death, and a view of it is calculated to impress the Christian mind with the deepest religious awe. At the upper end is the place where the apostles, Peter, James, and John, fell asleep during the passion of their divine Master, and, in the middle of the garden, the place where Judas betrayed him. Many other interesting places and grottoes are here pointed out, and among them is one which is supposed to be the scene of the agony and the bloody sweat.

Valley of Jehoshaphat.

After leaving the garden of Gethsemane, the traveller enters the valley of Jehoshaphat towards the south, on the eastern side of it. Among the first objects which are pointed out is the pit of Nehemiah, where the avenger of Israel discovered the sacred fire which had been concealed there during the Babylonish captivity. There is also shown the spot where Isaiah is said to have been sawn asunder. A little farther from the scene of the martyrdom, and on the same side of the valley, is the pool of Siloam, so particularly alluded to in Scripture, the water of which is of a brackish disagreeable taste, and flows several miles distant under the city of Jerusalem, and is emptied here into a sort of basin enclosed by a wall. At a short distance from, and over against the pool, is the "Mountain of Offence," as it is termed, where Solomon committed acts of idolatry, by offering sacrifices to the gods of the Moabites and other nations. Near the foot of it, the Field of Blood is shown, where Judas hanged himself; and beyond it two massy pieces of antiquity, one of which is named the Tomb of Zechariah, and the other that of Absalom, formed in an extraordinary manner out of the natural rock, about eighteen feet in height, and ornamented with some columns of architecture, after the Ionic order, hewn in the same entire stone, supporting a cornice over which rises a pyramidal roof. The latter, since Absalom was not supposed to be buried in the valley, is conjectured to have been formed during the life of that prince. Such is the antipathy of the Jews to this monument, that it is their practice in passing to throw stones against it, as a mark of their reprobation of the unnatural rebellion of Absalom against his father. Near it is the sepulchre of Jehoshaphat, which gives the name of the valley. It is a cavern which is more commonly called the Grotto of the Disciples, from an idea that they went frequently thither to be taught by their divine Master. The front of this excavation has two Doric pillars of small size, but of just proportions. In the interior are three chambers, all of them rude and irregular in their form; in one of which were several gravestones, removed, we may suppose, from the open ground for greater security. Like all the rest, they were flat slabs of a long shape, from three to six inches in thickness, and evidently a portion of the limestone rock which composes the adjoining hills.

Chateaubriand is of opinion, that, except the pool of Bethesda at Jerusalem, we have no remains of the primitive architecture of its inhabitants. The tombs in the valley of Jehoshaphat display an alliance of Egyptian and Grecian taste, mixed with the peculiar style of the Hebrews. In the valley of Jehoshaphat the Jews have a place of sepulture, which contains a number of gravestones, and to which those who reside in Jerusalem are in the habit of going in procession at certain seasons, for the purpose of observing a religious festival in memory of the dead. There still exists a strong desire in this people to mingle their dust with the ashes of their fathers, and many of them, as well as Christians, entertain the fantastical belief that the valley of Jehoshaphat is to be the scene of the final resurrection. With respect to its present aspect, Chateaubriand beautifully observes, "What with the sadness of Jerusalem, from which there ascends no smoke nor issues any sound—the solitude of the mountains, in which we perceive no living being—and the confusion of the tombs, all broken, shattered, and half open—one could almost believe that the trump of doom had already sounded, and that the dead had begun to rise in the valley of Jehoshaphat."

Besides the places already described in and about the city which tradition has hallowed, are the following:—Beneath the gate of Bethlehem is the spot where Bathsheba was bathing when David beheld her from the roof of his palace, and the present tower of the king is built upon the site of the ancient palace. A small distance within the gate of St Stephen is the pool of Bethesda. It is one hundred and fifty feet long, and forty broad. The sides are walled with large stones joined together by iron cramps, and covered with flints embedded in a substance resembling plaster. Here the lambs destined for sacrifice were washed, and here the Saviour said to the paralytic man, "Take up thy bed and walk." It receives a melancholy interest from the consideration that it is the only remnant which remains of Jerusalem as it appeared in the days of Solomon. A wretched street leads from this to the governor's palace,

a spacious and rather ruinous building of Roman architecture. It contains some good apartments, the windows of which command an excellent view of the Mosque of Omar and its large area. In this palace the monks point out the room where Christ was confined before his trial; and at a short distance is a dark and ruinous hall, shown as the judgment-hall of Pilate. You then proceed along the street where Christ bore his cross, in which, and in the streets leading up to Calvary, are the three places, where, staggering under the weight, he fell. These are marked by three small pillars laid flat on the ground. The very house of the rich man also is here, and the spot where Lazarus sat at his gate. A pilgrim who comes to the city must set no bounds to his faith, as he is shown the place where the head of Adam was found, the rock on which the martyr Stephen was stoned, and the place of the withered fig-tree, with the milk of the Virgin Mary, and some of the tears that St Peter wept on his bitter repentance.

In the neighbourhood of Jerusalem, the two chief places of interest are Bethany, lying in a northerly, and Bethlehem in a southerly, direction from the city.

BETHANY.

After leaving Jerusalem by the gate of St Stephen, crossing the valley of Jehoshaphat, and passing the garden of Gethsemane and the Mount of Olives, the pilgrim arrives at the village of Bethany, situated about two miles from the city, where Jesus once resided, and where he appeared to his disciples after his resurrection. On the road, we meet with the village of Bethpage, now a heap of ruins. Bethany is both small and poor: it is, however, beautifully situated, and the view just above it is very magnificent. The cultivation of the surrounding soil is much neglected. The object which first strikes the traveller, is a ruinous castellated pile, which it is said Lazarus occupied. This, however, is only one of those oral legends, which, being manifestly of such a nature that the alleged fact could never have been ascertained, only affect the traveller with a painful sense of distrust, as he passes through this otherwise interesting country. Not far distant are the ruins of a building, said to have been the house of St Mark. A little to the right are the vestiges of the habitation of Mary Magdalene. But by far the most interesting object is the tomb of Lazarus. The traveller first descends to a cave, probably from fifty to sixty feet under ground, and lands on a small quadrangular space, where there appears to have been a communication with a church adjoining, which is now built up and converted into a mosque. In the wall of this apartment there is an aperture of about three feet in breadth, formed by the raising of a large stone, as if by some convulsion of nature, and which conducts into an arched vault, said to be the spot where the body was laid. The vault measures about fourteen feet in length, ten in breadth, and eight in height. With respect to the identity of the tomb, Mr Carne observes, "Its identity cannot be doubted—the position of Bethany could never have been forgotten—and this is the only sepulchre in the whole neighbourhood;"—reasoning which appears by no means conclusive.

BETHLEHEM.

Bethlehem, as being the birthplace of Christ, is one of the most interesting places in the Holy Land. The road leading to it is extremely rocky and barren, only diversified by some cultivated patches bearing a scanty crop of grain, and a profusion of wild flowers. On the way lie the ruined Tower of Simeon, who, upon beholding the infant Messiah, expressed his willingness to leave this world; the monastery of Elias, in which there is said to be a large stone, still retaining an impression of his body; and the tomb of Rachel, rising in a rounded top, like those erected to the memory of a Turkish sultan. Farther on is the well of which David longed to drink, and of which his mighty men, at the imminent risk of their lives, procured a supply. To distinguish this town from another of the same name of the tribe of Zebulun, the Bethlehem we now approach is usually distinguished by the addition of Ephrata, or by a reference to the district in which it is situated. It is a small village, situated upon a mountain, and surrounded with gardens of fig-trees and olives. The houses are very humble, and flat on the roof, with stairs on the outside.

The principal buildings in Bethlehem are the convent and church of the Franciscans, which cover the supposed spot of the nativity. From the alteration of the surface caused by the building, this celebrated spot is now a species of vault or subterraneous chapel, called the Chapel of the Nativity. Before the altar in this underground chapel, there are several massy silver lamps kept constantly burning; and the spot where it was said Christ was born, is marked with a star, formed of white marble, inlaid with jasper, and surrounded with a radiance or glory. On this there is encircled the following inscription:—

Hic de Virgine Jesus Christus natus est.

[Here Jesus Christ was born of the Virgin Mary.]

To the right of this is shown the place where stood the manger in which he was laid. It appears to be cut out of the natural rock, and lined with marble. Lamps of silver are always kept burning before it. A narrow passage leads from this chapel into that of the innocents, who were slain by the command of Herod, where is a cell, in which, say the monks, St Jerome made a translation of the Bible. A short distance from the convent is a grotto, where, according to tradition, the mother of Jesus concealed herself and child, whilst Joseph was making arrangements for their flight!

Four miles to the south of Bethlehem, in a most secluded situation in the middle of mountains, are situated the celebrated pools or fountains of Solomon. These are three in number, of a quadrangular form, cut out of the living rock. About half a mile below there is a deep valley, embosomed in high hills, where it is said the gardens of Solomon were laid out.

From the top of the church at Bethlehem there is a fine prospect of the surrounding country, extending to Tekoa on the south, and En-gedi on the east. In the latter place is the grotto or cave of Adulam, where David cut off the skirt of Saul's garment. Between this point and Jerusalem are several small detached towers, of a square form, built in the midst of vineyards. These are for the accommodation of watchmen appointed to guard the produce from thieves and wild beasts, as alluded to by the evangelist St Mark.

About twenty miles south from Bethlehem is Mount Hebron, with the town of that name, one of the old cities of Canaan, but now containing only 700 or 800 Arab families. The present inhabitants are the wildest and most lawless, and desperate people of the Holy Land. The principal mosque is said to contain the tombs of Abraham, Isaac, and Jacob; being in the possession of bigoted Mussulmans, no examination can be made of these supposed objects of antiquity.

CAVE OF JEREMIAH.

The central district of Palestine, northward from Jerusalem, contains a few objects of interest to travellers. The first which attracts their attention is the cave of Jeremiah, situated at a short distance from the gate of the Holy City. The bed of the prophet is shown in the form of a rocky shelf, about eight feet from the ground; and the spot is likewise pointed out on which he is understood to have written his book of Lamentations. At a little distance from the city stand the sepulchres of the kings, connected with which there still prevails some obscurity. But whoever was buried here the place discovers so great an expense, both of labour and treasure, that we may well suppose it to have been the work of kings. It is approached on the east side by an entrance cut out of the rock, which opens into a court of about forty paces square. On the south side is a portico nine paces long and four broad, likewise hewn out of the living rock, and having an architrave running along its front adorned with sculpture. In the interior there are six or seven rooms in which stone coffins are exhibited.

BEER, LEBONAH, AND THE MOUNT OF GERIZIM.

The next object of importance which we meet with is a village supposed to be the Mickmash alluded to in Scripture. It is at present distinguished by the name of Beer, signifying a well, and adopted, most likely, from a delicious spring of water flowing through it; near to which are the ruins of a church, built in commemoration of the missing of Jesus by his parents, on their way home from Jerusalem, when it was discovered that he had remained in the temple with the expounders of the law. It was to this place, also, that Jotham had recourse in order to escape the fury of his brother. Beyond this hamlet, at the distance of about four hours' walk, is Leban, called Lebonah in the Bible, a village situated on the eastern side of a delicious vale. The road between these two places is carried through a wild and very hilly country, destitute of trees or other marks of cultivation, and rendered almost totally unproductive by the barbarism of the government. In a narrow dell, formed by two lofty precipices, are the ruins of a monastery, being in the neighbourhood of that mystic Bethel where Jacob enjoyed his celestial vision. We next arrive at the well of that patriarch, the scene of the conference between our Saviour and the woman of Samaria. Over this fountain Helena erected a large edifice, of which, however, almost nothing now remains. Near this is the narrow valley of Shechem, the Sychar of Scripture, overhung on either side by the two mountains Gerizim and Ebal, memorable as being the theatre on which was pronounced the sanction of the divine law. The Samaritans have, as is well known, a place of worship on Mount Gerizim, where at certain seasons they perform the rites of their religion. According to their version of the Pentateuch, it was here that the Almighty commanded the children of Israel to set up great stones covered with plaster, on which to inscribe the body of their law; to erect an altar to offer peace-offerings; and to rejoice before the Lord their God. In the Hebrew edition, Mount Ebal is said to have been the scene of these pious services—a variation which the Samaritans ascribe to the malice of the Jews. In the vicinity of the town is a small mosque, which is said to cover the sepulchre of Joseph, and to be situated in the field bought by Jacob from Hamor, the father of Shechem, as is related in the book of Genesis.

NABLOUS OR SHECHEM, AND SAMARIA.

Penetrating farther northwards, we arrive in a rich and fertile district, in which is situated Nablous, the ancient Shechem, and at present one of the most flourishing towns in the Holy Land. It has a very imposing appearance when viewed from the surrounding heights, and looks as if it were embosomed in a delicious paradise. The population, who are principally Mahommedans, have been estimated at 10,000, but this Mr Buckingham thinks an exaggeration.

The Samaritans do not exceed forty in number. They have a synagogue, where divine service is performed every Saturday. Four times a-year they go in solemn procession to the old temple on Mount Gerizim, on which occasion they assemble before sunrise, and read the law till noon. They have but one school in Nablous where their language is taught, though they take much pride in preserving ancient manuscripts of their Pentateuch in the original character. Mr Connor saw a copy which is reported to be 3500 years old, but he was not allowed to examine nor even to touch it. The events transacted in the field of Shechem render the localities contiguous to this city peculiarly interesting. Here stands the well of Jacob, and here the sons of the patriarch "drove their flocks a-field," and here they said to the Ishmaelites their brother Joseph, the future all but potentate of the greatest kingdom then upon the face of the earth. Here, as of old, the shepherds graze their flocks upon the hills of Samaria, and the Ishmaelites come from Gilead, "bearing spices, and balm, and myrrh"—so enduring are the customs and manners of the east.

A few miles beyond Nablous, and about forty from Jerusalem, is situated the town of Samaria. The situation is extremely beautiful, and naturally strong, occupying the summit of a hill, encompassed all around by a deep valley. But the city which Herod adorned with princely buildings is now a mere village, small and poor, exhibiting only the miserable wreck of former greatness. Here John the Baptist was decapitated, and the Empress Helena erected a church over the place where he pined and suffered; but it has shared the fate of the rest of the city, being now a mere ruin. The prison where the holy blood of the desert-bred was spilled, is, however, pointed out by the Turks, who hold it in high veneration.

THE DEAD SEA.

This extensive sheet of water lies in an easterly direction from Jerusalem, and also from Bethlehem. In proceeding towards it from the latter place the traveller goes through a vale where it is said Abraham was wont to feed his flocks. This pastoral plain is succeeded by a range of mountainous and barren ground. Descending from this, two lofty towers rise from a deep valley, marking the site of the Convent of Santa Saba, a very ancient church. Its situation is dreary, being built amidst precipices on the brink of a deep and gloomy dell, where the brook Kedron flows.

In advancing, the country still presents a desolate aspect. The road at length seeks a lower level, and approaches the rocky border which bounds the valley of the Jordan; when, after a toilsome journey of ten or twelve hours, the traveller at last beholds the Dead Sea, and the line of the river; the landscape, however, is by no means grand or prepossessing. Two long chains of mountains run in a parallel direction from north to south, without breaks and without undulations. The eastern or Arabian chain is the highest; and when seen at the distance of eight or ten leagues, it resembles a prodigious perpendicular wall. Not one summit, not the smallest peak, is distinguishable; only slight inflections are here and there observed, as if the hand of the painter who drew this horizontal line along the sky had trembled in some places. The mountains of Judea form the range on which the observer stands as he looks down on the lake Asphaltites; it is less lofty and more unequal than the eastern chain, and also differs from it in its nature; exhibiting heaps of chalk and sand, which assume various bizarre forms. The Arabian side, on the contrary, presents nothing but bleak precipitous rocks, which throw their long and gloomy shadows over the water of the Dead Sea. Not a single blade of grass is to be found among these crags; every thing announces the country of a reprobate people, and well fitted to perpetuate the doom pronounced on Ammon and Moab. The valley embosomed in these two chains of mountains displays a soil similar to the bottom of a sea which has long retired from its bed—a beach covered with salt, dry mud, and moving sands, furrowed as it were by the waves. Vegetation is here in a deplorable state: there are a few dreary shrubs, with leaves covered with salt, and a bark which has a smoky smell and taste. Instead of villages, you perceive the ruins of a few towers. In the middle of this valley flows a discoloured river, which reluctantly throws itself into the pestilential lake by which it is engulfed. Its course amid the sand can be distinguished only by the willows and the reeds that border it; among which the Arab lies in ambush to attack the traveller, and to rend the pilgrim.

We now come to the lake itself, called in Scripture the Dead Sea; among the Greeks and Romans, Asphaltites; and among the Arabs, Bahr Lout, or the Sea of Lot. Considerable diversity of opinion has prevailed, both among the ancients and moderns, regarding the exact dimensions of this lake, which as yet are probably not accurately ascertained. Mr Carne says, its length may probably be about sixty miles, and its average breadth eight. Mr Banks, however, who took observations from several neighbouring heights, says that its length exceeds [illegible]

This discrepancy places the inaccuracy of travellers, with regard to their topographical descriptions of Palestine, in a very strong point of view. It is surrounded on the east by lofty hills, exhibiting rugged and frightful precipices; on the north it is bounded by the plain of Jericho, through which it receives the river Jordan. Other streams are discharged into it; and there being no visible outlet, while the banks are not overflowed, some have thought there is a subterraneous channel communicating with the Mediterranean; others readily account for the phenomenon, in the evaporation which necessarily takes place in a hot climate. This lake is clear and limpid, resembling the colour of the sea. Its waters are in general fatal to animal life, nor do vegetables flourish in their immediate vicinity. The fishes carried hither by the river Jordan, according to the concurring testimony of travellers, speedily perish; but the latest observers affirm that there are some small ones in the lake peculiar to itself, as also that a few inferior vegetables may be seen in it.

Travellers on bathing in the lake find their faces covered with a thin crust of salt, and the stones which the water occasionally covers, are encrusted with the same substance. From whatever cause, the water is different from that of other lakes or seas. On being analysed, it is found to have a greater specific gravity, or power of buoying up bodies, than any other water. It holds in solution muriate of lime, muriate of magnesia, muriate of soda, and sulphate of lime; of all these there are 24 grains in 100 grains of water.

Great quantities of asphaltum, or mineral pitch, are always seen floating on the surface of the Dead Sea, and it is driven by the winds to the banks on the east and west; but the statement that a pestilential effluvium hovers over it is doubtful. Mr Carne informs us that there is nothing of the kind. The neighbourhood of the lake abounds with volcanic products; and although eruptions have ceased for many centuries, earthquakes are still common in Syria and Palestine.

The Dead Sea is associated with that dreadful catastrophe recorded in Scripture, the destruction of Sodom and Gomorrah. With respect to the agents employed for executing the purpose of divine vengeance, various conjectures have been hazarded—some suppose that the great cities were swallowed up by a volcano. The opinion of Chateaubriand, who had carefully examined several volcanoes, is decidedly opposed to this theory. The learned Frenchman inclines to the opinion of Michaelis and Busching, that Sodom and Gomorrah were built upon a bituminous mine; that lightning kindled this combustible mass; and that the cities were engulfed in this subterraneous conflagration. Malte Brun ingeniously supposes that the stones of which the towns themselves were built might be bituminous, and thus have been kindled by the fire of heaven. These views appear very plausible, when taken in connection with the Mosaic account of the place, that the vale of Siddim, which is now occupied by the Dead Sea, was full of "slime pits," or pits of bitumen. There can be no doubt, however, that combustible matter descended from heaven upon the devoted cities of the plain, for the language of the Scriptural account is precise and explicit: "The Lord rained upon Sodom and Gomorrah brimstone and fire from heaven." According to Strabo, there were thirteen towns swallowed up in the lake Asphaltites; Stephen of Byzantium reckons eight; the book of Genesis, although it names five as situated in the vale of Siddim, relates the destruction of two only; four are mentioned in Deuteronomy, and five are noticed by the author of Ecclesiasticus. A considerable difference of opinion exists respecting the probable outlet of the waters of the Jordan, previous to the catastrophe which destroyed Sodom and Gomorrah, and created the Dead Sea on their site. Burckhardt and others allege, that the Jordan must have proceeded along the plain of Sodom, and pursued a course through the wilderness to the Gulf of Akaba, or eastern limb of the Red Sea; indeed ther probable outlet could be assigned. Other travellers who have scrupulously examined the dis and taken its levels mathematically, declare that surface of the Red Sea is several hundred feet b the level of the Gulf of Akaba, and much more b that of the Mediterranean. If this be the case land on which the Dead Sea rests, and also the pr termination of the Jordan, must have been sunk at 1000 feet on the occasion of the awful catastrophe w laid the "cities of the plain" in ruins, and covered with a waste of bitter waters.

THE RIVER JORDAN.

The river Jordan, which flows into the Dead S its northern extremity, rises at the foot of the m tains of Lebanon, and has altogether a course of miles. For the last two or three miles, it runs bet perpendicular banks of sand, from five to ten feet and here the river is about thirty paces broad. A miles from its mouth, on the right side, and at a distance from the stream, is the site of the an Jericho, now consisting only of a few miserable and a watch-tower. At this point of the river is a where the Israelites crossed from the Arabian sid Palestine, under the command of Joshua. Passin the vale of the Jordan, for a distance of ninety o hundred miles, with the land of Gilead, as it is c on the right, the traveller arrives at the Lake of G sareth, near which are a number of places ment in the narrative of Christ's ministrations.

LAKE OF GENESARETH.

This sheet of water, which is an expansion o Jordan, passes under various names from the s writers, such as the Sea of Galilee, Lake of Tib and Lake of Geneser or Genesareth. The Jordan enters at the northern and flows out a southern extremity, and its course is visible all th through. The range of mountains forming its ea shore, is very lofty, and their steep and rocky side barren; the western shore, where the town stan lower; the hills are more picturesque, and divid sweet valleys clothed with verdure, but destitu trees. With respect to the size of the lake, we choose again amongst conflicting statements. It s to be about fifteen miles in length and five in b The waters are perfectly sweet and clear, and th are said to be of a delicious flavour.

It is almost unnecessary to remind the reader this lake and neighbourhood were the scene of important events recorded in the New Testament. I it will be remembered, Christ embarked in a shi go to different places about its borders, in the p cution of his errands of mercy, and from which h structed the multitude who had assembled on the s

Capernaum lies at the upper end of the lake, a now called Talhewm, or Tel Hoom. It is nothing than a station of Bedouins, but there are traces former importance. The foundations of a magnif but now much dilapidated edifice can still be trac

Tiberias, which makes a conspicuous figure i Jewish annals, is situated on the western side, a the only place on the sea of Galilee retaining any n of its ancient importance. It is understood to the ground formerly occupied by a town of a remoter age, and of which some traces can still b tinguished. Tabaria, as it is now denominated, ha form of an irregular crescent, and is enclosed to the land by a wall, flanked with circular towers. nearly north and south, along the edge of the lake has its eastern front so close to the water, on the of which it stands, that some of the houses are w by the sea. The whole does not appear more th mile in circuit, and cannot, from the manner in w they are placed, contain above 500 separate dwel Here there are a mosque and two Jewish synago also a Christian place of worship, called the Hou Peter, which is thought by some to be the oldest b ing used for that purpose in any part of Palestine. structure is of very ordinary description; but it de

so small interest from the popular belief that it is the very house which Peter inhabited at the time of his being called from his boat to follow the Messias. The population of the town does not now exceed 2000. Of these, about one-half are Jews; the rest are Mahommedans, with the exception of a few of the Christian creed. The warm baths, which have given celebrity to that neighbourhood, are still found at the distance of between two and three miles southward from the town.

MOUNT TABOR.

An almost uninterrupted ascent, in a south-westerly direction, conducts from Tiberias to Nazareth. On this route, we have on our left Mount Tor, or Tabor. This mount, which is classed in Scripture with Hermon, and is of a sugar-loaf shape, stands apart from the neighbouring mountains, is at one end of the great plain of Esdraelon. It may be ascended on all points, excepting towards the north, where it is rugged. There is not, perhaps, to be found, in the whole compass of the globe, one spot, from which a believer in the gospel can possibly enjoy a more sublime or glorious prospect, than from the summit of Mount Tabor. In the first place, there is presented to view an extensive plain, on one side of which, on the left hand, are the mountains of Samaria, towards Jerusalem; on the other, to the right, those about Nazareth, especially the memorable hill from which the Jews attempted to precipitate Christ. At the opposite extremity of this plain, is the top of Mount Carmel, washed by the ocean. In another direction, we see Hermon in its lofty dignity; Endor, and Nain, with the mountains of Gilboa; the valley of Jordan; the spacious plains of Galilee, with its sea of Genesareth, and its enclosure of mountains; Dothan, where Joseph was sold, with its rivers, valleys, and little hill; and the village of Saphet, anciently called Bethulia, on an eminence, and presumed to have been the point of elevation alluded to by Christ in his sermon on the mount, from which it is also remarkably conspicuous, and not at a great distance. Again, the sublime height on which he delivered this memorable oration; the route to Damascus; lastly, Mount Lebanon, towering with prodigious alpine dignity in the background.

Different opinions have been entertained by writers with regard to the extent of ground on the summit of Tabor, and the cultivation of it. Taking the whole into calculation, it may be nearly two miles in diameter. To the west, there are masses of scattered ruins. At one period, a governor of Galilee surrounded the top of it with walls, which is confirmed by the scattered fragments still to be seen. St Helena, also, in prosecution of her zeal in the cause of Christianity, founded two monasteries, one to the memory of Moses, and the other of Elias. Various historical incidents are connected with this mountain. Here it was that Barak, descending with his ten thousand men from Tabor, discomfited Sisera and all his chariots. In the same neighbourhood, Josiah king of Judah fought in disguise against Necho king of Egypt, and fell by the arrows of his antagonist, deeply lamented. Vespasian reviewed his army in the same great plain. It has been a chosen place for encampments in every contest carried on in the country, from the days of Nebuchadnezzar king of the Assyrians, down to the disastrous invasion of Napoleon Bonaparte.

NAZARETH.

A short way to the north-west of Mount Tabor is situated the village of Nazareth, on the western slope of a delightful valley, and encompassed by rocky mountains; the distance from Jerusalem is about one hundred miles. The place is properly named Nazareth of Zebulun. The inmates of a convent at the eastern extremity of the village, conduct travellers to a number of spots in the neighbourhood of scriptural interest, but greatly changed in their appearance in modern times. The first thing to which attention is directed is the church belonging to the convent, which is rather elegant, and is erected over the grotto or cave where Mary took up her abode. It has no other roof than that which is formed of the natural rock, and is in the shape of a cross.

Among many pictures which adorn this church, there is a pretended likeness of Christ.

The second object shown is the shop where Joseph worked; it is now used as a place of worship. Over the altar, he is represented with the implements of his trade, holding our Lord by the hand, as if in the act of imparting the knowledge of his vocation.

Thirdly, a chapel, in the centre of which is an enormous stone, about nine feet in length, and six in breadth, on which it is affirmed that Christ sat and ate with his chosen few.

Fourthly, the synagogue where Christ, agreeably to his practice, read to the Jews, from the sacred volumes, on the Sabbath.

Fifthly, near the town is pointed out a hill, from which, disregarding the sanctity of that day, they threatened to throw him, in consequence of the dissatisfaction which his addresses had given.

And, lastly, a well of the Virgin, which supplies the inhabitants of Nazareth with water. Mr Carne says, the population may amount to about 1200, and are mostly Christians.

After crossing the plain of Esdraelon, we come to Mount Hermon, the dew of which is so beautifully alluded to by the Psalmist. Near this place stands Nain, which is so called from its pleasant situation, where the widow's son was restored to life. About two miles from Nain, is seen Endor, where the sorceress resided who was consulted by Saul, and in the vicinity are the mountains of Gilboa, where the forces of Israel were collected.

A few miles northward from Nazareth, is

CANA OF GALILEE.

This village, which was the scene of the earliest miracle performed by our Lord (the conversion of the water into wine at the marriage feast), is pleasantly situated on a small eminence in a valley, and contains 200 or 300 inhabitants. Many pots, answering to the description given by the Evangelist, are found lying about amongst the ruins; from which it would appear evident, that the practice of keeping water in large stone pots, each holding from eighteen to twenty-seven gallons, was once common in the country. Near the bottom of a field, which is said to be that in which Christ plucked the ears of corn upon the Sabbath, stands the Holy Mount, which has been so eminently distinguished as the spot from whence the multitudes were addressed. It has an elevation of from 200 to 300 feet.

The landscape, which stretches from the lake of Tiberias to the sources of the Jordan, is in many parts uncommonly fine, presenting luxuriant crops, thriving villages, and other tokens of security and comfort. The mountains that terminate the prospect are magnificent, some of them being covered with perpetual snow.

SAPHET, SEPHOURI, AND ZEBULUN.

The only town of consequence between the ruins of Capernaum and the alpine range of Hermon and Djibbel el Sheik, is Saphet or Zaffad, being one of the four cities consecrated by the religious veneration of the Hebrews. According to Burckhardt, it stands upon several low hills that divide it into quarters, the largest of which is occupied by Jews. The whole may contain 600 houses, of which 150 belong to the people just named, and nearly as many to the Christians. The summit of the principal eminence is crowned with an ancient castle, part of which is regarded by the descendants of Israel as being contemporary with their ancient kings. The Jews have here seven synagogues, and a sort of university for the education of their rabbis. Their attachment to this place arises especially from the traditionary belief, that the Messias is here to reign forty years before he assumes the government at Jerusalem. From Nazareth to Acre we proceed over a barren rocky tract of country; on the way we meet with Sephouri or Sepphoris, the Zippor of the Hebrews, and the Diocesarea of the Ro-

mans, once the chief town and bulwark of Galilee. The remains of its fortifications exhibit one of the works of Herod, who, after its destruction by Varus, not only rebuilt and fortified it, but made it the principal city of his tetrarchy.

Its chief celebrity is connected with the tradition that it was the residence of Joachim and Anna, the parents of the Virgin Mary. Constantine built a magnificent church over the spot where the devout couple lived. The vale of Zebulun divides the above village from the ridge of hills which look down on Acre and the shores of the great sea. This plain every where presents the most beautiful scenery. On the road, various ruins occur which exercise the ingenuity of the antiquarian traveller. All remains of the strong city of Zebulun have disappeared, and its admirable beauty, rivalling that of Tyre, Sidon, and Berytus, is now sought for in vain among Arab huts and heaps of rubbish. We shall now proceed in a westerly direction to the coast of the Mediterranean, to describe those points of interest lying to the north of Acre.

TYRE.

Tyre (now called Tsour), which is situated on the coast about twenty miles north from Acre, and anciently belonged to the Phœnicians, is renowned in Scripture as a mighty mercantile stronghold, encompassed with walls and towers. Perhaps, of all other maritime cities in the globe, this was the most highly renowned for riches and commerce, since its very merchants were declared to be as princes, and "every deck a throne." A most interesting description of the trades carried on within its walls, has been transmitted to us in the 27th chapter of Ezekiel. It was not, however, merely in a commercial point of view that it was represented to the world at large as an object of wonder and admiration. Among the variety of trades exercised in this city, that of dyeing was most distinguished, on account of the beautiful purple tint, which poets have celebrated as a chief ingredient in the magnificence of the vestments worn by the principal inhabitants. During the time of our Saviour, considerable importance must have been attached to the city, as it is frequently alluded to, with its neighborhood. Tyre was besieged and taken by Alexander the Great, after whose death it began to recover, and maintain a commercial character. It afterwards submitted, first, to the Roman, and afterwards to the Mahommedan yoke, under the power of which it now remains. It was enclosed with walls, which originally must have been of great strength, furnished with towers, having holes or apertures for making observations, part of which still remain. In the present day it exists as a small decayed town at the outer extremity of a low sandy peninsula, and a recent traveller mentions that he saw only a single boat in its harbour.

SIDON.

Sidon, or Zidon, called by the Arabs Tsaida, is situated on the coast at about twenty miles northward from Tyre. It owes its name to the eldest of the sons of Canaan, and was comprehended under the "lot," or possessions, formally assigned to the tribe of Asher. It appears to have been higher in point of antiquity than Tyre, although both have been classed in the character of sisters, arising, most likely, from their near contiguity, and publicly considered as a city of large extent and importance, since it has frequently been mentioned in Scripture by the title of "Zidon the Great." The inventions of the alphabet and architecture, the use of glass, and skill in casting and sculpture, have been celebrated; its Tyrian rivals dexterity in dyeing wool and hard crystal the subject matter in the page of history to the latest period of time. The coarse red pigments of this people were almost as lucrative as they were extensive; and it was likewise celebrated for its maritime enterprise.

Sidon is now a small town, rising gradually from the sea-shore, very pleasantly situated, and surrounded with rich gardens. The streets are excessively narrow, many of them under archways, as at Jerusalem: the inhabitants mated at about 7000, of whom 2000 are Chris have places of worship; the Jews, also, wh calculated at 200, have a synagogue. Con small extent, the trade of this place is co particularly in silk.

The next object of importance in a north tion is

MOUNT LEBANON,

"Whose head in wintry grandeur towers,
Whitened with eternal sleet;
While summer in a vale of flowers,
Is sleeping rosy at his feet."

This mountain has received the appellation o from the word Leban, signifying white, and, bability, from the snow which remains on during the whole year. It has afforded ma images and beautiful metaphors to the sacre Its cedars, alluded to in ancient prophecy, h ages been celebrated as fine objects. It may added, that, uniting so many qualities for buil of these trees were sent by King Hiram to S the erection of his temple.

The highest elevation of Lebanon is 9600 sides are still shaded with cedars, and beau thousands of rare plants.

THE DRUSES AND MARONITES.

The mountains of Lebanus and neighbou inhabited by two races, differing in religion ners, but similar in their love of indepen Maronites and the Druses. The country of t is called Kesraoun, the Castravan of the hi the crusades. It reaches from the river Ke Kelb. The Maronites, amounting to 120,000 villages and hamlets. The fervour and devo animate this people recall to us the ideas of tive church. An imposing superstition has c a cedar forest which is said to have furnished of Solomon's temple. Only twenty large ceda and this old vegetable race verges fast to its Every year, on transfiguration day, the G Armenians, and the Maronites, celebrate a n altar of rough stones raised at the roots of ti rable trees.

The Druses, also 120,000 in number, live t of the Maronites. Their country has severa sions, differing from one another in their soil a tions. It is by religious peculiarities that t is separated from the other inhabitants of Sy believe in one God, who, for the last time, sh self in human form in the person of Hakem, Egypt, in 1030. Persuaded that all other s belief will finally be united in that which the they regard them all with equal indifference, the Christians have considered them as entit marked contempt for the Mahommedan relig cent travellers have described the Maronites a as an inoffensive primitive people.

In a northerly direction from Sidon, the co any consequence on the Mediterranean as Bei

BALBEC AND DAMASCUS.

Having reached Mount Lebanon, at the extremity of Palestine, travellers generally sp days in making a journey to Balbec and I both lying beyond the frontier of the Holy L soil of great historical interest. Balbec, th Heliopolis, and once distinguished for its Grecian and Roman architecture, is now a ruins. These, however, are of the most m solid, and not of delicate columns, façades and other elegant kinds of destroyed buildings is now uninhabited, except by wandering Ar masses, situated near the confluence of the riv and Pharphar of Scripture (see map), is a town in Syria, built in the eastern style, and

* For an account of the ruins of Balbec, see Lamarth in the Last, page 113: People's Edition.

ounding country, is again in the possession of the an.

amascus is enlivened by the bustle of commerce, the passage of the caravans to Mecca. The great et which crosses it presents two rows of shops, in h the riches of India glitter along with those of ope. Damascus is seven miles in circumference, at present the population may amount to 100,000. private houses in Damascus, simple in external arance, exhibit in the interior all the splendour d gance of a refined luxury; great magnificence so displayed in the mosques, the churches, and the e-houses. The large mosque is a fine and spacious ding, but no traveller is permitted to enter. The n Verdy, or Coffee-House of Roses, is considered ne of the curiosities of the Levant. Various places ciated with events mentioned in Scripture, are ted out in the city and neighbourhood. The street, called Straight, is that where St Paul is, with reason, to have lived. It is as straight as an arrow, a e in length, broad, and well paved. A lofty window, ne of the towers to the east, is shown as the place re the apostle was let down in a basket; and in the r to Jerusalem is the spot where his course was ested by the light from heaven.

ARABIA PETRÆA.

rabia Petræa, or Arabia the Rocky, is the most therly part of the peninsula of Arabia, and includes territory lying between the Mediterranean and the upper extremities of the Red Sea. These extremities form two gulfs—the Gulf of Suez, which is the est, and the Gulf of Akaba. The Gulf of Suez is acent to Egypt, and betwixt it and that of Akaba re is an angular tract of country, in which is situated wilderness of Sinai. The whole of this territory, m the borders of Egypt to near the Dead Sea in lestine, and from the Red Sea to the Mediterranean, ittle else than an universal desert of rocky mountis and sandy plains, almost destitute of any settled man habitations, and inhabited only by roving bands Arabs or Bedouins (children of the desert), whose nd is against every man, and every man's hand in-t them. Anciently, the country, which was called its more northerly part, the land of Edom or mea, was mostly fertile and productive, but by the roachments of the sands of the deserts and the deson which has otherwise spread over it, the land is erally barren, and mostly in the condition of a wilness. Till this hour, the curse of God, as enunci-l by the prophet Isaiah, rests upon it—"From genetion to generation it shall lie waste; none shall pass ough it for ever." With the exception of a few ach and English travellers who have within the twenty years passed through Idumea, from Akaba Jerusalem, the prophecy has been fulfilled.

ccording to the accounts of recent travellers, noing can exceed in rugged grandeur the desolate ion of Sinai and Mount Horeb. Rocks piled on ks to an immense height, precipitous cliffs, and e desolate valleys, fill up the melancholy scene. On face of Sinai, a fortified monastery is placed, for the ommodation of Christian pilgrims and travellers. e ascent of the mountain commences above the monastery, and in this direction it was climbed by Mr phens, who reached the top with some difficulty, and around him a terrific solitude, a perfect sea of olation. "Not a tree, or shrub, or blade of grass, n be seen upon the bare and rugged sides of immurable mountains, heaving their naked summits to skies. The level surface of the very top or pinnacle, bout sixty feet square. At one end is a single rock ut twenty feet high, on which, it is said the monk [my nductor] the spirit of God descended, while, in the ion beneath, his favoured servant [Moses] received e tables of the law. The ruins of a church and conent are still to be seen upon the mountain, to which, fore the convent below, was built, monks and hermits used to retire, and, secluded from the world, sing the praises of God upon his chosen hill. Near this, also in ruins, stands a Mahommedan mosque—for on this sacred spot the followers of Christ and Mahommed have united in worshipping the true and living God."

The route from Sinai towards the land of Edom is by way of Akaba, a small fortified town at the head of the Gulf of Akaba, or Elanitic branch of the Red Sea. The journey is through a rocky desert, "with here and there (says Mr Stephens) a fertile spot, near some fountain or deposit of water, known only to the Arabs, capable of producing a scanty crop of grass to pasture a few camels and a small flock of sheep or goats. There the Bedouin pitches his tent, and remains till the scanty product is consumed; and then packs up his household goods, and seeks another pasture-ground. The Bedouins are essentially a pastoral people; their only riches are their flocks and herds, their home is in the wide desert, and they have no local attachments; to-day they pitch their tent among the mountains, to-morrow in the plain; and wherever they plant themselves for the time, all that they have on earth, wife, children, and friends, are immediately around them. In fact, the life of the Bedouin, his appearance and habits, are precisely the same as those of the patriarchs of old. Abraham himself, the first of the patriarchs, was a Bedouin, and 4000 years have not made the slightest alteration in the character and habits of this extraordinary people. Read of the patriarchs in the Bible, and it is the best description you can have of pastoral life in the East at the present day.

Akaba (continues this writer) is situated at the foot of the sandstone mountains, near the shore, and almost buried in a grove of palm-trees, the only living things in that region of barren sands. It is the last stopping place of the caravan of pilgrims on its way to Mecca, being yet thirty days' journey from the tomb of the Prophet, and, of course, the first at which they touch on their return. Except at the time of these two visits, the place is desolate from the beginning of the year to its close; the arrival of a traveller is of exceedingly rare occurrence, and seldom does even the wandering Bedouin stop within its walls; no ship rides in its harbour, and not even a solitary fishing-boat breaks the stillness of the water at its feet. But it was not always so desolate, for this was the Eziongeber of the Bible, where, 3000 years ago, King Solomon made a navy of ships, which brought from Ophir gold and precious stones for the great temple at Jerusalem; and again, at a later day, a great city existed here, through which, at this distant point of the wilderness, the wealth of India was conveyed to imperial Rome. But all these are gone, and there are no relics or monuments to tell of former greatness; like the ships which once floated in the harbour, all have passed away. Still, ruined and desolate as it is, to the eye of feeling the little fortress is not without its interest; for, as the governor told me, it was built by the heroic Saladin.

Standing near the shore of this northern extremity of the Red Sea, I saw before me an immense sandy valley, which, without the aid of geological science, to the eye of common observation and reason had once been the bottom of a sea or the bed of a river. This dreary valley, extending far beyond the reach of the eye, had been partly explored by Burckhardt; sufficiently to ascertain and mention it in the latest geography of the country as the great valley of El Ghor, extending from the shores of the Elanitic Gulf to the southern extremity of the Lake Asphaltites or the Dead Sea; and it was manifest, by landmarks of Nature's own providing, that over that sandy plain those seas had once mingled their waters, or perhaps, more probably, that before the cities of the plain had been consumed by brimstone and fire, and Sodom and Gomorrah covered by a pestilential lake, the Jordan had here rolled its waters. The valley varied from four to eight miles in breadth, and on each side were high, dark, and barren mountains, bounding it like a wall. On the left were the mountains of Judea, and on the right those of Seir, the portion given to Esau

as an inheritance; and among them, buried from the eyes of strangers, the approach to it known only to the wandering Bedouins, was the ancient capital of his kingdom, the excavated city of Petra, the cursed and blighted Edom of the Edomites. The land of Idumea lay before me, in barrenness and desolation; no trees grew in the valley, and no verdure on the mountain tops. All was bare, dreary, and desolate."

Pursuing a route through this dreary tract of wilderness, and on approaching Mount Hor, on the summit of which is a small sepulchral edifice, said to be erected over the tomb of Aaron, the traveller turns aside to the right, and, in the bosom of the mountains, reaches the ancient city of Petra, the Edom of the Edomites, now entirely deserted by human beings, but still presenting to the eye a most wonderful spectacle. It is a city whose houses and temples are cut out of the face of the solid rocks. Petra was the capital of the Edomites, and the centering point of commerce betwixt the Red Sea and the higher part of Syria. Ultimately, it fell under the sway of the Romans, by whose architectural genius it was greatly enriched; its final destruction was only a part of the universal ruin which overtook the Syrian cities by the intrusion of barbarian hordes. Of its present aspect, "conceive (says Mr Roberts, a late traveller) a town with the most noble mansions excavated in the face of perpendicular rocks, varying from five hundred to a thousand feet in height, and that to an extent of six or eight miles in all directions; the valleys or narrow ravines forming the streets, with lanes winding over from one to the other to the height I mention. The centre of the main valley had originally been occupied by houses built in the usual way, but repeated earthquakes levelled all in one common mass of ruin. There is now a city fortified by nature, such as never city was before or since, surrounded by mountains, the only passage of entrance through which is by a ravine so narrow that two camels can scarcely enter abreast. While the city was inhabited in ancient times, the hills around were cultivated to the very summit; there was a stream of delicious water flowing through it, and the population must have been immense." One of the most beautiful and perfect of the excavated edifices is that called the *Khasne Faraoun*, or Treasury of Pharaoh; an idea of its appearance, cut out in the face of a rocky precipice, may be obtained from the cut introduced at the commencement of the present sheet.

The secluded valley of Petra is now called by the Arabs Wady Moussa, or Valley of Moses, and, with its ruined city, forms one of the greatest wonders of the known world. On all sides are seen traces of a former period of opulence, refinement, and dense population. In a southern direction from Wady Moussa, is the valley of Sabra, which is a smaller Petra. M. Laborde, a late French traveller, thus speaks of it:—"We had scarcely proceeded an hour's distance down the rapid declivity of Wady Sabra, leading our dromedaries after us, when the supporting walls, ruined buildings, and well-preserved [stone] benches of a theatre, attracted our attention. The ruins of Wady Sabra, as well as those of Wady Pabouchabe, indicate these places to have served as suburbs to the capital—the young swarms sent forth from the parent hive. Had we been enabled to explore the whole of the valleys in the neighbourhood of Wady Moussa, we should, doubtless, have found on all sides similar establishments, which the enormous population of Petra sustained." The prophecies respecting the cities of Mount Seir (Ezekiel, xxxv. 6), are here amply fulfilled. M. Laborde, in his journey along a rocky ridge towards the Red Sea, occasionally met with cultivated spots in this lone wilderness. "The wonderful fertility," he observes, "of these rare patches of earth, in the midst of a sterile country, seemed intended
re mind us that one day that region had been happy,
are a powerful hand had weighed so heavily upon it.
re is to be found at Karek a species of bearded
at, that justifies the text of the Bible against the
es of exaggeration of which it has been the object;
vines also of this country, of the fruit of which
we saw some specimens, account for the en
grapes which the spies sent out by Moses broug
from the places they had visited." As the t
approached the town of Ameimé, about half way
Petra and Akaba, he fell in with another object
"We observed with astonishment, as we purs
way down the mountain, the ancient aqueduc
conveyed the water from the wells of Gana and
to the town of Ameimé, which was built in the
the road from Petra to Aila. This aqueduct,
ing beyond three leagues [nine miles], follows t
of the surface of the country, above which i
rises. It could only have been by attending mo
fully to the undulations of the soil, and by a rem
proficiency in the scientific operations for taking
that the projectors were enabled to succeed in pre
a regular descent for the waters over so great
tance.

The greater part of the remarkable objects o
tecture seen at Petra and in this quarter, are ob
of an origin no earlier than the period of the
sway over the country, which was at the com
ment of the Christian era. These, therefore,
in the main, the chief curiosities of the district
most surprising objects are those remains of ar
may have been produced several thousands o
before Christ, when the adjacent land of Egypt
one side, and Babylonia on the other, were in a
glory. These remains are excavations in the r
a style much more rude than the sculpturings
Roman and Greek artists, some used for dwellin
others simply inscriptions. One of the vales p
ing towards Petra, in a direction from the Red
called Wady Mokatteb, or Valley of the Written
tains, being inscribed with writing in an u
tongue, in the form of carving, on the face of th
pitous rocks. An account of this remarkable c
of art and antiquity, is given by a Franciscan
who visited the spot in the course of a journey t
the land in 1722. "These mountains," he says
called Gebel el Mokatteb, that is to say, the W
Mountains; for as soon as we quitted the mo
of Faran, we passed along others, during a whol
[a length probably of three miles], which were c
with inscriptions in an unknown character, and ca
these hard rocks of marble, to a height which, i
places, was from ten to twelve feet above the
of the ground; and although we had amongst
who understood the Arabian, Greek, Hebrew,
Coptic, Latin, Armenian, Turkish, English, F
German, and Bohemian languages, there was
of us who had the slightest knowledge of the cha
engraved in these hard rocks with great labou
country where there is nothing to be had either
or drink. Hence, it is probable that these cha
contain some profound secrets, which, long bef
birth of Christ, were sculptured in these rocks
Chaldeans or some other persons." The publica
this account, upwards of a century ago, excited
derable interest in Europe; and Pococke and W
Montague went to Arabia for the purpose of b
home copies of the inscriptions, and this they
plished to a certain extent. In 1762, the king o
mark employed Niebuhr to explore Arabia, bu
cially to copy the inscriptions on Wady Mok
subsequently other travellers brought copies to E
and some were published in the Transactions
Royal Society in London; but till this day the i
tions have baffled every attempt to decipher them
figures composing the inscriptions are partly hie
phic, or representations of men and animals with
or what appear to be words interspersed. Ther
be little doubt that they are the oldest writing
world: their antiquity and signification must
entirely to the imagination of the reader.

ANCIENT HISTORY OF GREECE AND ROME.

HISTORY OF GREECE.

SITUATION OF THE COUNTRY.

GREECE is a peninsula situated on the northern shore of the Mediterranean, between the Ionian and Ægean seas. It is a beautiful country of hills and valleys, like Wales or the Highlands of Scotland. Some of the hills are so high as to be constantly covered with snow. The vales or low districts enjoy a mild climate, and are of extreme fertility. Some of them, as Tempe and Arcadia, are spoken of with rapture by the poets of ancient times.

As the country is much divided by hills and indentations of the sea, it was parted, from an early period, into several states, which were under separate governments, and often made war upon each other. The southern part of the peninsula, anciently styled the Peloponnesus, and now the Morea, was divided into Laconia (containing the celebrated city of Sparta), Argolis, Achaia, Arcadia, Elis, and Messenia, each of which was only about the size of a moderate English county. Middle Greece (now Levadia), to the north of the Peloponnesus, and connected with it by the isthmus of Corinth, on which lay the city of that name, contained Attica (in which was the city of Athens), Megaris, Bœotia (in which was the city of Thebes), Phocis, Locris, Doris, Ætolia, and Acarnania. Northern Greece contained Thessaly (now the district of Jannina), Epirus (now Albania), and Macedonia (now Filiba Vilajeti), the last of which did not, however, belong to Greece till a comparatively late period.

To the east of Greece Proper lay the numerous islands of the Ægean Sea, otherwise denominated the Archipelago; with which may be included certain islands lying in the Mediterranean Sea in the same direction, the principal of which was Rhodes, Cyprus, and the Cyclades. To the south lay Cythera (now Cerigo) and Crete (now Candia). To the west, in the Ionian Sea, lay Coreyra (now Corfu), Cephalonia, Ithaca, and others, now constituting the distinct confederacy of the Ionian Islands, under protection of Great Britain.

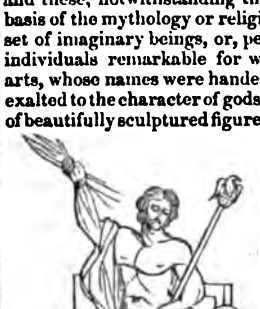
Besides having possession of these various districts on the mainland and islands on both sides of the peninsula, the Greeks, in the course of time, acquired colonies on the coast of Asia Minor, adjacent to the islands in the Ægean Sea. The principal of these foreign possessions, as they may be called, was Ionia, a beautiful and fertile country, the chief city of which was Ephesus.

In consequence of Greece having been divided into a number of petty states, each of which maintained its own political independence, the history of the country necessarily assumes the character of a number of separate narratives. The Greeks, in the different states, did not consider themselves as constituting a single nation or people, although they were in some measure united by similarity of origin, dialect, religion, and manners. It was not, indeed, till a comparatively late period that they had any name for the entire country; the name then assumed was Hellas. The term Grecia (Greece) was conferred by the Romans, and has since been generally used.

EARLY HISTORY AND MYTHOLOGY.

The history of the Grecian states commences above 1800 years before Christ, when the Egyptians on the opposite side of the Mediterranean were in a high state of civilisation; but the portion of history which precedes 884 B. C. is understood to be fabulous, and entitled to little credit. From their situation in a region whose bays, headlands, and islands, present a great extent of sea-coast, habits of adventure and mutual intercourse were produced among the Greeks in the earliest times; these had great influence in cherishing a national activity of character, and making each community eager to rival the prosperity of the others. The people were early accustomed to make voyages, sometimes for traffic, sometimes for war, betwixt the opposite coast of their gulfs, guiding themselves by the stars from island to island; and a curious proof both of their adventurous spirit, and of the difficulties they encountered in their attempts at navigation, is afforded by the tradition which exists in some old poems concerning one of these isles, called Delos, a huge pile of limestone rock, which was frequently used as a sea-mark in the Ægean: this island is said once to have floated about on the waves, and only to have been fixed in its place at last by Jupiter driving a stake through its centre. In the present age, we can understand by this poetical flight that the Greek canoe-men sometimes lost their reckoning, and fell in with the island where they did not expect it.

The accounts given by the poets of this early period of Grecian history, abound in the most ridiculous legends, and these, notwithstanding their absurdity, formed the basis of the mythology or religious belief of the people. A set of imaginary beings, or, perhaps, in some instances, individuals remarkable for warlike genius, or skill in arts, whose names were handed down by tradition, were exalted to the character of gods, and, through the medium of beautifully sculptured figures in marble and ivory, were the objects of reverence and worship. Of these various imaginary beings, Jupiter was reckoned the chief; he was believed to possess the sovereignty of heaven and earth. He is always represented as seated upon a throne, with thunderbolts in his right hand, and an eagle by his side. The wife of Jupiter was Juno, who is described as a beautiful goddess, and is usually depicted as seated in a chariot drawn by two peacocks.



Jupiter.

Next in dignity to Jupiter was Neptune, the god of the ocean, who is painted as a half-naked man, of majestic figure, with a crown on his head, and a trident, or three-pronged fork, in his hand. A third principal deity was Pluto, the god of the infernal regions; he was represented by the Greeks as seated on a throne, with his wife Proserpine by his side, and the three-headed dog Cerberus before him. Apollo was the god of music, poetry, and painting; Bacchus the god of wine; Mars the god of war; Mercury was the messenger of Jupiter, and the god of merchandise and thieving; Cupid the god of love; Minerva the goddess of wisdom; Diana the goddess of hunting; Ceres, the goddess of grain, or of agriculture; Hebe, the goddess of youth; Vulcan, the fabricator of Jupiter's thunderbolts, and the husband of Venus, the goddess of beauty. There were many other gods and goddesses, held more or less in reverence by the Greeks, and to whom worship was given at altars in the temples. There was also a belief in three vengeful females termed Furies, who were impersonations of Grief, Terror, and Madness; also three females of exceedingly elegant figure, termed the Graces, and whose names were Aglaia, Thalia, and Euphrosyne. The nine Muses, or patronesses of the fine arts, were Thalia, Melpomene, Calliope, Clio, Erato, Euterpe, Polyhymnia, Terpsichore, and Urania. They were supposed to reside upon Parnassus, a lofty mountain in the district of Phocis. Thalia presided over comedy; Melpomene over tragedy; Erato over amatory poetry; Polyhymnia over lyrical poetry; Calliope over heroic or epic poetry and eloquence; Clio over history; Euterpe over music; Terpsichore over dancing; and Urania over the study of astronomy. Besides all these imaginary beings, the mythology comprehended a class of demi-gods, as Dryads, or wood-nymphs; Satyrs, or rural deities; and Naiads, or water-nymphs.

Pluto.

The gods were supposed to communicate with men, and to reveal the secrets of futurity by means of oracles, several of which existed in various parts of Greece. The most celebrated of the Grecian oracles was that of Apollo at Delphi, a city built on the slope of Mount Parnassus. At a very remote period it had been discovered that from a deep cavern in the side of that mountain an intoxicating vapour issued, the effect of which was so powerful as to throw into convulsions both men and cattle who inhaled it. Of this natural wonder, the priesthood readily availed themselves. A temple was reared over the spot, and a priestess, named the Pythoness, was appointed, whose office it was to inhale, at stated intervals, the holy vapour. performing this dangerous office, the Pythoness wn into convulsions, during which she uttered ..ries, and these being arranged by the attenists into sentences, were delivered to the people as the prophecies of the oracle, or god. L oracle should be brought into discredit, care general taken by the priest to couch the resp any question put to the Pythoness, in langu obscure and enigmatical, that whatever course the should take, the prediction might not be falsified Greeks were so superstitious as to put implicit this pretended system of prophecy, and the fame oracle of Delphi became so great that no ent was undertaken in any part of Greece without sultation of the Pythoness.

—There is probably some shadow of truth in a the alleged events of early Grecian history. T who lived in the thirteenth century before Chri said to have laid the foundation of the greatness state of Attica, by uniting its twelve cities, and them a common constitution. About his time oc the celebrated *Argonautic Expedition*. This was taken by Jason, a prince of Thessaly, in a vessel *Argo* (hence the name of the expedition); he s Colchis, a place on the east coast of the Euxine o Sea, probably with the design of obtaining g silver, for which that country was remarkable. his companions was a chief named Hercules, a of uncommon strength, and who afterwards w deified by the Greeks. The poets say that P and Helle, the son and daughter of Athamas, Thebes, being compelled to quit their native cou avoid the cruelty of their stepmother, mounted back of a winged ram with a fleece of gold, an carried by this wonderful animal through the air t Colchis, where an uncle of theirs, named Æt king. Unfortunately, as they were passing o strait now called the Dardanelles, which conne Ægean sea with the Propontis, or sea of Ma Helle became giddy, and, falling into the wat drowned. From her, says the fable, the strait future named the Hellespont, or sea of Helle. Phryxus arrived in Colchis, he sacrificed his ram to Jupiter, in acknowledgment of divine pro and deposited its golden fleece in the same deity's He then married the daughter of Æetes, but wa wards murdered by that king, who wished to possession of the golden fleece. To avenge Ph death, Jason, who was his relation, undertook th dition to Colchis, where, after performing severa vellous exploits, he not only obtained the golden but persuaded Medea, another daughter of king to become his wife, and to accompany him Greece.

Seventy years after the Argonautic exp namely, about the year 1194 before Christ, th brated Trojan war was commenced. We lea events connected with this war only through t heroic poems of the Iliad and Odyssey, which a posed to have been composed about the year 90 Christ, by Homer, a blind man who wandered ab country singing his poems for a livelihood. Th is shortly as follows:—Tyndarus, a king of Lace had a daughter Helen, of great beauty, whom T king of Athens, attempted, but without success, from her father. The intelligence of this event re Helen famous, and many of the princes of Greec her in marriage. Tyndarus, however, allow daughter to make choice of a husband, and she upon Menelaus; the successful suitor, on the d Tyndarus, was raised to the Spartan throne. after this apparently happy union, Paris, a son of king of Troy, a small state in Asia Minor, came t at the court of Menelaus, and there perfidiously Helen to elope with him. Wroth at this baseness, laus summoned various forces to his aid, and on a warlike expedition to Troy. Of the chiefs bled on this occasion, the most celebrated were memnon, king of Mycenæ; Menelaus, king of Ulysses, king of Ithaca; Nestor, king of Pylos; A son of the king of Thessaly; Ajax, of Salamis medes, of Ætolia; and Idomeneus, of Crete combined forces, on landing in the Trojan ter

commenced a regular siege of the city of Troy. Many skirmishes took place, and there was great slaughter on both sides; the Trojans were led generally in their attacks by the valiant Hector, eldest son of Priam. At length, after a siege of ten years, Troy was taken, its inhabitants slaughtered, and its edifices burnt to the ground. The Greek princes, however, paid dearly for their triumph by subsequent sufferings, and the disorganisation of their kingdoms at home. Ulysses, if we may believe Homer, spent ten years in wandering over seas and lands before arriving in his island of Ithaca; and others of the leaders died, or were shipwrecked, on their way home.

In the course of the eleventh century before Christ, the Greeks began to plant colonies in neighbouring countries. The first colonists, as usually happens in the present day, were dissatisfied citizens, who thought they could form happier communities elsewhere. The Æolians founded twelve cities in Asia Minor, the chief of which was Smyrna. The Dorians sent off colonies to Italy and Sicily, founding, in the former, Tarentum and Locri, and in the latter Agrigentum and Syracuse. In the new settlements the political system was eminently democratic; and for a long time they enjoyed great prosperity. This prosperity being ascribed at home to their popular institutions, had afterwards the effect of inciting many of the parent states to change their monarchical for a democratic form of government.

SECOND OR AUTHENTIC PERIOD OF HISTORY.

The second and authentic period of Greek history commences in the year 884 B. C., at the institution of the Olympic festival, when the people had begun to emerge from their primitive barbarism. The Olympic festival was instituted by direction of the Delphic oracle, by Iphitus, prince of Eleia or Elis, for the patriotic purpose of assembling together, in a peaceful manner, persons from all parts of Greece. The festival was ordained to take place once every four years, in the month corresponding to our July, and to last five days, during which there was to be complete truce, or cessation from war, throughout the Grecian states. Agreeably to the ancient practice at public solemnities, the festival was celebrated by games and various feats of personal skill, and the whole order of procedure was regulated with extraordinary care. All freemen of Grecian extraction were invited to contend, provided they had been born in lawful wedlock, and had lived untainted by any infamous moral stain. No women (the priestesses of Ceres excepted) were permitted to be present. Females who violated this law were thrown from a rock. The competitors prepared themselves during ten months previous at the gymnasium at Elis. During the last thirty days, the exercises were performed with as much regularity as at the games themselves. The festival began in the evening with solemn sacrifices, and the games were commenced the next day at daybreak. These consisted in races on horseback and on foot, in leaping, throwing the discus or quoit, wrestling, and boxing; musical and poetical contests concluded the whole. The honour of having gained a victory in the Olympic games was very great; it extended from the victor to his country, which was proud of owning him. However rude and boisterous were some of the sports of the Olympic festival, it is acknowledged by the best authorities that they were attended with manifold advantages to society. It is sufficient barely to mention the suspension of hostilities, which took place not only during the festival, but a considerable time both before and after it. Considered as a kind of religious ceremony, at which the whole Grecian citizens were invited, and even enjoined, to assist, it was well adapted to facilitate intercourse, to promote knowledge, to soften prejudice, and to hasten the progress of civilisation and humanity. The date of the establishment of the Olympic games (884 B. C.) was afterwards assumed by the Greeks as the epoch from which they reckoned the progress of time, the four years intervening between each recurrence of the festival being styled an Olympiad.

At the first institution of the Olympic festival, and for one or two centuries afterwards, the condition of Grecian society was primitive and almost patriarchal, but marked by strong features of heroic dignity, and a certain depth and refinement of thought. The attire of the men was very simple, consisting only of a shirt or close jacket to the body, with a loose robe hanging down over the naked limbs, while performers in the public games were almost naked. The arts, including agriculture, were also little advanced; few persons seemed to have thought of toiling to accumulate wealth; and each community presented, in time of peace, the picture of a large family. That portion of the people constituting the freemen lived much in public, or in the society of their equals, enjoyed common pleasures and amusements, and had daily opportunities of displaying their useful talents in the sight of their fellow-citizens. The frequent disputes between individuals occasioned litigations and trials, which furnished employment for the eloquence and ability of men, in the necessary defence of their friends. The numerous games and public solemnities opened a continual source of entertainment, and habituated every man to active physical exercise and the performance of his duties as a soldier. These were agreeable features in the condition of Grecian society; but there were also some of a contrary kind. The people were of an unsettled disposition, never satisfied long with any kind of government which existed amongst them, and very much disposed to war against neighbouring states on the most trifling pretences.

The population of the various states was divided into three classes, namely, the citizens, the enfranchised populace, and the slaves. All political power, even in the most democratical of the Grecian communities, was possessed by the first of these classes, while in the oligarchical states only that small portion of the citizens which constituted the nobility or aristocracy, possessed any influence in the management of public affairs. The mechanical and agricultural labours necessary for the support and comfort of the whole, were chiefly performed by the inferior class of free inhabitants, who did not enjoy the privilege of citizenship, and by the slaves, who formed a considerable portion of the population of every state. These slaves were sprung from the same general or parent stock, spoke the same language, and professed the same religion, as their masters. They were, in most cases, the descendants of persons who had been conquered in war, but were in some instances acquired by purchase. Society being thus based on vicious principles, it is not wonderful that the Grecian states were the scene of constant civil broils.

Sparta—Lycurgus.

At the beginning of this period of Grecian history, our attention is powerfully attracted by a very remarkable series of proceedings which took place in Lacedæmon, or Laconia, a country of Southern Greece, of which the chief city was Sparta. This city being in a state of intestine disorder, it was agreed by many of the inhabitants to invite Lycurgus, the son of one of their late kings, to undertake the important task of preparing a new constitution for his country. Fortified with the sanction of the Delphic oracle, he commenced this difficult duty, not only settling the form of government but reforming the social institutions and manners of the people. The government he established consisted of two joint kings, with a limited prerogative, and who acted as presidents of a senate of twenty-eight aged men. The functions of the senate were deliberative as well as executive, but no law could be passed without receiving the consent of the assembled citizens. The most remarkable of the arrangements of Lycurgus, was his attempt to abolish difference of rank, and even difference of circumstances, among the people. He resolved on the bold measure of an equal division of lands, and actually parcelled out the Laconian territory into thirty-nine thousand lots, one of which was given to each citizen of Sparta, or free

inhabitant of Laconia. Each of these lots was of such a size as barely sufficed to supply the wants of a single family, for Lycurgus was determined that no person should be placed in such circumstances as would permit of luxurious living.

Lycurgus carried into effect a number of other visionary projects; he abolished the use of money, with the hope of preventing undue accumulation of wealth; prohibited foreigners from entering the country, and the natives from going abroad, in order to preserve simplicity of manners among the people; directed that all men, without distinction of rank or age, should eat daily together at public tables, which were furnished with the plainest food; and finally ordained that all the children who were born, and seemed likely to be strong, should be reared by public nurses, under a rigid system of privation and personal activity, while the weak infants should be thrown out to the fields to perish. The citizens, when they had attained the age of manhood, were engaged in martial exercises, all labour being left to the slaves, or *helots*, as they were termed; and, in short, the whole nation was but a camp of soldiers, and war was reckoned the only legitimate profession. These laws were in some measure suited to the rude condition of the Spartans, but, as being opposed to some of the best and strongest principles in human nature, they could not possibly endure, and there is reason to believe that some of them were not strictly enforced. It is not unusual to see historians use the term *Spartan virtue* with a certain degree of admiration of its quality, but the Spartans had in reality no moral dignity, certainly no benevolence, in their virtue, either public or private. They were a small confederacy of well-trained soldiers, and, merely as such, deserve no mark of our respect or esteem. The manner in which they used their helots was at once barbarous and cruel. The murder of a serf by a free citizen was not punishable by law; nay, it was even allowable for the young Spartans to lie in wait, as a kind of sport, for any good-looking or saucy-looking slave, and stab him to the heart on the highway. It is certain, that at one time, when the helots had stood their masters in good stead in battle, they were desired, by way of reward, to choose out 2000 of their best men, that they might receive their freedom, and be enrolled as Spartans, and that these 2000 men were all silently murdered soon after. At another time, when danger was apprehended from the growing numbers and petty wealth of the boors, the senate enacted the farce of declaring war against them, and coolly murdered many thousands, in order to thin their numbers and break their spirit. Had there been any redeeming trait in the Spartan character to compensate for such barbarity, one would have wondered less at the respect which is sometimes paid them; but their military fame only adds another instance to the many already on record, that the most ignorant and savage tribes make the most dogged soldiers.

Athens.

We now turn to Athens, the capital of Attica, and long the principal seat of Grecian learning and refinement. Athens is said to have been founded by Cecrops, 1550 B. C., and in the most ancient times was called Cecropia, which name, in after times, was retained merely in the Acropolis, a citadel situated on a rocky mount overhanging the town. It probably received the name of Athens from the goddess Minerva, who was called also Athena by the Greeks, and to whom an elegant temple had been erected in the city. The old city spread from the mount of the Acropolis over a wide and pleasant vale or low peninsula, formed by the junction of the Cephesus and Ilissus. Its distance from the sea-coast was about five miles. In the course of time, Athens became populous and surpassingly elegant in its architecture, while its citizens contrived to take a lead in the affairs of the communities around. At first they were governed by kings, but, as in the case of the Spartan citizens, they became dissatisfied with their existing constitution, and about the year 600 B. C. invited Solon, one of the wisest men in Greece, to reorg their political constitution. Solon obeyed the summ and constituted the government on a broad republ basis. a council of state, forming a judicial c of and called the Areop of besides its other duties, exercised a censorship over public morals, and was powered to punish impiety, profligacy, and even idl To this court every citizen was bound to make an a statement of his income, and the sources from which derived. The court was long regarded with very respect, and the right was accorded to it of not on vising the sentences pronounced by the other cri tribunals, but even of annulling the judicial decr the general assembly of the people. The regulatio Solon were not maintained for any great length of although the republican form of government, in shape or other, continued as long as the country r tained its independence. Clesthenes, the leader party, enlarged the democratic principle in the s he introduced the practice of *ostracism*, by whic person might be banished for ten years without accused of any crime, if the Athenians apprehe that he had acquired too much influence, or harbo designs against the public liberty. This sentenc called ostracism, because the citizens, in voting f infliction, wrote the name of the obnoxious indiv upon a shell. It is said that Clesthenes was the victim of his own law, as has chanced in several remarkable cases.

For a period of about two centuries after the e ment of a republican constitution, there is little o portance to relate in Athenian history. Athens gradually enlarged, the taste for refinement increa and various men of sagacious understanding, cal philosophers, began to devote themselves to inqu into the nature of the human mind and the char of the Deity. The principal Grecian philosopher flourished in this era (550 B. C.) was Pythagoras, a of pure and exalted ideas, and an able expounde the science of mind.

THIRD PERIOD OF HISTORY.

Persian Invasion.

The year 490 B. C. closes the gradually imper period in Grecian history—or second period, as it been termed—and now commenced an era marke the important event of an invasion from a pow Asiatic sovereign. Darius, king of Persia, h imagined the possibility of conquering Greece, se immense army against it in the year just mentio Greatly alarmed at the approach of such an enemy Athenians applied to the Spartans for aid, but people had a superstition which prohibited their t the field before the moon was at the full; and a the time of the application, it still wanted five da that period, they therefore delayed the march of troops. Being thus refused all assistance from neighbours, the Athenians were left to depend on on their own courage and resources. A more rem able instance of a small state endeavouring to oppos wicked aggression of an overgrown power, has n occurred in ancient or modern times; but the con exercises and training of the Athenian popul enabled them to present a bold, and by no means temptible, front to the invader. War had been principal employment, and in the field they displ their noblest qualities. They were unacquainted those highly disciplined evolutions which give har and concert to numerous bodies of men; but when wanting in skill they supplied by courage. The A nian, and also other Greek soldiers, marched to field in a deep phalanx, rushed impetuously to attack, and bravely closed with their enemies. warrior was firmly opposed to his antagonist, and pelled by necessity to the same exertions of valo if the fortune of the day had depended on his s arm. The principal weapon was a spear, which, th by the nervous and well-directed vigour of a st

hand, often penetrated the firmest shields and bucklers. When they missed their aim, or when the stroke proved ineffectual through want of force, they drew their swords, and summoning their utmost resolution, darted impetuously on the foe. This mode of war was common to the soldiers and generals, the latter being as much distinguished in battle by their strength and courage as their skill and conduct. The Greeks had bows, slings, and darts, intended for the practice of distant hostility; but their chief dependence was on the spear and sword. Their defensive armour consisted of a bright helmet, adorned with plumes, and covering the head, a strong

casket defending the breast, greaves of brass descending the leg to the feet, and an ample shield, loosely attached to the left shoulder and arm, which turned in all directions, and opposed its firm resistance to every hostile assault. With men thus organised and accoutred, a battle consisted of so many duels, and the combatants fought with all the keenness of personal resentment; the slaughter in such engagements was correspondingly great, the fight seldom terminating till one party was nearly destroyed, or at least greatly reduced in numbers.

It was a people so animated and prepared that the hosts of Persia were about to encounter. Compelled to meet the invaders unassisted, the Athenians were able to march an army of only 9000 men, exclusive of about as many light-armed slaves, into the field. With Miltiades as their leader and commander-in-chief, they met the Persians in battle on the plain of Marathon, thirty miles from Athens, and by great skill and courage, and the force of their close phalanx of spearmen, completely conquered them. Upwards of 6000 Persians were slain on the field, while the number killed of the Athenians was but 192. This is reckoned by historians one of the most important victories in ancient times, for it saved the independence of the whole of Greece. To the disgrace of the fickle Athenians, they afterwards showed the greatest ingratitude to Miltiades, and put him in prison on a charge of favouring the Persians. He died there, the year after his great victory. Soon after, the citizens of Athens, on a plea equally unfounded, banished Aristides, an able leader of the aristocratic party in the state, and who, from his strict integrity and wisdom, was usually entitled "Aristides the Just." On the banishment of this eminent individual, Themistocles, a person who was more democratic in his sentiments, became the leader of the councils of the Athenians. Meanwhile, the Grecian liberties were again menaced by the Persians. Xerxes, son of Darius, marched an army across the Hellespont by a bridge of boats from the Asiatic shore, and led it towards the southern part of Greece. The utmost force that the confederated Greeks could oppose to the countless host of Persians, did not exceed 60,000 men. Of these, a band of Spartans, numbering 8000 soldiers, under Leonidas their king, was posted at the pass of Thermopylæ, to intercept the enemy, and here they discomfited every successive column of the Persians as it entered the defile. Ultimately, foreseeing certain destruction, Leonidas commanded all to retire but three hundred, with whom he proposed to give the Persians some idea of what the Greeks could submit to for the sake of their country. He and his three hundred were cut off to a man. Xerxes took possession of Attica and Athens, but in the naval battle with the Athenian fleet at Salamis which occurred soon after (October 20, 480 B. C.), his army was utterly routed, and its scattered remains retreated into Asia.

By this splendid victory, the naval power of Persia was almost annihilated, and the spirit of its monarch so completely humbled, that he durst no longer undertake offensive operations against Greece. Here, therefore, the war ought to have terminated; but so great and valuable had been the spoils obtained by the confederates, that they were unwilling to relinquish the profitable contest. The war, therefore, was continued for twenty years longer, less, apparently, for the chastisement of Persia than for the plunder of her conquered provinces.

But now that all danger was over, many of the smaller states, whose population was scanty, began to grow weary of the contest, and to furnish with reluctance their annual contingent of men to reinforce the allied fleet. It was, in consequence, arranged that those states whose citizens were unwilling to perform personal service, should send merely their proportion of vessels, and pay into the common treasury an annual subsidy, for the maintenance of the sailors with whom the Athenians undertook to man the fleet. The unforeseen but natural consequence of this was the establishment of the complete supremacy of Athens. The annual subsidies gradually assumed the character of a regular tribute, and were compulsorily levied as such; while the recusant communities, deprived of their fleets, which had been given up to the Athenians, were unable to offer effectual resistance to the oppressive exactions of the dominant state. The Athenians were thus raised to an unprecedented pitch of power and opulence, and enabled to adorn their city, to live in dignified idleness, and to enjoy a constant succession of the most costly public amusements, at the expense of the vanquished Persians, and of the scarcely more leniently treated communities of the dependent confederacy.

Pericles.

We have arrived at the most flourishing period of Athenian history, during which Pericles rose to distinction, and greatly contributed to the beautifying of the capital. The talents of Pericles were of the very first order, and they had been carefully cultivated by the ablest tutorage which Greece could afford. After serving for several years in the Athenian army, he ventured to take a part in the business of the popular assembly, and his powerful eloquence soon gained him an ascendancy in the national councils; and his power, in fact, became as great as that of an absolute monarch. (445 B. C.) Some of the most interesting events of Grecian history now occurred. After a number of years of general peace, a dispute between the state of Corinth and its dependency the island of Corcyra (now Corfu), gave rise to a war which again disturbed the repose of all the Grecian states. Corcyra was a colony of Corinth, but having, by its maritime skill and enterprise, raised itself to a higher pitch of opulence than its parent city, it not only refused to acknowledge Corinthian supremacy, but went to war with that state on a question respecting the government of Epidamnus, a colony which the Corcyreans had planted on the coast of Illyria. Corinth applied for and obtained aid from several of the Peloponnesian states to reduce the Corcyreans to subjection; while Corcyra, on the other hand, concluded a defensive alliance with Athens, which sent a fleet to assist the island in vindicating its independence. By way of punishing the Athenians for intermeddling in the quarrel, the Corinthians stirred up a revolt in Potidæa, a town of Chalcidice, near the confines of Macedonia, which had originally been a colony of Corinth, but was at this time a tributary of Athens. The Athenians immediately dispatched a fleet and army for the reduction of Potidæa, and the Peloponnesians were equally prompt in sending succours to the city. The Corinthians, meanwhile, were actively engaged in endeavouring to enlist in their cause those states which had not yet taken a decided part in the

dispute. To Lacedæmon, in particular, they sent ambassadors to complain of the conduct of the Athenians, which they characterised as a violation of an universally recognised law of Grecian policy, that no state should interfere between another and its dependencies. The efforts of the Corinthians were successful, and almost all the Peloponnesian states, headed by Sparta, together with many of those beyond the isthmus, formed themselves into a confederacy for the purpose of going to war with Athens. Argos and Achaia at first remained neuter. Corcyra, Acarnania, some of the cities of Thessaly, and those of Platæa and Naupactus, were all that took part with the Athenians.

Pericles beheld without dismay the gathering of the storm, but his countrymen were not equally undaunted. They perceived that they were about to be called upon to exchange the idle and luxurious life they were at present leading for one of hardship and danger, and they began to murmur against their political leader for involving them in so alarming a quarrel. They had not at first the courage to impeach Pericles himself, but vented their displeasure against his friends and favourites. Phidias, a very eminent sculptor, whom the great statesman had appointed superintendant of public buildings, was condemned to imprisonment on a frivolous charge; and the philosopher Anaxagoras, the preceptor and friend of Pericles, was charged with disseminating opinions subversive of the national religion, and banished from Athens. Respecting another celebrated individual who at this time fell under persecution, it becomes necessary to say a few words. Aspasia of Miletus was a woman of remarkable beauty and brilliant talents, but she wanted that chastity which is the greatest of feminine graces, and by her dissolute life was rendered a reproach, as she would otherwise have been an ornament, to her sex. This remarkable woman, having come to reside in Athens, attracted the notice of Pericles, who was so much fascinated by her beauty, wit, and eloquence, that, after separating from his wife, with whom he had lived unhappily, he married Aspasia. It was generally believed, that, for the gratification of a private grudge, she had instigated Pericles to quarrel with the Peloponnesian states, and her unpopularity on this score was the true cause of her being now accused, before the assembly of the people, of impiety and grossly immoral practices. Pericles conducted her defence in person, and pled for her with so much earnestness that he was moved even to tears. The people, either finding the accusations to be really unfounded, or unable to resist the eloquence of Pericles, acquitted Aspasia. His enemies next directed their attack against himself. They accused him of embezzling the public money; but he completely rebutted the charge, and proved that he had drawn his income from no other source than his private estate. His frugal and unostentatious style of living must have, of itself, gone far to convince the Athenians of the honesty with which he had administered the public affairs; for while he was filling the city with temples, porticoes, and other magnificent works of art, and providing many costly entertainments for the people, his own domestic establishment was regulated with such strict attention to economy, that the members of his family complained of a parsimony which formed a marked contrast to the splendour in which many of the wealthy Athenians then lived.

Confirmed in his authority by this triumphant refutation of the slanders of his enemies, Pericles adopted the wisest measures for the public defence against the invasion which was threatened by the Peloponnesians. Unwilling to risk a battle with the Spartans, who were esteemed not less invincible by land than the Athenians were by sea, he caused the inhabitants of Attica to transport their cattle to Eubœa and the neighbouring islands, and to retire, with as much of their other property as they could take with them, within the walls of Athens. By his provident care the city was stored with provisions sufficient for the support of the multitudes which now crowded it; but greater difficulty was found in furnishing proper accommodation for such a population. Many found lodgings in the towers and other public edifices, or in the turrets on the walls, and great numbers were obliged to construct themselves temporary abodes in the vacant spaces between the long walls extending between the city and the port of Piræus.

The memorable contest of twenty-seven years' duration, called "the Peloponnesian war," now commenced (431 B. C.) The Spartan king, Archidamus, entered Attica at the head of a large army of the confederates, and, meeting with no opposition, proceeded along the eastern coast, burning the towns and laying waste the country in his course. When the Athenians saw the enemy ravaging the country almost up to their walls, it required all the authority of Pericles to keep them within their fortifications. While the confederates were wasting Attica with fire and sword, the Athenian and Corcyræan fleets were, by the direction of Pericles, avenging the injury, by ravaging the almost defenceless coasts of the Peloponnesus. This, together with the scarcity of provisions, soon induced Archidamus to lead his army homewards. He retired by the western side of Attica, continuing the work of devastation as he passed along.

Early in the summer of the following year, the confederates returned to Attica, which they were again permitted to ravage at their pleasure, as Pericles still adhered to his cautious policy of confining his efforts to the defence of the capital. But an enemy far more terrible than the Peloponnesians attacked the unfortunate Athenians. A pestilence, supposed to have originated in Ethiopia, and which had gradually spread over Egypt and the western parts of Asia, broke out in the town of Piræus, the inhabitants of which at first supposed their wells to have been poisoned. The disease rapidly advanced into Athens, where it carried off a great number of persons. It is described as having been a species of infectious fever, accompanied by many painful symptoms, and followed, in those who survived the first stages of the disease, by ulcerations in the bowels and limbs. Historians mention, as a proof of the singular virulence of this pestilence, that the birds of prey refused to touch the unburied bodies of the victims, and that all the dogs which fed upon the pernicious relics perished. The mortality was dreadful, and was, of course, greatly increased by the overcrowded state of the city. The prayers of the devout, and the skill of the physicians, were found equally unavailing to stop the progress of the disease, and the miserable Athenians, reduced to despair, believed themselves to be forgotten or hated by their gods. The sick were in many cases left unattended, and the bodies of the dead allowed to lie unburied, while those whom the plague had not yet reached, openly set at defiance all laws human and divine, and rushed into every excess of criminal indulgence.

Pericles was in the mean time engaged, with a fleet of 150 ships, in wasting with fire and sword the shores of the Peloponnesus. At his return to Athens, finding that the enemy had hastily retired from Attica, through fear of the contagion of the plague, he dispatched a fleet to the coast of Chalcidice, to assist the Athenian land forces who were still engaged in the siege of Potidæa—an unfortunate measure, productive of no other result than the communication of the pestilence to the besieging army, by which the majority of the troops were speedily swept away. Maddened by their sufferings, the Athenians now became loud in their murmurings against Pericles, whom they accused of having brought upon them at least a portion of their calamities, by involving them in the Peloponnesian war. An assembly of the people was held, in which Pericles entered upon a justification of his conduct, and exhorted them to courage and perseverance in defence of their independence. The hardships to which they had been exposed by the plague were, he observed, only such as he had in former addresses prepared them to expect; and as for the pestilence, it was a calamity which no human prudence

either have foreseen or averted. He reminded them that they still possessed a fleet which that of no potentate on earth could equal or cope with, and that, after the present evil should have passed away, their navy might yet enable them to acquire universal empire. "What we suffer from the gods," continued he, "we should bear with patience; what from our enemies, with manly firmness; and such were the maxims of our forefathers. From unshaken fortitude in misfortune has arisen the present power of this commonwealth, together with that glory, which, if our empire, according to the lot of all earthly things, decay, shall still survive to all posterity."

The eloquent harangue of Pericles diminished, but did not remove, the alarm and irritation of the Athenians, and they not only dismissed him from all his offices, but imposed upon him a heavy fine. Meanwhile, domestic afflictions were combining with political anxieties and mortifications to oppress the mind of this eminent man, for the members of his family were one by one perishing by the plague. Still, however, he bore himself up, with a fortitude which was witnessed with admiration by all around him; but at the funeral of the last of his children, his firmness at length gave way; and while he was, according to the custom of the country, placing a garland of flowers on the head of the corpse, he burst into loud lamentations, and shed a torrent of tears. It was not long till his mutable countrymen repented of their harshness towards him, and reinvested him with his civil and military authority. He soon after followed his children to the grave, falling, like them, a victim to the prevailing pestilence (429 B. C.) The concurrent testimony of the ancient writers assigns to Pericles the first place among Grecian statesmen for wisdom and eloquence. Though ambitious of power, he was temperate in its exercise; and it is creditable to his memory, that, in an age and country so little scrupulous in the shedding of blood, his long administration was as merciful and mild as it was vigorous and effective. When constrained to make war, the constant study of this eminent statesman was how to overcome his enemies with the least possible destruction of life, as well on their side as on his own. It is related, that when he was lying at the point of death, and while those who surrounded him were recounting his great actions, he suddenly interrupted them by expressing his surprise that they should bestow so much praise on achievements in which he had been rivalled by many others, while they omitted to mention what was his highest and peculiar honour, namely, *that no act of his had ever caused any Athenian to put on mourning.*

After the death of Pericles, the war was continued without interruption for seven years longer, but with no very decisive advantage to either side. During this period the Athenian councils were chiefly directed by a coarse-minded and unprincipled demagogue, named Cleon, who was at last killed in battle under the walls of Amphipolis, a Macedonian city, of which the possession was disputed by the Athenians and Lacedæmonians. Cleon was succeeded in the direction of public affairs by Nicias, the leader of the aristocratical party, a man of virtuous but unenterprising character, and a military officer of moderate abilities. Under his auspices a peace for fifty years, commonly known by the name of the "peace of Nicias," was concluded in the tenth year of the war (421 B. C.) It was not long, however, till the contest was resumed. Offended that its allies had given up a contest undertaken for the assertion of its alleged rights, Corinth refused to be a party to the treaty of peace, and entered into a new quadruple alliance with Argos, Elis, and Mantinæa, a city of Arcadia; the ostensible object of which confederation was the defence of the Peloponnesian states against the aggressions of Athens and Sparta. This end seemed not difficult of attainment, as fresh distrusts had arisen between the two last-mentioned republics, on account of the reluctance felt and manifested by both to give up certain places which they had bound themselves by treaty mutually to surrender. The jealousies thus excited, were fanned into a violent flame by the artful measures of Alcibiades, a young Athenian, who now began to rise into political power, and whose genius and character subsequently exercised a strong influence upon the affairs of Athens.

Alcibiades.

Alcibiades was the son of Clinias, an Athenian of high rank. Endowed with uncommon beauty of person, and talents of the very highest order, he was, unfortunately, deficient in that unbending integrity, which is an essential element of every character truly great, and his violent passions sometimes impelled him to act in a manner which has brought disgrace on his memory. While still very young, Alcibiades served in the Athenian army, and became the companion and pupil of Socrates, one of the wisest and most virtuous of the Grecian sages. Having rendered some service to his country in a protracted and useless war with Lacedæmon, and being possessed of a talent for addressing the passions of the multitude, Alcibiades, as others had done before him, became the undisputed head of public affairs in Athens. But this pre-eminence was not of long continuance. An opinion arose among the people that he designed to subvert the constitution, and his fall was as quick as his promotion. Many of his friends were put to death, and he, while absent on an expedition, deprived of his authority. Being thus left without a public director of affairs, Athens, as usual, was torn by internal discords; the aristocratic faction succeeded in overthrowing the democratical government (411 B. C.), and establishing a council of 400 individuals to administer the affairs of the state, with the power of convoking an assembly of 5000 of the principal citizens for advice and assistance in any emergency. These 400 tyrants, as they were popularly called, were no sooner invested with authority, than they annihilated every remaining portion of the free institutions of Athens. They behaved with the greatest insolence and severity towards the people, and endeavoured to confirm and perpetuate their usurped power, by raising a body of mercenary troops in the islands of the Ægean, for the purpose of overawing and enslaving their fellow-citizens. The Athenian army was at this period in the island of Samos, whither it had retired after an expedition against the revolted cities of Asia Minor. When intelligence arrived of the revolution in Athens, and the tyrannical proceedings of the oligarchical faction, the soldiers indignantly refused to obey the new government, and sent an invitation to Alcibiades to return among them, and assist in re-establishing the democratical constitution. He obeyed the call; and as soon as he arrived in Samos, the troops elected him their general. He then sent a message to Athens, commanding the 400 tyrants to divest themselves immediately of their unconstitutional authority, if they wished to avoid deposition and death at his hands.

This message reached Athens at a time of the greatest confusion and alarm. The 400 tyrants had quarrelled among themselves, and were about to appeal to the sword; the island of Eubœa, from which Athens had for some time been principally supplied with provisions, had revolted, and the fleet which had been sent to reduce it had been destroyed by the Lacedæmonians, so that the coasts of Attica, and the port of Athens itself, were now without defence. In these distressing circumstances, the people, roused to desperation, rose upon their oppressors, overturned the government of the 400, after an existence of only a few months, and re-established their ancient institutions. Alcibiades was now recalled; but before revisiting Athens, he was desirous of performing some brilliant military exploit, which might obliterate the recollection of his late connection with the Spartans, and give his return an air of triumph. He accordingly joined the Athenian fleet, then stationed at the entrance of the Hellespont, and soon obtained several important victories over the Lacedæmonians, both by sea and land. He then returned to Athens, where he was received with transports of joy. Chaplets of flowers were showered upon

his head, and amidst the most enthusiastic acclamations he proceeded to the place of assembly, where he addressed the people in a speech of such eloquence and power, that, at its conclusion, a crown of gold was placed upon his brows, and he was invested with the supreme command of the Athenian forces, both naval and military. His forfeited property was restored, and the priests were directed to revoke the curses which had formerly been pronounced upon him.

This popularity of Alcibiades was not of long continuance. Many of the dependencies of Athens being in a state of insurrection, he assumed the command of an armament intended for their reduction. But circumstances arose which obliged him to leave the fleet for a short time in charge of one of his officers, named Antiochus, who, in despite of express orders to the contrary, gave battle to the Lacedæmonians during the absence of the commander-in-chief, and was defeated. When intelligence of this action reached Athens, a violent clamour was raised against Alcibiades; he was accused of having neglected his duty, and received a second dismissal from all his offices. On hearing of this, he quitted the fleet, and, retiring to a fortress he had built in the Chersonesus of Thrace, he collected around him a band of military adventurers, with whose assistance he carried on a predatory warfare against the neighbouring Thracian tribes.

Alcibiades did not long survive his second disgrace with his countrymen. Finding his Thracian residence insecure, on account of the increasing power of his Lacedæmonian enemies, he crossed the Hellespont and settled in Bithynia, a country on the Asiatic side of the Propontis. Being there attacked and plundered by the Thracians, he proceeded into Phrygia, and placed himself under the protection of Pharnabasus, the Persian satrap of that province. But even thither the unfortunate chief was followed by the unrelenting hatred of the Lacedæmonians, by whose directions he was privately and foully assassinated. Thus perished, about the fortieth year of his age (403 B. C.), one of the ablest men that Greece ever produced. Distinguished alike as a warrior, an orator, and a statesman, and in his nature noble and generous, Alcibiades would have been truly worthy of our admiration if he had possessed probity; but his want of principle, and his unruly passions, led him to commit many grievous errors, which contributed not a little to produce or aggravate those calamities which latterly overtook him.

DECLINE OF ATHENIAN INDEPENDENCE.

With Alcibiades perished the last of the great men who possessed the power to sway the wild democracy, or, properly speaking, the mob of Athens. From the period of his death till the subjugation of the country, the Athenian people were at the mercy of contending factions, and without a single settled principle of government. During this brief period of their history, in which a kind of popular democracy had attained the command of affairs, happened the trial and condemnation of Socrates, an eminent teacher of morals, and a man guiltless of every offence but that of disgracing, by his illustrious merit, the vices and follies of his contemporaries. On the false charge of corrupting the morals of the pupils who listened to his admirable expositions, and of denying the religion of his country, he was, to the eternal disgrace of the Athenians, compelled to die by drinking poison, a fate which he submitted to with a magnanimity which has rendered his name for ever celebrated. This odious transaction occurred in the year 400 B. C.

After the death of this great man, the political independence of Athens drew to its termination—a circumstance which cannot excite the least surprise, when we reflect on the turbulence of its citizens, their persecution of virtue and talent, and their unhappy distrust of any settled form of government. Their ruin was finally accomplished by their uncontrollable thirst for war, and can create no emotions of pity or regret in the reader of their distracted history. The Lacedæmoi under the command of an able officer named Lysa attacked and totally destroyed the Athenian fleet. this means having obtained the undisputed com of the sea, Lysander easily reduced those citi the coasts of Thrace and Asia Minor, and those is of the Ægean, which still acknowledged the s macy of Athens. Having thus stripped that lordly state of all its dependencies, he proceed blockade the city of Athens itself. The Athe made a heroic defence; but after a lengthened during which they suffered all the horrors of fa they were obliged to surrender on such conditio their enemies thought fit to impose (404 B. C.) Spartans demanded that the fortifications of Pi and the long walls which connected it with the should be demolished; that the Athenians shoul linquish all pretensions to authority over their fo tributaries, recall the exiled partisans of the 400 ty acknowledge the supremacy of Sparta, and foll commanders in time of war; and, finally, that should adopt such a political constitution as should the approbation of the Lacedæmonians. Thus sar power of Athens, which had so long been the le state of Greece, and thus terminated the Peloponn war, in which the Grecian communities had be long engaged, to little other purpose than to wast strength and exhaust the resources of their cor country.

Condition of Athens.

During the age preceding its fall, Athens, as al mentioned, had been greatly beautified and enlarg Pericles. At the same time, the comparative si city of manners which formerly prevailed, wa changed for luxurious habits. This alteratio been described by an able historian.* "In the c of a few years, the success of Aristides, Cimon Pericles, had tripled the revenues, and increased far greater proportion the dominions of the rep The Athenian galleys commanded the eastern coa the Mediterranean; their merchantmen had engr the traffic of the adjacent countries; the magazi Athens abounded with wood, metal, ebony, ivory all the materials of the useful as well as of the a able arts; they imported the luxuries of Italy, S Cyprus, Lydia, Pontus, and Peloponnesus; exper had improved their skill of working the silver mi mount Laurium; they had lately opened the val marble veins in mount Pentelicus; the honey of Hy tus became important in domestic use and foreign tr the culture of their olives (oil being long their s commodity, and the only production of Attica v Solon allowed them to export) must have impr with the general improvement of the country ir and agriculture, especially under the active admin tion of Pericles, who liberally let loose the public sure to encourage every species of industry.

But if that minister promoted the love of actio found it necessary at least to comply with, if not t cite, the extreme passion for pleasure, which then b to distinguish his countrymen. The people of At successful in every enterprise against their forei well as domestic enemies, seemed entitled to rea fruits of their dangers and victories. For the spa at least twelve years preceding the war of Peloponn their city afforded a perpetual scene of triumph festivity. Dramatic entertainments, to which they passionately addicted, were no longer performed in s unadorned edifices, but in stone or marble the erected at great expense, and embellished with most precious productions of nature and of art. treasury was opened, not only to supply the decora of this favourite amusement, but to enable the pc citizens to enjoy it, without incurring any privat pense; and thus, at the cost of the state, or rath its tributary allies and colonies, to feast and de their ears and fancy with the combined charms of n

* History of Ancient Greece, by J. Gillies.

and poetry. The pleasure of the eye was peculiarly consulted and gratified in the architecture of theatres and other ornamental buildings; for as Themistocles had strengthened, Pericles adorned, his native city; and unless the concurring testimony of antiquity was illustrated in the Parthenon, or Temple of Minerva, and other existing remains worthy to be immortal, it would be difficult to believe that in the space of a few years there could have been created those numerous yet inestimable wonders of art, those temples, theatres, statues, altars, baths, gymnasia, and porticoes, which, in the language of ancient panegyric, rendered Athens the eye and light of Greece.

Pericles was blamed for thus decking one favourite city, like a vain voluptuous harlot, at the expense of plundered provinces; but it would have been fortunate for the Athenians if their extorted wealth had not been employed in more perishing, as well as more criminal, luxury. The pomp of religious solemnities, which were twice as numerous and costly in Athens as in any other city of Greece; the extravagance of entertainments and banquets, which on such occasions always followed the sacrifices; the increase of private luxury, which naturally accompanied this public profusion—exhausted the resources, without augmenting the glory, of the republic. Instead of the bread, herbs, and simple fare recommended by the laws of Solon, the Athenians, soon after the eightieth Olympiad, availed themselves of their extensive commerce to import the delicacies of distant countries, which were prepared with all the refinements of cookery. The wines of Cyprus were cooled with snow in summer; in winter, the most delightful flowers adorned the tables and persons of the wealthy Athenians. Nor was it sufficient to be crowned with roses, unless they were likewise anointed with the most precious perfumes. Parasites, dancers, and buffoons, were a usual appendage of every entertainment. Among the weaker sex, the passion for delicate birds, distinguished by their voice or plumage, was carried to such excess as merited the name of madness. The bodies of such youths as were not peculiarly addicted to hunting and horses, which began to be a prevailing taste, were corrupted by a lewd style of living; while their minds were still more polluted by the licentious philosophy of the sophists. It is unnecessary to crowd the picture, since it may be observed, in one word, that the vices and extravagances which are supposed to characterise the declining ages of Greece and Rome, took root in Athens during the administration of Pericles, the most splendid and most prosperous in the Grecian annals."

During this period flourished Æschylus and Sophocles, Euripides and Aristophanes, dramatists; Pindar, a lyrical poet; Herodotus and Thucydides, historians; Xenophanes, Heraclitus, Empedocles, Anaxagoras, and Socrates, philosophers (reasoners upon the nature of the human mind, and upon man's immortal destiny). In this period, also, under the administration of Pericles (from 458 to 429 B. C.), sculpture and architecture attained their perfection. It was then that Phidias executed those splendid works, statues of the gods and goddesses, which excited the admiration of the world, and which succeeding artists have in vain endeavoured to rival. While Athens had extended its power over a great part of the coasts of the Ægean Sea, and increased its trade and commerce by every available means, it had also become a city of palaces and temples, whose ruins continue to be the admiration of ages for their grandeur and beauty. It is understood that the Greeks had acquired their knowledge of architecture from the Egyptians, but they greatly excelled them in the elegance of their designs, and are in a great measure entitled to the character of inventors in the art. The beauty of the Corinthian pillar, for example, has never been excelled either in ancient or modern times. [See ARCHITECTURE.]

After the surrender of Athens to the Spartans (404 B. C.), the democratical constitution was abolished, and the government was entrusted to thirty persons, whose tyrannous, oppressive, and bloody administration, ere long procured them the title of the Thirty Tyrants. The ascendancy of these intruders was not, however, of long duration. Conon, assisted privately by the Persians, who were desirous of humiliating the Spartans, expelled the enemy, and re-established the independence of his country. Seventy years later, a new source of agitation throughout Greece was caused by the warlike projects of Alexander, king of Macedon, usually styled

Alexander the Great.

This intrepid and ambitious soldier was the son of Philip, king of Macedon, a small territory adjacent to the Grecian states, from which it had originally received a knowledge of arts and learning. Alexander was born in the year 356 B. C., and by his father was committed to the charge of the philosopher Aristotle to be educated, a duty which was faithfully fulfilled. By the assassination of Philip, Alexander was called to the throne of Macedon while yet only twenty years of age, and immediately had an opportunity of displaying his great warlike abilities in conducting an expedition into Greece, which was attended with signal success, and procured for him the honour of succeeding his father as commander-in-chief of the Grecian states. He now carried out a design which had been formed by Philip, to subdue Persia and other countries in Asia. In the spring of 334 B. C., he crossed over to the Asiatic coast, with an army of 30,000 foot and 5000 horse, thus commencing the most important military enterprise which is narrated in the pages of ancient history. Alexander marched through Asia Minor, and in successive encounters completely conquered the armies of Persia; but the whole history of his progress is but an account of splendid victories. During a space of about seven or eight years, he conquered Persia, Assyria, Egypt, Babylonia, and, in fact, became master of nearly all the half civilised countries in Asia and Africa. It does not appear that Alexander had any motive for this wide-spread overthrow of ancient and remote sovereignties, excepting that of simple ambition, or desire of conquest, with, perhaps, the indefinite idea of improving the social condition of the countries which he overran. From various circumstances in his career, it is apparent that he never contemplated the acquisition of wealth or of praise, except such as could be shared with his soldiers, for whom he displayed a most paternal affection. His character in this respect shines forth in a remarkable speech which he delivered to his army after these great conquests, and when some mutinous murmurs had broken forth in his camp. Mounting the tribunal, he spoke as follows:—"It is not my wish, Macedonians, to change your resolution. Return home, without hindrance from me. But, before leaving the camp, first learn to know your king and yourselves. My father Philip (for with him it is ever fit to begin) found you, at his arrival in Macedon, miserable and hopeless fugitives; covered with skins of sheep; feeding among the mountains some wretched herds which you had neither strength nor courage to defend against the Thracians, Illyrians, and Triballi. Having repelled the ravagers of your country, he brought you from the mountains to the plain, and taught you to confide, not in your fastnesses, but in your valour. By his wisdom and discipline, he trained you to arts and civility, enriched you with mines of gold, instructed you in navigation and commerce, and rendered you a terror to those nations at whose names you used to tremble. Need I mention his conquests in Upper Thrace, or those, still more valuable, in the maritime provinces of that country? Having opened the gates of Greece, he chastised the Phocians, reduced the Thessalians, and, while I shared the command, defeated and humbled the Athenians and Thebans, eternal foes to Macedon, to whom you had been successively tributaries, subjects, and slaves. But my father rendered you their masters; and having entered the Peloponnesus, and regulated at discretion the affairs of that peninsula, he was appointed, by universal consent,

general of combined Greece; an appointment not more honourable to himself than glorious for his country. At my accession to the throne, I found a debt of five hundred talents, and scarcely sixty in the treasury. I contracted a fresh debt of eight hundred; and conducting you from Macedon, whose boundaries seemed unworthy to confine you, safely crossed the Hellespont, though the Persians then commanded the sea. By one victory, we gained Ionia, Æolia, both Phrygias, and Lydia. By our courage and activity, the provinces of Cilicia and Syria, the strength of Palestine, the antiquity of Egypt, and the renown of Persia, were added to your empire. Yours, now, are Bactria and Aria, the productions of India, the fertility of Assyria, the wealth of Susa, and the wonders of Babylon. You are generals, princes, satraps. What have I reserved for myself but this purple and diadem, which mark my pre-eminence in toil and danger? Where are my private treasures? Or why should I collect them? Are *my* pleasures expensive? You know that I fare worse than any of yourselves; and have in nothing spared my person. Let him, who dares, compare with me. Let him bare his breast, and I will bare mine. My body, the fore part of my body, is covered with honourable wounds from every sort of weapon. I often watch, that you may repose safely; and to testify my unremitting attention to your happiness, had determined to send home the aged and infirm among you, loaded with wealth and honour. But since you are all desirous to leave me, go! Report to your countrymen, that, unmindful of the signal bounty of your king, you entrusted him to the vanquished barbarians. The report, doubtless, will bespeak your gratitude and piety."

This impassioned and touching oration deeply affected the discontented soldiers, and all gladly returned to their allegiance. Shortly after this, the extraordinary career of Alexander was suddenly cut short by death. At Babylon, while engaged in extensive plans for the future, he became sick, and died in a few days, 323 B.C. Such was the end of this conqueror, in his thirty-second year, after a reign of twelve years and eight months. He left behind him an immense empire, which, possessing no consolidated power, and only loosely united by conquest, became the scene of continual wars. The generals of the Macedonian army respectively seized upon different portions of the empire, each trusting in his sword for an independent establishment. The greedy struggle for power finally terminated in confirming Ptolemy in the possession of Egypt; Seleucus in Upper Asia; Cassander in Macedon and Greece; while several of the provinces in Lower Asia fell to the share of Lysimachus.

CONCLUDING PERIOD OF GREEK HISTORY.

At the death of Alexander, the Athenians considered it a fit opportunity to emancipate themselves from the ascendancy of Macedon, but without success. Demosthenes, one of the most eminent patriots and orators of Athens, on this occasion, to avoid being assassinated by order of Antipater, the Macedonian viceroy, killed himself by swallowing poison; and his compatriot Phocion was shortly afterwards put to death by his own countrymen, the Athenians, in a mad outbreak of popular fury. Greece cannot be said to have produced one great man after Phocion; and this deficiency of wise and able leaders was doubtless one chief cause of the insignificance into which the various states, great and small, sank after this epoch.

The ancient history of Greece, as an independent country, now draws to a close. Achaia, hitherto a small unimportant state, having begun to make some pretensions to political consequence, excited the enmity of Sparta, and was compelled to seek the protection of Philip, the ruling prince of Macedon. Philip took the field against the Spartans, and their allies the Ætolians, and was in a fair way of subjecting all Greece by arms and influence, when he ventured on the fatal step of commencing hostilities against the Romans. This measure consummated the ruin of Greece, as well as that of Macedon. The Romans warred with till the end of his life (175 B.C.), and continu contest with his son Perseus, whom they utte feated, and with whom ended the line of the k Macedon. In a few years, the once illustrious a republics of Greece were converted into a Rom vince under the name of Achaia (146 B.C.)

Thus terminates the fourth and last period of history, during which there flourished several e writers and philosophers, among whom may b bered Theocritus, a pastoral poet; Xenophon, P Diodorus Siculus, Dionysius Halicarnassus, Pl and Herodian, historians; Demosthenes, an and Plato, Aristotle, Zeno, and Epicurus, philos also Zeuxis, Timanthes, Pamphilus, Nicias, and Eupompus, painters; and Praxiteles, Pol Camachus, Naucides, and Lysippus, sculptors.

In the condition of a humble dependency of and therefore following the fate of that empire, remained for upwards of four succeeding cer but although of little political importance, it tained its pre-eminence in learning. Enslaved land was, it continued to be the great school of tl As Greece had formerly sent its knowledge a over the east by the arms of one of her own kir now diffused them over the western world un protection of Rome. Athens, which was the em of Grecian learning and elegance, became the r all who were ambitious of excelling either in kn or the arts; statesmen went thither to improv selves in eloquence; philosophers to learn the of the sages of Greece; and artists to study m excellence in building, statuary, or painting; na Greece were also found in all parts of the worl ing an honourable subsistence by the superio ledge of their country. That country, in the me was less disturbed by intestine feuds than forme was not exempt from the usual fate of conquest subject to the continual extortions of governo lieutenants, who made the conquered provin means of repairing fortunes which had been br flattering the caprices of the populace at home.

The period of the independence of Greece, which all those great deeds were performed whi attracted the attention of the world, may be r from the era of the first Persian war to the c of Macedon, the last independent Greek state, Romans. This period, as we have seen, embrac more than three hundred years. It is not, th from the duration of the independent politica of the Grecian states that their celebrity arises. the patriotism of their soldiers, and the devoted l of Thermopylæ and Marathon, have been e elsewhere, without attracting much regard; must therefore conclude that it is chiefly from tl riority of its poets, philosophers, historians, and that the importance of the country, in the eyes of men, arises. The political squabbles of the At are forgotten; but the moral and intellectual res of their philosophers, and the elegant remains artists, possess an undying fame.

We now turn to the history of the Romans, b the Grecian states were finally overpowered.

HISTORY OF ROME.

MONARCHY AND REPUBLIC.

About the time when Lycurgus was settling stitutions of Sparta, Italy was possessed by a tribes, some of which, from the traces of their la and arts which have been preserved, appear t been of eastern origin, being probably colonic Greece and Asia Minor. The Etrurians, who o modern Tuscany, were the most refined of thes In the country of the Latins, more to the south middle of the eighth century before Christ, settlement was formed on a hill near the Tiber, the conduct, it is said, of a youthful leader nam

system of mythology. Like the Greeks, also,

Roman citizen.

they dressed themselves in a simple manner, with a loose mantle, or toga, over a kind of kilt, which left the legs exposed. At the outset, their dependence was almost entirely on agriculture; but for the cultivation of the peaceful arts generally, they seem to have possessed no taste. War and plunder were their favourite pursuits, in which they far exceeded the Greeks, and almost all other nations of ancient or modern times. Their language, founded on the Greek, was that since known as the Latin, a term derived from Latium, the early of the country in which Rome was situated.

ring the early period of its history, the Roman
nment was monarchical, but restricted by a senate
opular assembly, and therefore favourable to social
ncement. From Romulus is reckoned a series of
kings, the ablest of whom, Servius Tullius, placed
e at the head of the small states forming what has
called the Latin confederacy, and considerably
oved the municipal institutions of the kingdom.
last of the seven kings of Rome was Tarquinius,
named the Proud. His son Sextus having committed an atrocious act of violence on Lucretia, the wife of Collatinus, she, unable to survive the dishonour, killed herself. By this transaction, the disgust of the people with their royal family, and with monarchy in general, was brought to a head; and under a noble Roman named Brutus, they rose and expelled Tarquinius, with all his family. Thus ended the regal power in Rome, in the year before Christ 509.

THE REPUBLIC.

The monarchy was succeeded by a republic, in which the chief legislative authority rested with the senate, and the liberties of the people were very little improved. The executive was committed to two magistrates of equal authority, named *consuls*, who were chosen annually. Brutus, who had distinguished himself in expelling the royal family, was chosen one of the two first consuls. During the time he held office, his two sons joined in a conspiracy to restore Tarquin, and Brutus, with a disregard of his own affections, which was considered a great virtue in Greece and Rome when the public interest was concerned, condemned them both to be beheaded in his presence.

The early years of the republic were marked by great struggles between the patrician, or noble order, and the common people. The vigour and perseverance with which the latter sought to emancipate themselves from the authority of the former, compose a striking picture in ancient history, and convey the impression that there were here elements of character superior to what existed at the time in any other nation besides the Greeks. It would be wearisome, however, to detail the various contentions. From the beginning, the plebeians showed a tendency to acquire the mastery. By "the Valerian law," they acquired the right of giving a final judgment on any person condemned by a magistrate. Their importance in composing armies also helped to give them influence. By seizing an opportunity when the patricians were in difficulties from foreign aggression (493 B.C.), they obtained the right of appointing *tribunes* (at first five in number, afterwards ten), who had the power of suspending the decrees of the senate and the sentences of the consul, and had a general charge over the interests of the common people. The power enjoyed by the plebeians at this time is marked by their causing the celebrated Coriolanus to be sent into banishment, his splendid military services being insufficient to atone for his openly espousing the cause of the patricians, and expressing contempt for the people. By the "law of Volero," which gave the people the right of assembling in comitia, and there discussing public affairs, without the decree of the senate—a measure equivalent to parliament assembling without the king's writ—the government of Rome became essentially democratic. (471 B.C.)

As yet the Romans had had no written law. The kings, and after them the consuls, had administered justice each according to his own sense. In the year 451 B.C., at the suggestion of a tribune named Tertullian, ten men (*decemviri*) were appointed to frame and digest a code of laws for the explanation and security of the rights of all orders of the state. The result was the formation of what have been called the *Twelve Tables of the Roman law*, to learn which by heart was a part of liberal education in ancient Rome.

On the appointment of the decemviri, the consuls were discontinued. Each of the ten men acted as supreme magistrate for a day, the nine others officiating as judges. They did not, however, remain long in authority. One of the number, named Appius Claudius, having formed a base design against a maiden named Virginia, daughter of Virginius, a centurion, and affianced to Icilius, caused her to be claimed as his slave, and, as decemvir, gave judgment in his own favour. When Virginius saw his daughter about to be sacrificed to a profligate monster, he seized a knife from a butcher's stall in the Forum, and stabbed her to the heart. The people rose in fury against Appius, who escaped for the time, but at length only avoided punish-

ment by committing suicide. This event caused the abolition of the decemvirate, after it had lasted only three years. The consuls and tribunes were then restored.

The violent struggles of the patricians and plebeians did not prevent Rome from gradually acquiring an ascendancy among the Italian states. The armies of Rome, unlike all others in those early times, were standing armies: the soldiers had regular pay, and made arms a profession. Their compact and well-organised force, meeting in general only ill-disciplined militia, carried every thing before it.* Veii, a state which had long defied and rivalled them, fell before their general Camillus (396 B.C.) In 385 B.C., they finally reduced the Gauls, a powerful branch of the Celtic race inhabiting the north of Italy. They then fought and subdued the Samnites. Other states fell beneath their powerful arms, and in the year 274 B.C., they had acquired the complete mastery of all Italy.

Wars with Carthage.

A splendid victory which they had gained near the close of the Italian wars over Pyrrhus, king of Epirus, who had come to aid the Samnites, led the Romans to believe that they might extend their conquests to countries beyond Italy. Sicily, originally a Greek colony, was at this time important for the great quantities of grain produced in it. The Carthaginians, an enterprising commercial people, occupying a tract of country in the north of Africa, were anxious to obtain possession of this island; but the Romans were inclined to dispute the prize. They fitted out a fleet, the first they ever had, and sent a large force to aid the Sicilians, who were friendly to them, in expelling the Carthaginians. Agrigentum, a great city in Sicily, was taken, after a long siege, by the joint forces of Rome and Syracuse; and the Roman fleet gained a complete victory over that of Carthage (260 B.C.) These successes were followed by the reduction of Corsica and Sardinia. The Roman fleet then sailed against Carthage itself: the Carthaginians were at first about to submit, but, inspirited by a timely aid from Greece, they made a strong effort to repel the Roman army, in which they were successful, at the same time taking Regulus, the Roman commander, a prisoner. Some time afterwards, when repeated defeats in Sicily made them desirous of peace, they allowed Regulus to go to Rome to help in negotiating it, under a solemn promise to return if the treaty should fail. It was rejected, at the urgent desire of Regulus himself, as discreditable to Rome, and he then deliberately returned to surrender his life to the enraged Carthaginians. After some further successes on the part of the Romans, the Carthaginians submitted to a humiliating peace (241 B.C.), surrendering Sicily, and agreeing to pay a large sum of money. Sicily, excepting the kingdom of Syracuse, now became a province of Rome, being the first out of Italy which

* A Roman army, in its perfect state, included infantry and cavalry. The heavy-armed infantry, which was its principal strength, was divided into ten cohorts and fifty-five companies, under the orders of a corresponding number of tribunes and centurions. The first cohort, which always claimed the post of honour and the custody of the eagle, was formed of 1105 soldiers, the most approved for valour and fidelity. The remaining nine cohorts consisted each of 555; and the whole body of the legion amounted to 6100 men. Their arms were uniform, and admirably adapted to the nature of their service: an open helmet, with a lofty crest; a breast-plate, or coat of mail; greaves on their legs; and an ample buckler on their left arm. Besides a lighter spear, the legionary soldier grasped in his right hand a formidable javelin, which he threw at his foe at the distance of ten or twelve paces. As soon as it was darted, he drew his sword, and rushed forwards to close with the enemy. His sword was a short well-tempered blade, that carried a double edge, and was alike suited to the purpose of striking or pushing. It was by this short sword, which was little more than double the length of our modern table-knives, that the Romans conquered the world. The legion was usually drawn up eight deep, and the regular distance of three feet was left between the files, as well as ranks. The legions entrenched themselves in a camp in regular form every night while out on duty, and the remains of these square earthen ramparts are still observable in Britain, and most other countries they visited.

acquired.

Twenty-three years of peace recruited the power Carthage, and enabled her to renew hostilities w Rome. Under the celebrated Hannibal, a large ar proceeded through Spain and Gaul, crossed the Al and descended on the plains of Italy. The Romans four battles in succession, the last being that of Cann in which 40,000 of their soldiers, and nearly the wh of their knights (or soldiers of the patrician order), said to have fallen. If Hannibal had instantly marc to Rome, it is believed that he would have gained p session of it, and probably given a new turn to t world's history. He deliberated, and the Romans h time to concentrate all their remaining strength agai him. Under their general, Fabius, they pursued policy which has since become proverbial, avoidi battle, and exhausting the enemy's strength by del The war ended (202 B.C.) by their gaining Syracu reducing Spain, and taking from Carthage her prisone her fleet, and a vast sum of money.

A third war with Carthage, springing expressly fr the ambition of the Roman people, began in the y 149 B.C., and ended, three years after, in the compl destruction of that city and people. Carthage was thoroughly destroyed, that its very site is now matt of uncertainty. In consequence of this success, a lar part of northern Africa became tributary to Rome.

Some years before, the Romans had carried th arms into Greece and Asia Minor. Macedonia, wh kings had not long before conquered Persia, India, a Egypt, became tributary to Rome, and Lesser As became one of her provinces. The same year in whi the Romans destroyed Carthage, saw Greece subject to them. Thus, in less than a century, they had co quered the greater number of the countries lying arou their own comparatively small state.

Insurrection of the Gracchi.

These triumphs were not an unmixed good. T people were intoxicated with success. Vast wea arising from spoil, but accumulated chiefly in the ha of the nobility, led to great luxury, and furnished means of corrupting the people. The overgrown est and power of the senators produced great discont at the same time that it made the citizens venal. this time (130 B.C.) arose Tiberius and Caius Gracc two noble youths, whose zeal to reform the gro corruptions of the state precipitated them at length measures destructive of all government and social ord Tiberius, the elder brother, urged the people to ass by force, the revival of an ancient law, limiting p perty in land, and thus abridging the estates of patricians. A tumult was the consequence, in whi Tiberius and 300 of his friends were killed in Forum. Caius Gracchus then took up the cause of people, and, notwithstanding every opposition, w enabled to abridge the power of the senate, to prot the people from monopolists in corn, and extend rights of Roman citizenship. Employing, like h brother, the dangerous engine of tumultuary force, fell a victim to it himself, with 3000 of his partis who were slaughtered in the streets of Rome. Th tumults attending the sedition of the Gracchi were th prelude to those civil disorders which now followed quick succession to the end of the commonwealth.

It may here be remarked, that Roman liberty, which we hear so much, rather refers to the resistan which was offered to monarchical and aristocratic re in the early days of Rome, than to the actual conditi of the people as individuals at any period. With mu liberty as to public and national matters, there was great deal of domestic restraint. Slaves, the prisone taken in battle, or the descendants of such, formed ea half of the population of Rome. This portion of th inhabitants had no political rights whatever: their civ rights were so much curtailed, that they could contra no legitimate marriage, were not admitted to give evi dence in law, and could not bequeath their property

ht be flogged, and even put to death, at the of their masters. It was not mere labourers e in this condition, but clerks, overseers, and cquainted with literature. Even among those y free, and who had the right of citizenship, rere not themselves rich were obliged to attach es to some nobleman, or *patrician*, as their r, and were called *his clients*. Without the influence of such a person to enforce his Roman citizen would have been excommuni- d defenceless. The tie between a patron and ts in Rome was as close, and as little flattering nferior party, as that between a chieftain and men in more recent times. The rich men kept er citizens in pay, and almost in subsistence, sake of their votes in the public assemblies; is class lost their habits of industry, and, being to live in miserable dependence on the largesses ealthy and ambitious, became idle and dissi- ous respectable even than the slaves. There eneral caressing of the populace by all who d to be candidates; shows, entertainments, dis- s of corn, were continually proposed or offered r other, to keep them in good humour; and a ar system of bribery was practised when the s came to be decided. Hence Cicero calls the *plebs urbana*) "the scum and dirt of the town," ndoned mob," "lean miserable leeches;" and arose from a humble and inconsiderable class le having votes to sell, which it became the inte- the rich to buy. The slaves, and freed men, who by far the most numerous part of the working had of course no votes; and being maintained erished only in proportion to their industry and , were many of them a confidential and esteemed mong wealthy people in Rome; while the citizens ad hereditary political rights were fed and de-

Sylla—Pompey—Cæsar.

he proportion in which Rome became a military its commanders acquired a dangerous influence affairs. Sylla and Marius, two of these com- rs, were rivals in the desire of power. The r, while commanding in a war against Mithridates, f Pontus, was superseded and recalled from Asia. fused to obey the mandate, and, finding his army ed to support him, he led it to Rome, expelled n and all his partisans, and for a time reigned plant. The desolate condition of the exiled n, sitting amongst the ruins of Carthage, is often d to. After Sylla had returned to pursue the ith Mithridates, his rival, recovering strength, more acquired an ascendancy in Rome, but was ely cut off in a fit of debauch. Sylla, now victo- in Asia, returned to Italy, and, being joined by s, Cethegus, and the young Pompey, gave battle party of his enemies, and entirely defeated them. ntry into Rome was signalised by a dreadful ere, and a proscription, which had for its object termination of every enemy whom he had in Elected *dictator*, with the unlimited authority ed to that office (one of occasional creation), he with a degree of conscientiousness that could ly have been expected from one who had shed ch blood. He restored the senate to its judicial city, regulated the election to all the important of the state, and enacted many excellent laws t oppression and the abuse of power. He then arily resigned his dictatorship, and, retiring to ndition of a private citizen, offered publicly to n account of his conduct. Not long after, he died effects of debauchery. Sylla may be reckoned uitable example of that union of great vices with points of character, which marks a time of semi- tion. Before the close of Sylla's career, Julius , a young man of high birth and great talents, was into notice. The chief power in the state was l between Pompey and Crassus; when Cæsar, by r-stroke of policy, caused himself to be associated with them in what was called a Triumvirate, or govern- ment of three persons. He now subdued Transalpine Gaul (including the present Belgium and France), and, passing over to Britain (54 B.C.), also reduced the people of that country, which the Romans considered as one of the remotest corners of the earth. By the death of Crassus, Cæsar and Pompey were left sole rivals for power. The high military reputation of Cæsar gave him great popular influence, but Pompey was befriended by the consuls and a majority of the senate. A decree was passed, forbidding Cæsar to pass, with his army, the brook Rubicon, which divided Gaul from Italy: he nevertheless did cross the stream and advance to Rome, of which he immediately gained the mastery, Pompey retiring into Greece. Cæsar, marching into Spain, overthrew Pompey's lieutenants there, and at his return found he had been declared dictator. Then, learning that Pompey had raised a large army in Illyria, he marched thither, and, at the decisive battle of Pharsalia, extinguished the hopes of his rival (49 B.C.) Pompey, who had divided the empire of the civilised world, fled as a dispirited and powerless fugitive to seek the assistance and hospitality of Ptolemy and Cleopatra, in Egypt, but was barbarously murdered the instant he stepped on shore. From the death of Pompey is to be dated the total overthrow of the Roman republic. The corruptions of the state had become too great to admit of any other cure than that of an absolute govern- ment. From this period, therefore, the senate and democratic bodies were dispossessed of all power, and Rome was never without a master.

THE EMPIRE.

Condition of the nation.

At the period when the commonwealth passed into the hands of an absolute monarch, the Romans had attained the height of their power. Directing their main energies to military conquest, they had enjoyed some centuries of glory, with every kind of plunder which the conquered countries could produce. Every district in Europe, Asia, and Africa, lying within reach of the Roman legions, had become tributary to Rome. At this period, the nation reckoned about 7,000,000 of citizens, with twice as many provincials, besides as many slaves. From being an obscure town, Rome had become a wide-spread city, and was adorned with majestic temples, public edifices and pa- laces. Other towns in Italy also rose into importance, and became the residence of distinguished Roman citizens. The public monuments of this remarkable people were placed, not only in the capital, but all over the provinces; and some of them are till this day reckoned among the greatest wonders of art. But the stupendous character of their undertakings was chiefly seen in their roads. All the cities of the empire were connected with each other, and with the capital, by public highways, which, issuing in various directions from the Forum—or great central place of public as- sembly—of Rome, traversed Italy, pervaded the pro- vinces, and were terminated only by the frontiers of the empire. On the north-west, the boundary of this extensive empire was the wall of Antoninus, built be- twixt the Firths of Clyde and Forth, in Scotland, and on the south-east it was the ancient city of Jerusalem. If the distance between these two points be carefully traced, it will be found that the great chain of commu- nication was drawn out to the length of 4080 Roman miles, or 3740 English measure. "The public roads (says Gibbon) were accurately divided by mile-stones, and ran in a direct line from one city to another, with very little respect for the obstacles either of nature or private property. Mountains were perforated, and bold arches thrown over the broadest and most rapid streams. The middle part of the road was raised into a terrace, which commanded the adjacent country, con- sisted of several strata of sand, gravel, and cement, and was paved with large stones, or, in some places near the capital, with granite. Such was the solid construction of the Roman highways, whose firmness has not entirely

yielded to the effort of fifteen centuries. They united the subjects of the most distant provinces by an easy and familiar intercourse; but their primary object had been to facilitate the marches of the legions: nor was any country considered as completely subdued, till it had been rendered, in all its parts, pervious to the arms of the conqueror. The advantage of receiving the earliest intelligence, and of conveying their orders with celerity, induced the emperors to establish, throughout their extensive dominions, the regular institution of posts. Houses were every where erected at the distance of only five or six miles; each of them was constantly provided with forty horses, and, by the help of these relays, it was easy to travel 100 miles in a day along the Roman roads." By these means the Romans maintained their ascendancy in every country, and diffused through the whole empire the improvements of social life. There was thus a nobleness and grandeur in various circumstances connected with the Roman sway, which by a moderate, firm, and enlightened system of government, might have ultimately proved of the greatest importance in the social advancement of mankind. It was most unfortunate, however, both for this sacred cause and for the welfare of the Roman people themselves, that the plan of enriching the commonwealth at the seat of power, consisted almost exclusively in robbing foreign territories—a plan which it is impossible ever can permanently exist in any country, whatever be its power. Besides, with all the encouragement given to the fine arts, such as architecture, sculpture, and the production of luxuries, there was no substantial industry or commerce, and no means were taken to enlighten and refine the community, by science, literature, or morals. The whole fabric of Roman greatness, in fact, rested on no sure foundation, and its gradual decline and fall, from the extinction of the republic, cannot excite the smallest degree of surprise.

The Twelve Cæsars.

The successes of Cæsar placed him at the head of the Roman world. His only remaining opponent was Cato, who has been described as one of the most faultless characters in Roman history. This eminent patriot was, however, unable, by force of arms, to restore the liberties of the people, or to arrest Cæsar in his victorious and ambitious career. Being at last deserted by his friends, and dreading to fall into the hands of his enemy, after pondering a while on the nature of the immortality of the soul, he stabbed himself with his own sword—an act which Roman morality held as perfectly justifiable, and which was committed by many of the first characters of the state, when they happened to be deserted by fortune. After the death of Cato, Cæsar was without a rival. Returning to Rome in triumph, he established his power as dictator, and shortly afterwards received the title of *imperator*, or emperor, with full powers of sovereignty. The assumption of these dignities, as may be supposed, served to unite the friends of the republican form of government, or at least all who had thriven on the diseases of the state, with the view of making away with the usurper. A deep-laid conspiracy was accordingly formed against Cæsar, composed of sixty senators, at the head of whom was Decimus Brutus, whose life Cæsar had spared after the battle of Pharsalia, and Cassius, who was pardoned soon after. Cæsar was privately made acquainted with the existence of plots against his life; but, being of a fearless disposition, he proceeded, on the day intended for the fatal blow, to the senate-house. Here, by a preconcerted signal, he was stabbed behind in the shoulder by Casca. All the conspirators now rushed forward, and he received a second stab in the breast, while Cassius wounded him in the face. In this emergency, he defended himself with great vigour, rushing among them, and throwing down such as opposed him, till he saw Brutus among the conspirators, who, coming up, struck his dagger into his thigh. From that moment, Cæsar thought no more of defending himself, but, looking upon the ungrateful assailant, cried out, "And you too, B Then, covering his head, and spreading his rob him, in order to fall with a greater decency, down at the base of Pompey's statue, after r twenty-three wounds from hands which he vai posed he had disarmed by his benefits. Thus d remarkable man, the best who ever aspired reignty in Rome, the victor in five hundred and the conqueror of a thousand cities, in t sixth year of his age (44 B.C.)

Upon the death of Cæsar, the conspirato unable to form a government, or to inspire co in their designs; and in the distractions which Mark Antony, an ambitious man and formerl tenant of Cæsar, endeavoured to raise himsel supreme command. In this effort he was not ful. Octavius, grand-nephew and adopted son o also came forward as a candidate for power; likewise did a third personage, named Lepidus, one of these ambitious men possessed sufficie to attain supreme command, they entered into tion, forming a tripartite power, termed a triu Being opposed by Brutus, a dreadful civil war the atrocities of which are scarcely paralleled in Brutus was ultimately killed, after which e triumvirate quarrelled among themselves, and C by force of arms, becoming conqueror, attai dignity of emperor of Rome.

Julius Cæsar's successors.

On arriving at this proud eminence, Octavi called Augustus Cæsar,* relinquished the a designs of his predecessors; he endeavoured solidate the empire, instead of extending it t bounds, and introduced a spirit of moderat the public councils hitherto unknown. Know taste of the Romans, he indulged them in t of seeing the appearance of a republic, while h them really happy in the effects of a most absol narchy, guided by the most consummate p Historians delight in recounting the number deeds of Augustus, and the glories of his ti from him the phrase of "the Augustan age," by writers to periods in the history of nations able for the prosperity and refinement which p has been derived. It was in the twenty-fifth the reign of this magnanimous prince that Jesu was born, in the Roman province of Judea. In t 14 of our era, Augustus was succeeded by T a person of an entirely different character, an whom the corruptions of the state became very g the nineteenth year of his cruel reign, Christ cified, under Pontius Pilate, the Roman gove Jerusalem. In the year 37, Tiberius was put t by smothering him with pillows, or, as some hi allege, by poison; and he was succeeded by Ca person of vicious habits and still more cruel ch This emperor was prodigal and extravagant to almost inconceivable. The luxuries of former e were simplicity itself when compared to those w practised. He contrived new ways of bathing the richest oils and most precious perfumes we with the utmost profusion. He found out d immense value, and had even jewels, we a dissolved among his sauces. He sometimes h vices of pure gold presented before his guests of meat. But his prodigality was the most able in regard to his horse. He built for it a marble, and a manger of ivory. Whenever t mal, which he called Incitatus, was to run, h sentinels near its stable the night preceding, vent its slumbers from being broken. He a it a house, furniture, and a kitchen, in order all its visitors with proper respect. He so

* A number of the imperial successors of Julius Cæsar the title of *Cæsar*, in addition to their other designation same manner as we find the appellations of Pharaoh and were assumed by many of the Egyptian sovereigns. Th Cæsar has been curiously enough preserved until modern the title of *Czar*, which is given by the Russians to their n

it to his own table, and presented it with gilt
d wine in a golden cup. He often swore by
ty of his horse; and historians mention, that
d have appointed it to a consulship, had not
h prevented. Caligula perished by assassina-
ter a reign of less than four years; of him
een said, that nature seemed to have brought

stice and an appearance of decency were once
sumed.

reign of Trajan, the fourteenth emperor, almost
l the glories of Augustus (A. D. 107.) He ad-
l the empire to a greater degree of splendour than
hitherto attained. He pursued his military con-
into new regions, even to Hindostan, and added
r to the extent of the Roman territories; although
s not ultimately attended with any good effect.
s is distinguished as the greatest and the best
or of Rome. Having given peace and prospe-
the empire, he continued his reign, loved, ho-
d, and almost adored, by his subjects. A pillar
merating his great actions, erected in Rome, is
existence. His successor, Adrian, was also a
overeign, and was distinguished for his abilities
terary acquirements. After this period, the em-
e never again under the authority of any ruler
itable for his magnanimity. The greater part
successors of Adrian were dissolute and vicious
ir habits, and under them the empire waned to
w. The only one deserving to be noticed was
ntine, the forty-first emperor (A. D. 311.)

Introduction of Christianity.

the death of Constantius, the fortieth emperor,
queathed the sovereignty to his son Constantine,
g prince of promising abilities. In the attempt,
ver, to take possession of his inheritance, he was
ed by three contending rivals—Maxentius, who
ed in Rome, a person of cruel disposition, and a
ast supporter of paganism; Licinius, who com-
ed in the east; and Maximin, who also governed
of the eastern provinces. The first step taken
nstantine was an expedition with an army to
, to expel Maxentius. One evening, while the
was on its march, Constantine, who was of a
ative disposition, sat in his camp reflecting upon
certain fate of sublunary things, and the dangers
enterprise in which he was engaged. It was then,
ding to a fabulous legend of the Christian church,
s the sun was declining, there suddenly appeared
n of light in the heavens, in the form of a cross,
the inscription in the Greek language, "In this
ne!" So extraordinary an appearance did not
create astonishment and religious awe in the mind
nstantine, and he resolved forthwith to adopt the
ue persuasion of the hitherto persecuted Chris-
. On the day following, he caused a royal standard
made like that which he had seen in the heavens,
mmanded it to be carried before him in his wars,
ensign of victory and celestial protection. After
he consulted with several of the principal teachers
istianity, and made a public avowal of that sacred
ligion. Constantine having thus attached his sol-
rs to his interest, who were mostly of the Christian
, lost no time in entering Italy with 90,000 foot,
000 horse. With this large force, he fought with
and overcame Maxentius, and entered Rome in triumph. One of his first acts was to ordain that no criminal should for the future suffer death by crucifixion, which had formerly been the most usual way of punishing slaves convicted of capital offences. Edicts were soon after issued, declaring that the Christians should be eased from all their grievances, and received into places of trust and authority. Thus, the new religion was seen at once to prevail over the Roman empire, and, being associated with the state, the bishops and other clergy were endowed with an authority which had formerly been wielded by the priests of the ancient paganism.

Shortly after the establishment of Christianity (A. D. 321), Constantine executed a resolution of transferring the seat of government from Rome to Byzantium, or Constantinople, as it was afterwards called in honour of his name. As Greece and various provinces in Asia now formed a part of the Roman empire, it was believed that Constantinople would form a more central situation for the capital. Whatever truth there might be in this, the transfer, instead of proving in any respect advantageous, weakened the fabric of the state, and exposed it to a more speedy dissolution. Constantine died when above sixty years old, leaving a mixed character "of piety and credulity, of courage and cruelty, of justice and ambition," and was succeeded by his three sons, Constantine, Constantius, and Constans. These divided the empire among them, but it was subsequently united by Constantius, after a war of twelve years' duration. This union was of no long continuance. Theodosius, in the year 395, permanently divided the empire into the Eastern and Western Roman Empires, the capital of the former being Constantinople, and of the latter Rome. The history of these two divisions of the Roman territory now also separates; and following the usual practice of historians, we leave the Eastern or Byzantine empire to form the subject of a separate narrative, while we conclude with a few words upon the latter days of the old Roman or Western empire.

Destruction of the Roman empire.

For a considerable period, the Roman dominions were pressed upon on nearly all sides by ferocious tribes of barbarians. These were at first unknown to the Romans; but about the era of Constantine they had become formidable, and arose in such numbers, that the earth seemed to produce a new race of mankind, to complete the empire's destruction. Against such an enemy no courage could avail, nor abilities be successful; a victory only cut off numbers without a habitation and a name, soon to be succeeded by others equally desperate and obscure. The emperors who had to contend with this people, were most of them furnished neither with courage nor conduct. Constantius, Julian, Jovian, and Valentinian, successively endeavoured to arrest the tide of barbarism which set in; but they wanted both the personal energy and the stern soldiery of the early commonwealth to accomplish this desirable object. In the vain attempt to stop an immense inundation of Huns, Allanes, and Goths, from the extensive deserts of Tartary and Russia, the Roman armies were greatly weakened; so that the emperors, finding it difficult at last to raise levies in the provinces, were obliged to hire one body of barbarians to oppose another. This expedient had its use in circumstances of immediate danger; but when that was over, the Romans found it was as difficult to rid themselves of their new allies as of their former enemies. Thus, the empire was not ruined by any particular invasion, but sank gradually under the weight of several attacks made upon it on every side. When the barbarians had wasted one province, those who succeeded the first spoilers proceeded on to another. Their devastations were at first limited to Thrace, Mysia, and Pannonia; but when these countries were ruined, they destroyed Macedonia, Thessaly, and Greece, and thence they proceeded to Noricum. The empire was in this manner continually shrinking, and Italy at last became the frontier of its own dominion.

The valour and conduct of Theodosius in some measure retarded the progress of destruction; but, upon his death, the enemy became irresistible. A large body of Goths had been called in to assist the regular forces, under Alaric, their king; but what was brought in to stop the universal decline, proved the last mortal stab to the empire. This Gothic prince, from an ally became a dangerous foe; and finally marching to Rome, made himself master of the city, which he abandoned to be pillaged by his soldiers (A. D. 410.)

After this disastrous event, Rome was plundered several times, and Italy was overrun by barbarous invaders, under various denominations, from the remotest skirts of Europe. The inhabitants of Rome, who had sunk into the grossest vices by the overpowering influence of wealth and prosperity, were quite unable to make any defence. So debased had they become, or so ill regulated was the balance of wealth, that for many years the whole of the lower classes had been fed daily by the emperors from the public granaries. The power of the state was now entirely broken; the provinces were voluntarily abandoned, or they rebelled, or were seized by the nearest barbarous powers. At length the title of emperor of the west, which, on one occasion, was put up to public auction by the licentious soldiery, expired; and, to finish the melancholy account, one of the princes of the barbarians assumed the title of *king of all Italy*. "Such" (to quote the words of Goldsmith) "was the end of this great empire, that had conquered mankind with its arms, and instructed the world with its wisdom; that had risen by temperance, and that fell by luxury; that had been established by a spirit of patriotism, and that sank into ruin when the empire was become so extensive, that a Roman citizen was but an empty name." Its final dissolution took place in the 480th year of the Christian era, or 1232 years from the date of the foundation of Rome.

ROMAN LITERATURE.

Literature could scarcely be said to exist among the Romans till their conquests in Greece made them acquainted with the admirable productions of that country, and the custom arose of sending youths to be educated in Athens. In the second century before the Christian era, comic dramatic writing was cultivated by *Ennius* and *Plautus*, and after them by *Terentius*, a slave, whose first comedy, the Andria, was acted in the year 165 B.C. Of Roman tragic writing, no remains have come down to our times. The *elder Cato*, who flourished in the same century, is praised as a writer by those who came after him; but we have scarcely any remains of his compositions. Philosophical writing may be said to have arisen and at once reached its acme in *Cicero*, the celebrated orator (born 106, died 46 B. C.), beyond all question the greatest man in the department of letters to whom the Roman state gave birth. Besides many strictly philosophical treatises, he has left several works on rhetoric, and many orations and epistles.

A philosophical manner of relating events took its rise with *Sallustius* (born 68 B. C.), whose histories of the Jugurthan war and of the conspiracy of Catiline, though perhaps not free from prejudice, are considered as models of composition. The Commentaries of Cæsar, in which, with noble simplicity, he relates the history of his own campaigns, place him amongst the first Roman writers. *Livius*, who lived in the reign of Augustus, stands unrivalled amongst the Roman historical writers, being distinguished by consummate judgment in the selection of facts, perspicuity of arrangement, sagacious reflection, sound views of policy, and the most copious, pure, and eloquent expression. Of his history of Rome, written in 142 books, only 35 have reached us. Next to him, in the same department, is *Tacitus* (born A. D. 55), whose Annals of Rome, extending throughout the greater part of the first century, and his life of Agricola, the conqueror of Britain, are remarkable for acuteness of thought and concise style.

Lucretius, a dramatic, and *Catullus*, a lyric poet, were the principal writers of that kind who rose before the reign of Augustus. This reign was not onl by Livius, but by a cluster of poets, of unma cellence. *Virgilius*, a native of Mantua, wrote or pastoral dialogues, Georgics, or poetical tr agricultural subjects, and the Æneid, a hero poom. His style is remarkable for smoothn fine strain of feeling. *Horatius*, his contemp friend, composed odes, satires, and epistles never been excelled in felicity of phrase and matic point; the general strain of his writin and familiar. *Ovidius* was a most elegant, tho tious poet. *Tibullus*, *Propertius*, and *Martial*, the list of the principal Roman poetical writ *canus*, *Statius*, and *Silius Italicus*, flourished time, when luxuriance of ornament and a te conceit showed that the best days of the nati lect were past.

Plinius (born A. D. 23) was almost the on writer who treated of nature or science; he wa ciate of Tacitus, and has left behind him work celebrated. He was a diligent student of the of nature, both animate and inanimate, and h voted every spare moment to the noting dow and observations, he finally produced a volumi on Natural History, in thirty-seven books, reckoned the more valuable for its containing from many lost works. Pliny was unfortuna in the year 79, by an eruption from Vesuvi destroyed the city of Herculaneum, where l the time residing.

The Romans distinguished themselves in p only by spreading the doctrines of the Gree phers in a language more extensively underst principal writer on morals was *Seneca*, born i year of the Christian era. Gifted by nature w lent talents, he devoted himself to the cultivat Stoic philosophy, and his various learning and wisdom procured him the office of tutor to N afterwards incurred the enmity of that m cruelty, and was condemned by him to death. with the calmness of a virtuous mind (A. D. 6

It is perhaps unnecessary to mention, tha the works of the writers whose names have bec nor of others of less importance, were circula rally among the Roman people. Being writte of parchment or papyrus, copies were multi by great labour and expense, and sold or exclusively to persons of taste and opulenc the great mass of Roman citizens and p were left in entire ignorance of books, or of jects of which they treated. In the Roma Pompeii, lately uncovered from the effects of a eruption of Vesuvius, many interesting rema have been discovered, but no traces of literat soever. Being excluded from the pleasures a tages of mental culture through the agency the only recreations of the people consisted in l games, witnessing fights of gladiators or s with each other, or with wild beasts, or attenc tacles probably less barbarous, but not more to cultivate the national intellect, or produce finement. In these facts, we find the true ca decline of both Greek and Roman civilisation a civilisation only of castes and classes. T nothing expansive or vivifying in it. Suddenly up in the Grecian republics, and was transp Rome; but there, after a short struggle, it w out and destroyed. The modern civilisation t out of the chaos that followed the demise of th power, is an entirely different thing, because more pervades all classes of society, and by the expansive principle of education, aided b of printing, promises to extend and increase throughout every succeeding generation, ti mately fulfil the highest conditions of impro which the human race is susceptible.

EMPIRE TO THE END OF THE ELEVENTH CENTURY.

ther sheet (ANCIENT HISTORY OF GREECE AND
the decline of the Roman empire has been
ll the period (321) when Constantine trans-
e imperial abode to Byzantium (a city situ-
the west shore of the Black Sea, and after-
lled Constantinople, in honour of its second
. In his endeavours to make this city the
overnment, he only partially succeeded; for it
r happened after his day that there was one
in the east and another in the west, and not
nly two or three different individuals in the
s, at the head of considerable military forces,
partial and even universal empire. Rome
l the countries of western Europe were soon
e characteristics and individuality of empire;
tantinople continued for a thousand years the
men who had still the name of emperors, and
themselves the descendants of the Cæsars,
they had long ceased to wield any thing but
w of power. Constantine was himself instru-
l dismembering his empire, having before his
ided it among no fewer than five individuals,
his three sons, Constantine, Constans, and
ius, and two nephews named Dalmatius and Annibalianus, both of whom bore in addition the surname of Cæsar, still popular among a people who wished themselves to be considered Roman.

Constantine II. soon fell a sacrifice to the cruelty and ambition of his brother Constans, who, in his turn, lost his life in attempting to quell a revolt among his subjects; and Constantius, the youngest of the sons, having found means to destroy the two Cæsars, and five other cousins, and two uncles, found himself, at an early period of life, the undisputed master of the empire. He reigned twenty-four years, but left no monuments of goodness or of greatness, having wasted his time in the practice of vice, or in the equally unprofitable, if more innocent, employment of disputing with bishops on the abstrusest points of doctrinal theology, while a host of enemies, apparently from every side of his dominions, were engaged in undermining and laying waste the empire. It was in the west that these attacks were first made, though, perhaps, it was in the east that they were fiercest. Numberless and powerful barbarians now began to pour unceasingly upon Gaul, Spain, and latterly upon Italy itself, from the forests of the north, and in particular from those of Germany —a country whose inhabitants have been remarkable in the history of the world, both as having originated many of the greatest movements in society, and as having laid open more of the sources of human thought than any other people that could be named. The Franks, Saxons, Goths, and Alemanni, devastated the fine countries watered by the Rhine, and so effectually parted them from the empire, that from this period their history becomes wholly separate. At the same time the Sarmatians, Persians, Scythians, and others, made dreadful incursions on the east. All that Constantius did to stem this powerful tide, was to raise his kinsman Julian, whom he surnamed Cæsar, to command in the army.

Julian had been early instructed in the Christian religion, but he is not known to have ever given it any credit, although he has been often called apostate. He had imbibed the philosophy of Plato in the schools of Athens; and with this learning, with the elements of a great character in his mind, and with the models of Cæsar, of Trajan, and of Marcus Antoninus in his eye, he formed the design, and seemed to have the ability, to raise up and consolidate the glories of the falling empire. His victories over the Alemanni in Gaul, although they preserved the empire, excited only the envy of the emperor, and Constantius was about to depose him from his command, when his own death saved him from the ignominy to which the soldiery would certainly have subjected him for any attempt to degrade their favourite commander. Julian was himself declared emperor by the army, and the people had lost both the power and the will to resist. Unfortunately for his fame, Julian perished in battle with the Persians, only three years after his accession. In that

ment by committing suicide. This event caused the abolition of the decemvirate, after it had lasted only three years. The consuls and tribunes were then restored.

The violent struggles of the patricians and plebeians did not prevent Rome from gradually acquiring an ascendancy among the Italian states. The armies of Rome, unlike all others in those early times, were standing armies: the soldiers had regular pay, and made arms a profession. Their compact and well-organised force, meeting in general only ill-disciplined militia, carried every thing before it.* Veii, a state which had long defied and rivalled them, fell before their general Camillus (396 B.C.) In 385 B.C., they finally reduced the Gauls, a powerful branch of the Celtic race inhabiting the north of Italy. They then fought and subdued the Samnites. Other states fell beneath their powerful arms, and in the year 274 B.C., they had acquired the complete mastery of all Italy.

Wars with Carthage.

A splendid victory which they had gained near the close of the Italian wars over Pyrrhus, king of Epirus, who had come to aid the Samnites, led the Romans to believe that they might extend their conquests to countries beyond Italy. Sicily, originally a Greek colony, was at this time important for the great quantities of grain produced in it. The Carthaginians, an enterprising commercial people, occupying a tract of country in the north of Africa, were anxious to obtain possession of this island; but the Romans were inclined to dispute the prize. They fitted out a fleet, the first they ever had, and sent a large force to aid the Sicilians, who were friendly to them, in expelling the Carthaginians. Agrigentum, a great city in Sicily, was taken, after a long siege, by the joint forces of Rome and Syracuse; and the Roman fleet gained a complete victory over that of Carthage (260 B.C.) These successes were followed by the reduction of Corsica and Sardinia. The Roman fleet then sailed against Carthage itself: the Carthaginians were at first about to submit, but, inspirited by a timely aid from Greece, they made a strong effort to repel the Roman army, in which they were successful, at the same time taking Regulus, the Roman commander, a prisoner. Some time afterwards, when repeated defeats in Sicily made them desirous of peace, they allowed Regulus to go to Rome to help in negotiating it, under a solemn promise to return if the treaty should fail. It was rejected, at the urgent desire of Regulus himself, as discreditable to Rome, and he then deliberately returned to surrender his life to the enraged Carthaginians. After some further successes on the part of the Romans, the Carthaginians submitted to a humiliating peace (241 B.C.), surrendering Sicily, and agreeing to pay a large sum of money. Sicily, excepting the kingdom of Syracuse, now became a province of Rome, being the first out of Its acquired.

Twenty-three years of peace recruited Carthage, and enabled her to renew ho Rome. Under the celebrated Hannibal, proceeded through Spain and Gaul, cros and descended on the plains of Italy. The four battles in succession, the last being th in which 40,000 of their soldiers, and near of their knights (or soldiers of the patricia said to have fallen. If Hannibal had insta to Rome, it is believed that he would hav session of it, and probably given a new world's history. He deliberated, and the time to concentrate all their remaining str him. Under their general, Fabius, the policy which has since become proverb battle, and exhausting the enemy's stren The war ended (202 B.C.) by their gaini reducing Spain, and taking from Carthage h her fleet, and a vast sum of money.

A third war with Carthage, springing ex the ambition of the Roman people, began 149 B.C., and ended, three years after, in destruction of that city and people. Car thoroughly destroyed, that its very site is of uncertainty. In consequence of this suc part of northern Africa became tributary

Some years before, the Romans had arms into Greece and Asia Minor. Mace kings had not long before conquered Persi Egypt, became tributary to Rome, and became one of her provinces. The same y the Romans destroyed Carthage, saw Gree to them. Thus, in less than a century, t quered the greater number of the countries their own comparatively small state.

Insurrection of the Gracchi.

These triumphs were not an unmixed people were intoxicated with success. arising from spoil, but accumulated chiefly of the nobility, led to great luxury, and f means of corrupting the people. The overg and power of the senators produced great at the same time that it made the citizens this time (130 B.C.) arose Tiberius and Cai two noble youths, whose zeal to reform corruptions of the state precipitated them a measures destructive of all government and Tiberius, the elder brother, urged the peop by force, the revival of an ancient law, l perty in land, and thus abridging the ex patricians. A tumult was the consequen Tiberius and 300 of his friends were k Forum. Caius Gracchus then took up the people, and, notwithstanding every opp enabled to abridge the power of the senate the people from monopolists in corn, and rights of Roman citizenship. Employin brother, the dangerous engine of tumultua fell a victim to it himself, with 3000 of hi who were slaughtered in the streets of I tumults attending the sedition of the Grac prelude to those civil disorders which now quick succession to the end of the common

* A Roman army, in its perfect state, included infantry and cavalry. The heavy-armed infantry, which was its principal strength, was divided into ten cohorts and fifty-five companies, under the orders of a corresponding number of tribunes and centurions. The first cohort, which always claimed the post of honour and the custody of the eagle, was formed of 1105 soldiers, the most approved for valour and fidelity. The remaining nine cohorts consisted each of 555; and the whole body of the legion amounted to 6100 men. Their arms were uniform, and admirably adapted to the nature of their service: an open helmet, with a lofty crest; a breast plate, or coat of mail; greaves on their legs; and an ample buckler on their left arm. Besides a lighter spear, the legionary soldier grasped in his right hand a formidable javelin, which he threw at his foe at the distance of ten or twelve paces. As soon as it was darted, he drew his sword, and rushed forwards to close with the enemy. His sword was a short well-tempered blade, that carried a double edge, and was alike suited to the purpose of striking or pushing. It was by this short sword, which was little more than double the length of our modern table-

MA.—MAHOMET.—EMPIRE OF THE SARACENS.

not before the sixth century that Arabia be-
eculiarly remarkable in the history of the world.
l Arabs, as they have been generally called, had
ignalised themselves by incursions on the em-
e east, when Mahomet was born, in the year 569
y, 571) of the Christian era, at Mecca, the prin-
y of their country. He is said to have been de-
from some great families; but it is certain that
ediate progenitors were poor, and he had little
n but what his own means and his own mind
re him. Yet this man became the founder of
empire, and the fabricator of a religion which
inued to our own day to affect greater numbers
nd than Christianity itself. At an early period
e are told, "he retired to the desert, and pre-
o hold conferences with the Angel Gabriel, who
d to him, from time to time, portions of a sacred
Koran, containing revelations of the will of the
e Being, and of the doctrines which he required
het (that is, Mahomet himself) to communicate
orld." The Mahometan religion, as the so-
evelations of this great impostor have since been
ed, was a strange mixture of the superstitions of
the morality of Christ, and the rites of Judaism.
o this happy mixture of tenets, usages, and tra-
already existing among his countrymen, and to
liability of the precepts of the Koran to all
nnections and all the business of life, that Ma-
ems to have owed his extraordinary success.
indeed, have attributed this to certain indul-
allowed in the Koran; but in reality these in-
es existed before, and the book breathes upon
le an austere spirit. This extraordinary work
inculcated elevated notions of the divine nature and of moral duties; it taught that God's will and power were constantly exerted towards the happiness of his creatures, and that the duty of man was to love his neighbours, assist the poor, protect the injured, to be humane to inferior animals, and to pray seven times a-day. It taught that, to revive the impression of those laws which God had engraven originally in the hearts of men, He had sent his prophets upon earth—Abraham, Moses, Jesus Christ, and Mahomet—the last, the greatest, to whom all the world should owe its conversion to the true religion. By producing the Koran in detached parcels, Mahomet had it in his power to solve all objections by new revelations. It was only after he was well advanced in years that his doctrines began to be received. At first, indeed, they were so violently opposed by his fellow-citizens of Mecca, that the prophet was obliged to fly from the city to save his life. This event is called by his followers *Hegyra*, or the Flight: it occurred in the 622d year of the Christian era; and they reckon dates from it as we do from the birth of Christ. Mahomet took refuge in the city of Medina, and by the aid of his disciples there, he was soon enabled to return to Mecca at the head of an armed force. This enabled him to subdue those who would not be convinced, and henceforward he proceeded to make proselytes and subjects together, till at length, being master of all Arabia and of Syria, his numerous followers saluted him king. (627.) This extraordinary man died suddenly and in the midst of successes, at the age of sixty-one (632). Abubeker, his father-in-law and successor, united and published the books of the Koran, and continued and extended the empire, spiritual and temporal, which Mahomet had left him.

A more powerful caliph (such was the title given to this series of monarchs) was Omar, the successor of Abubeker (635). Barbarity, ferocity, and superstition seem to have been mingled and to have reached their height in the person of Omar. It was by his order that the most magnificent library of antiquity, that of Alexandria, consisting of 700,000 volumes, was burned to ashes. The reason which he gave for this act is worth preserving: "If these writings," he said, "agree with the Koran, they are useless, and need not be preserved; if they disagree, they are pernicious, and ought to be destroyed." By himself and his generals, this ferocious conqueror added Syria, Phœnicia, Mesopotamia, Chaldea, Egypt, Lybia, and Numidia, to his empire. Next came Otman, and then Ali, the son-in-law of Mahomet himself. The name of Ali is still revered by Mussulmans. His reign was short but glorious. "After some internal troubles, the Saracens won their way along the coast of Africa, as far as the pillars of Hercules, and a third province was irretrievably torn from the Greek empire. These western conquests introduced them to fresh enemies, and ushered in more splendid successes. Encouraged by the disunion of the Visigoths [in Spain], and invited by treachery, Muza, the general of a master who sat beyond the opposite extremity of the Mediterranean Sea, passed over into Spain, and within about two years the name of Mahomet was invoked under the Pyreneans."—(*Hallam*. 710.)

Nineteen caliphs of the race of Omar succeeded Ali, and after these came the dynasty of the Abassydæ, descended by the male line from Mahomet. The second caliph of this race, named Almanzor, removed the seat of empire to Bagdat (762), and introduced learning and the culture of the sciences, which his successors continued to promote with zeal and liberality. This was some recompense for those indignities which had been cast upon literature by the brutal Omar. Perhaps the obligations of modern Europe to Arabia at this time have been overstated; but it is not to be denied that learning, almost totally excluded and extinct in Europe during the eighth and ninth centuries, found an asylum here. It has been matter of dispute how the tastes of these fierce Arabians became thus first directed. They probably owed it to the Greeks; but it is certain that what they got they returned with interest. We are

yielded to the effort of fifteen centuries. They united the subjects of the most distant provinces by an easy and familiar intercourse; but their primary object had been to facilitate the marches of the legions: nor was any country considered as completely subdued, till it had been rendered, in all its parts, pervious to the arms of the conqueror. The advantage of receiving the earliest intelligence, and of conveying their orders with celerity, induced the emperors to establish, throughout their extensive dominions, the regular institution of posts. Houses were every where erected at the distance of only five or six miles; each of them was constantly provided with forty horses, and, by the help of these relays, it was easy to travel 100 miles in a day along the Roman roads." By these means the Romans maintained their ascendancy in every country, and diffused through the whole empire the improvements of social life. There was thus a nobleness and grandeur in various circumstances connected with the Roman sway, which by a moderate, firm, and enlightened system of government, might have ultimately proved of the greatest importance in the social advancement of mankind. It was most unfortunate, however, both for this sacred cause and for the welfare of the Roman people themselves, that the plan of enriching the commonwealth at the seat of power, consisted almost exclusively in robbing foreign territories—a plan which it is impossible ever can permanently exist in any country, whatever be its power. Besides, with all the encouragement given to the fine arts, such as architecture, sculpture, and the production of luxuries, there was no substantial industry or commerce, and no means were taken to enlighten and refine the community, by science, literature, or morals. The whole fabric of Roman greatness, in fact, rested on no sure foundation, and its gradual decline and fall, from the extinction of the republic, cannot excite the smallest degree of surprise.

The Twelve Cæsars.

The successes of Cæsar placed him at the head of the Roman world. His only remaining opponent was Cato, who has been described as one of the most faultless characters in Roman history. This eminent patriot was, however, unable, by force of arms, to restore the liberties of the people, or to arrest Cæsar in his victorious and ambitious career. Being at last deserted by his friends, and dreading to fall into the hands of his enemy, after pondering a while on the nature of the immortality of the soul, he stabbed himself with his own sword—an act which Roman morality held as perfectly justifiable, and which was committed by many of the first characters of the state, when they happened to be deserted by fortune. After the death of Cato, Cæsar was without a rival. Returning to Rome in triumph, he established his power as dictator, and shortly afterwards received the title of *imperator*, or emperor, with full powers of sovereignty. The assumption of these dignities, as may be supposed, served to unite the friends of the republican form of government, or at least all who had thriven on the diseases of the state, with the view of making away with the usurper. A deep-laid conspiracy was accordingly formed against Cæsar, composed of sixty senators, at the head of whom was Decimus Brutus, whose life Cæsar had spared after the battle of Pharsalia, and Cassius, who was pardoned soon after. Cæsar was privately made acquainted with the existence of plots against his life; but, being of a fearless disposition, he proceeded, on the day intended for the fatal blow, to the senate-house. Here, by a preconcerted signal, he was stabbed behind in the shoulder by Casca. All the conspirators now rushed forward, and he received a second stab in the breast, while Cassius wounded him in the face. In this emergency, he defended himself with great vigour, rushing among them, and throwing down such as opposed him, till he saw Brutus among the *conspirators*, who, coming up, struck his dagger into *his thigh. From that moment*, Cæsar thought no more *of defending himself*, but, looking upon the ungrateful assailant, cried out, "And you too, my son!" Then, covering his head, and spreading his robe before him, in order to fall with a greater decency, he sunk down at the base of Pompey's statue, and received twenty-three wounds from hands which, he supposed he had disarmed by his benefits. Thus died a remarkable man, the best who ever aspired to sovereignty in Rome, the victor in five hundred battles, and the conqueror of a thousand cities, in the sixth year of his age (44 B.C.)

Upon the death of Cæsar, the conspirators were unable to form a government, or to insp[ire] in their designs; and in the distractions that ensued Mark Antony, an ambitious man and fo[rmer] lieutenant of Cæsar, endeavoured to raise himself to supreme command. In this effort he was successful. Octavius, grand-nephew and adopted son of Cæsar, also came forward as a candidate for power, likewise did a third personage, named Lepidus. One of these ambitious men possessed the talents to attain supreme command, they entered into a combination, forming a tripartite power, termed a triumvirate. Being opposed by Brutus, a dreadful civil war ensued, the atrocities of which are scarcely paralleled in history. Brutus was ultimately killed, after which the three triumvirate quarrelled among themselves, and each, by force of arms, becoming conqueror, assumed the dignity of emperor of Rome.

Julius Cæsar's successors.

On arriving at this proud eminence, Octavius, called Augustus Cæsar,* relinquished the ambitious designs of his predecessors; he endeavoured to consolidate the empire, instead of extending its bounds, and introduced a spirit of moderation in the public councils hitherto unknown. Suiting the taste of the Romans, he indulged them in the pleasure of seeing the appearance of a republic, while he made them really happy in the effects of a monarchy, guided by the most consummate prudence. Historians delight in recounting the noble deeds of Augustus, and the glories of his reign, from him the phrase of "the Augustan age" is used by writers to periods in the history of nations remarkable for the prosperity and refinement which has been derived. It was in the twenty-second year of the reign of this magnanimous prince that Jesus Christ was born, in the Roman province of Judea, in the year 14 of our era, Augustus was succeeded by Tiberius, a person of an entirely different character, under whom the corruptions of the state became so great that the nineteenth year of his cruel reign, Christ was crucified, under Pontius Pilate, the Roman governor of Jerusalem. In the year 37, Tiberius was murdered by smothering him with pillows, or, as some writers allege, by poison; and he was succeeded by Caligula, a person of vicious habits and still more cruel disposition. This emperor was prodigal and extravagant to a degree almost inconceivable. The luxuries of former emperors were simplicity itself when compared to those which he practised. He contrived new ways of bathing with the richest oils and most precious perfumes, and that with the utmost profusion. He found pearls of immense value, and had even jewels, of the most dissolved among his sauces. He sometimes served up dishes of pure gold presented before his guests as delicacies of meat. But his prodigality was the most remarkable in regard to his horse. He built for him a stable of marble, and a manger of ivory. When the favourite animal, which he called Incitatus, was to sleep, sentinels near its stable the night previous were to prevent its slumbers from being broken. He presented it a house, furniture, and a kitchen, in which all its visitors with proper respect.

* A number of the imperial successors of Julius Cæsar assumed the title of *Cæsar*, in addition to their other designations, in the same manner as we find the appellations of Pharaoh and Ptolemy were assumed by many of the Egyptian sovereigns. The name of Cæsar has been curiously enough preserved until the present day in the title of Czar, which is given by the Russians to their emperor.

d in time into utter insignificance, while the wer was wielded by an important officer, called or of the Palace. Among the most remarkable was Pepin Heristal, Duke of Austrasia, who rance for thirty years with great wisdom and licy. s during this period that the Saxon Heptarchy rmed in Britain.

CHARLEMAGNE—THE NEW WESTERN EMPIRE.

ar the greatest character who appeared in Europe period was Charles, the son of Pepin le Bref, own in history by the name of Charlemagne, or the Great. "In the course of a reign of forty- ars, Charlemagne extended the limits of his em- yond the Danube, subdued Dacia, Dalmatia, and conquered and subjected all the barbarous to the banks of the Vistula, made himself master eat portion of Italy, and successfully encountered ns of the Saracens, the Huns, the Bulgarians, he Saxons. His war with the Saxons was of years' duration; and their final conquest was not ed without an inhuman waste of blood. At the st of the pope, and to discharge the obligations father Pepin to the holy see, Charlemagne, h allied by marriage to Desiderius, King of the rds, dispossessed that prince of all his dominions, nt a final period to the Lombard dominion in (774)."—(*Tytler.*)

m Charlemagne made his first entry into Rome, he was crowned King of France and of the Lombards by Pope Adrian I.; and afterwards, on a second visit, he was consecrated Emperor of the West by the hands of Pope Leo III. (800). He probably attached some importance to these rites; but it is to be remarked that, as yet, the pontiff was not in enjoyment of that high influence by which he afterwards could confer or withdraw sovereignty at his pleasure.

"It is probable," says Mr Tytler, "that, had Charlemagne chosen Rome for his residence and seat of government, and at his death transmitted to his successor an undivided dominion, that great but fallen empire might have once more been restored to lustre and respect; but Charlemagne had no fixed capital, and he divided even in his lifetime his dominions among his children" (806). Charlemagne died in the year 814, aged 72. His last days were employed in consolidating, rather than extending, his empire, by the making of laws which have rendered his name famous, and his memory even blessed. "Though engaged in so many wars," says Dr Russell, "Charlemagne was far from neglecting the arts of peace, the happiness of his subjects, or the cultivation of his own mind. Government, manners, religion, and letters, were his constant pursuits. He frequently convened the national assemblies, for regulating the affairs both of church and state. In these assemblies he proposed such laws as he considered to be of public benefit, and allowed the same liberty to others; but of this liberty, indeed, it would have been difficult to deprive the French nobles, who had been accustomed, from the foundation of the monarchy, to share the legislation with their sovereign. His attention extended even to the most distant corners of his empire, and to all ranks of men. He manifested a particular regard for the common people, and studied their ease and advantage. The same love of mankind led him to repair and form public roads; to build bridges, where necessary; to make rivers navigable for the purposes of commerce; and to project that grand canal which would have opened a communication between the German Ocean and the Black Sea, by uniting the Danube and the Rhine." Amidst all his greatness, his personal habits were simple; his dress was of the plainest sort, and such even as to shame his own courtiers; his hours of study were set apart, and seldom omitted even in the busiest times of his life; his daughters were taught spinning and housewifery, and his sons trained by himself in all the accomplishments of the age. Charlemagne was fond of the company of learned men, and greatly encouraged their residence in his dominions. In this respect he resembled his contemporary Haroun al Raschid, so famous in Arabian history, and Alfred the Great, who appeared in England shortly after this period. Superior to all national prejudice, he elevated an Englishman named Alcuin to the head of his royal academy. He was zealous for the extension of Christianity; and one of the few blots upon his name arises from his having, in the spirit of his age, caused 4000 Saxon prisoners to be beheaded in one day, because they would not submit to be baptised. Charlemagne established schools in the cathedrals and principal abbeys, for teaching writing, arithmetic, grammar, and music.

Of the sons of Charlemagne, Louis, the youngest, surnamed the *Debonnaire*, or gentle, was the only one who survived. He succeeded to all his father's dominions, except Italy, which fell into the hands of Bernard, a grandson of Charlemagne. Louis, deficient in vigour of character, was not able to hold together the great empire left to him by his father. Having, among the first acts of his reign, given large portions of it to his children, the remainder of his life was spent in disgraceful quarrels with them; and, after his death (840), the empire was formally divided—Lothaire, his eldest son, obtaining Lorraine and Provence; while Charles the Bald, a younger son, continued sovereign of the western parts of France; and Louis became King of Germany. Thus abruptly ends the history of the second western empire.

FRANCE FROM THE TIME OF CHARLES THE BALD TO THE ELEVENTH CENTURY.

During the reign of Charles the Bald, France first suffered from the attacks of the Normans, a race of bold and needy adventurers from the north of Europe. Their plundering invasions were continued for upwards of seventy years; till at length (912) the French king was compelled to purchase their amity, by yielding to Rollo, their leader, the country afterwards from them called Normandy, of which Rouen was the capital. The first successor of Charles the Bald, with whose name history has associated any thing worth remembering, was Charles, surnamed the Fat (885). He was the son of that Louis to whom Germany had been before assigned, and was thus enabled to bring that country and France for a short time once more under a single ruler. In the turbulence of the times, Charles was soon deposed, and during the century which followed, France, so lately the centre of an empire little less than that of Rome in the days of its Cæsars, was split up into a multitude of independencies, by nobles who would own only a very slender subjection to the kings. Out of these nobles at last sprang Hugh Capet (987), who was enabled, on the death of Louis V., to place himself on the throne. He was already possessed of great property, and proved himself to be also a prince of much ability and penetration. He established the royal residence at Paris, which his predecessors had deserted, and became the founder of a family which still, in one of its branches, occupies the throne of France. He deserves to be mentioned with honour, as being among the first of European kings who trusted to prudence, counsel, and moderation, rather than force of arms, in effecting his purposes. His success was great, as it deserved to be. On his death (996), in the fifty-seventh year of his age and the tenth of his reign, he was succeeded by his son Robert, who had all his father's equitable disposition without his vigour of character. He was subjected to a degree of tyranny, on the part of the church, of which perhaps the history of the world does not afford such another example. Robert had been guilty of marrying a cousin in the fourth degree, without a *dispensation* from the holy see, that is, without paying a fine for what was only an imaginary offence. Gregory V., who then occupied the pontifical chair, threatened to excommunicate Robert if he should not dismiss his wife, and, on Robert's refusal, actually did so, and laid all his dominions under an interdict. This punishment proved tremendous in its effects; for, though the king himself showed sense and courage enough to despise the wrath of the pontiff, yet his subjects deserted him in terror. The priests, in consequence of the interdict, refused sacrament to the sick all over the country, and the dead were every where left unburied, when mass was no longer said. In these circumstances, the unfortunate king submitted. A second marriage, contracted with the consent of the church, proved very unhappy. The new queen, Constantia, or Constance, made many efforts to embroil her husband and his family, and in the midst of these Robert died (1031). His son Henry succeeded, and it was during his reign that those pilgrimages to the Holy Land, which were so soon to end in the Crusades, took their rise. Of these we shall speak by themselves. In the mean time we take leave of France by mentioning that Henry's successor was Philip (1060), whose reign is remarkable as having witnessed the beginning of those contests with England which continued at intervals till the early part of the nineteenth century.

At this period (1066), the Normans conquered England, where their leader, William Duke of Normandy, became the founder of an important dynasty.

THE GERMAN EMPIRE TILL THE ELEVENTH CENTURY.

Germany had no political existence till the time of Charlemagne, when it was formed by him into a part of the western empire. Towards the conclusion of the ninth century, it became an empire of itself. In the year 887, Arnold, a natural son of Carloma phew of Charles the Fat, was declared emp assembly of bishops and nobles. These ass Germany always retained a voice in the their emperors; and though they often n choice from the line of succession, they neve ledged any hereditary rights whatever. Afte of Arnold's son, called Louis III., their choic Conrad, Duke of Franconia (912). Conrad's was Henry I., surnamed the *Fowler*. He was great abilities, and introduced order and go ment into the empire. "He united the gra curbed their usurpations; built, embellished, fied cities; and enforced, with great rigour, tion of the laws in the repression of all enorn had been consecrated by his own bishops, and no correspondence with the see of Rome. Otho the Great, who succeeded him (938), u to the empire, and kept the popedom in con jection. He made Denmark tributary to th crown, annexed the crown of Bohemia to h minions, and seemed to aim at a paramount over all the sovereigns of Europe."

In these times the papacy was much d "Formosus, twice excommunicated by Pope J had himself arrived at the triple crown. On his rival, Pope Stephen VII., caused his body out of the grave, and after trial for his cr demned it to be flung into the Tiber. The Formosus fished up the corpse, and had inter cure the deposition of Stephen, who was st prison. A succeeding pope, Sergius III., ag the ill-fated carcass, and once more threw river. Two infamous women, Marosia and managed the popedom for many years, and chair of St Peter with their own gallants adulterous offspring."—(*Tytler*). It was amids fusion and these disturbances that Otho was turn his arms on Italy. He shortly made hims of it all, and had himself declared emperor b see, with all the pomp that had attended ceremony to Charlemagne himself (962). XII., whom Otho himself had been the mea ing to the pontifical chair, rebelled soon af returned to Rome in fury, had John depose one-half of the senate before he left the city, a a solemn acknowledgment from an assembly tant bishops, that the emperor had a right nominate to vacant bishopries, but also to pope himself. Otho died (972), and was f succession by Otho II., Otho III., St Henry, C and Henry III., the history of whose reign nothing instructive, or upon which the mind with pleasure. Henry IV. (1056) is rema having been one of the greatest victims of pap that history has made us acquainted with. brated Hildebrande, known as Gregory VI this age the means of raising the power of t to a height which it had never reached before Henry's contest with this daring and ambitio he made him twice his prisoner, and twic thunders of the Vatican excommunicate and d in consequence. As a specimen of the p insolence of this pope, we may mention th dispirited by the effect which his excommunic upon his friends and followers, having resol to Rome and ask absolution from Gregory i did so; and, presenting himself as an humbl at the palace of St Peter, was there stripped of and obliged to remain in that condition, in court, in the month of January (1077), b among snow, and fasting, for three succes before he was allowed to implore forgivene offences! On the fourth day he was permitt the toe of his holiness, and then received a Henry died in the year 1106.

ITALY FROM THE NINTH TO THE ELEVENTH CE

The state of Italy during this period has be

noticed in the preceding section. From the Lothaire, to whom it was nominally assigned as te kingdom (843), to that of Otho the Great, ne country was ravaged by contending tyrants. the invasions of the Normans and the claims ierman emperors, it became much distracted, ultimately split up into several independent Some of these, particularly Venice, Genoa, d Florence, became afterwards independent and l republics. It was during the present period foundation of the temporal power of the popes

N FROM THE TIME OF ABDALRAHMAN TILL THE ELEVENTH CENTURY.

ng the period of which we have been treating, eemed less a part of Europe than any other in it. The greater part of it still continued he dominion of the Moors, and apparently with ge. "This period," says Mr Tytler, "from the of the eighth to the middle of the tenth century, nt brilliant era of Arabian magnificence. Whilst al Raschid made Bagdat illustrious by the splen- f the arts and sciences, the Moors of Cordova th their brethren of Asia in the same honourable s, and were undoubtedly at this period the most ned of the states in Europe. Under a series of inces, they gained the highest reputation, both and arms, of all the nations of the west." And se eastern conquerors seem to have had their s as well as others. A race of powerful nobles them, as in the other countries of Europe, dis- the country and made effective government ble. The Christian part of the population, still ed of several provinces in the north, might have dvantage of such a state of things for repossess- mselves of their lost country. But civil dissen- s still greater among themselves, and Christian readily formed alliances with the Moors, if they rospect of weakening an immediate enemy by ans, forgetting that the common foe still re- to harass them. But the detail of these nume- d petty contentions need not detain us longer; s the history of Spain assume any importance rds the conclusion of the fifteenth century, when ed arms of Ferdinand and Isabella expelled the or ever from the country.

AL STATE OF EUROPE IN THE ELEVENTH CENTURY.

e the end of the tenth century, Europe had a point of darkness and degradation, beyond seemed impossible to go. Though long nomi- nverted to the Christian religion, the nations pe may be said to have scarcely exhibited, up period, a single distinctive mark of what men nd by Christian civilisation. "The barbarous " says Dr Robertson, "when converted to nity, changed the object not the spirit of their worship. They endeavoured to conciliate the f the true God, by means not unlike to those hey had employed in order to appease their ities. Instead of aspiring to sanctity and vir- ich alone can render men acceptable to the thor of order and of excellence, they imagined y satisfied every obligation of duty by a scru- bservance of external ceremonies. Religion, g to their conception of it, comprehended no- se; and the rites by which they persuaded es that they should gain the favour of Heaven, such a nature as might have been expected rude ideas of the ages which devised and in- l them. They were either so unmeaning as to ether unworthy of the Being to whose honour re consecrated, or so absurd as to be a disgrace n and humanity. Charlemagne in France, and he Great in England, endeavoured to dispel knese, and gave their subjects a short glimpse and knowledge. But the ignorance of the age powerful for their efforts and institutions. The darkness returned, and settled over Europe, more thick and heavy than before." The clergy were the only body of men among whom any knowledge or learning now remained; and this superiority they employed to continue, if not to deepen, the degradation into which society had fallen. The superstitious belief that moral crimes could be expiated by presents to the Deity, if not originated by them, at least found them its strenuous defenders, for the reason that a gift to God meant, in plainer language, a *solatium* to the church. The priests would have made men believe that avarice was the first attribute of the Deity, and that the saints made a traffic of their influence with Heaven. Hence Clovis is said to have jocularly remarked, that, "though St Martin served his friends very well, he also made them pay well for his trouble."

Persons in the highest ranks and most exalted stations, could neither read nor write. Of the clergy themselves, many of them did not understand the Breviary which it was their duty to recite; and some of them, it is said, could scarcely read it. Those among the laity who had to express their assent in writing, did so by a sign of the cross attached to the document (sometimes also by a seal); and to this day, in consequence, we speak of *signing* a document, when we subscribe our names.

The evils of the feudal system, too, had by this time become excessive and insupportable. Every petty chief was a king in his own dominions, and their vassals were their subjects, if, indeed, they should not be called slaves. These barons made laws of their own, held courts of their own, coined money in their own names, and levied war at their own pleasure against their enemies; and these enemies were not unfrequently their kings. Indeed, the kings of these times can be looked upon in no other light than as superior lords, receiving a nominal and empty homage for lands, which, in the fictitious language of feudal law, were said to be held of the crown. In these circumstances, what might we expect to be the condition of the great body of the people? They were either actual slaves, or exposed to so many miseries, arising from pillage and oppression, that many of them made a voluntary surrender of their liberty in exchange for bread and protection from the feudal lords. There *was* no people, as that term is now understood. "There was nothing morally in common," says Guizot, "between the lord and the serfs; they formed part of his domains, and were his property; under which designation were comprised all the rights that we at present call rights of public sovereignty, as well as the privileges of private property, he having the right of giving laws, of imposing taxes, and of inflicting punishment, as well as that of disposing and selling. In fact, as between the lord and the labourers on his domain, there were no recognised laws, no guarantees, no society, at least so far as may be predicated of any state in which men are brought into contact." In what way society rose above so many accumulated evils, and light sprang from so much darkness, we shall now endeavour to show. The most remarkable and the most lasting influence, beyond all question, was that exerted by

THE CRUSADES.

"It is natural to the human mind," says Dr Robertson, "to view those places which have been distinguished by being the residence of any celebrated personage, or the scene of any great transaction, with some degree of delight and veneration. To this principle must be ascribed the superstitious devotion with which Christians, from the earliest ages of the church, were accustomed to visit that country which the Almighty had selected as the inheritance of his favourite people, and in which the Son of God had accomplished the redemption of mankind. As this distant pilgrimage could not be performed without considerable expense, fatigue, and danger, it appeared the more meritorious, and came to be considered as an expiation for almost every crime. An opinion, which spread with rapidity over Europe

about the close of the tenth and beginning of the eleventh century, and which gained universal credit, wonderfully augmented the number of credulous pilgrims, and increased the ardour with which they undertook this useless voyage. The thousand years mentioned by St John [Rev. xx. 2, 3, 4] were supposed to be accomplished, and the end of the world to be at hand. A general consternation seized mankind; many relinquished their possessions, and, abandoning their friends and families, hurried with precipitation to the Holy Land, where they imagined that Christ would quickly appear to judge the world.*

While Palestine continued subject to the caliphs, they had encouraged the resort of pilgrims to Jerusalem, and considered this as a beneficial species of commerce, which brought into their dominions gold and silver, and carried nothing out of them but relics and consecrated trinkets. But, the Turks having conquered Syria about the middle of the eleventh century, pilgrims were exposed to outrages of every kind from these fierce barbarians. This change happening precisely at the juncture when the panic terror which I have mentioned rendered pilgrimages most frequent, filled Europe with alarm and indignation. Every person who returned from Palestine related the dangers which he had encountered, in visiting the holy city, and described with exaggeration the cruelty and vexations of the Turks."

Among the most notorious of those who had returned with these accounts, was a monk known by the name of Peter the Hermit. By all accounts this individual seems to have been a weak-minded and contemptible being. He is represented as running from city to city, and from kingdom to kingdom, bare-headed, with naked arms and legs, and bearing aloft a ponderous crucifix in his hand, imploring and preaching with an enthusiastic madness on the necessity of wresting the Holy Land from the hands of the infidels. In a more enlightened age, Peter the Hermit would probably have been confined as a troublesome lunatic; in this, however, he was not only allowed to go on, but encouraged and abetted in his career. The ambitious Hildebrande had expressed a strong desire to send armed forces from Europe to exterminate the Mahometans from Palestine, in order that another country might be brought under his spiritual subjection; and Urban II., who at this time occupied the chair of St Peter, warmly seconded the efforts of the enthusiastic monk. Nor was Peter's success small. Vast multitudes proclaimed themselves ready to engage in the undertaking. Two great councils of the church, one of them held at Placentia and the other at Clermont, in Auvergne, attended by prelates, princes, and immense multitudes of the common people, declared enthusiastically for the war (1095). The pope himself attended at the last, and Peter and he having both addressed the multitude, they all exclaimed, as if impelled by an immediate inspiration, "It is the will of God! it is the will of God!" These words were thought so remarkable, that they were afterwards employed as the motto on the sacred standard, and came to be looked upon as the signal of battle and of rendezvous in all the future exploits of the champions of the cross. Persons of all ranks now flew to arms with the utmost ardour. The remission of penance, the dispensation from those practices which superstition imposed or suspended at pleasure, the absolution of all sins, and the assurance of eternal felicity, were the rewards held out by the church to all who joined the enterprise; and "to the more vulgar class," says Mr Hallam, "were held out inducements which, though absorbed in the overruling fanaticism of the first Crusade, might be exceedingly efficacious when it began to flag. During the time that a crusader bore the cross, he was free from suits for his debts, and the interest of them was entirely abolished; he was exempted, in some instances at least, from taxes, and placed under the protection of the church, so that he could not be impleaded in any civil court, except in criminal charges or questions relating to land." It was in the spring of the year 1096, that Peter the Hermit set out for Judea, at the head of a promiscuous assemblage of 80,000 men, with sandals on his feet, a rope about his waist, and every other mark of monkish austerity. Soon after, a more numerous and better disciplined force of 200,000 followed, including some able and experienced leaders. Godfrey of Bouillon, Robert, Duke of Normandy (son of William the Conqueror of England), the Counts of Vermendois, Toulouse, and Blois, are a few of the more illustrious. The progress of this immense mass of human beings on their journey was marked by misery and famine. They had vainly trusted to Heaven for a supernatural supply of their wants, and in their disappointment, they plundered all that came in their way. "So many crimes and so much misery," says Mr Hallam, "have seldom been accumulated in so short a space, as in the three years of the first expedition;" and another historian says, that a "fresh supply of German and Italian vagabonds," received on the way, were even guilty of pillaging the churches. It is certain that before the hermit reached Constantinople, the number of his forces had dwindled down to 20,000. Alexis Comnenus, then Emperor of Constantinople, who had applied to the states of Europe for assistance, without much hope of obtaining it, in order that he might be enabled to resist a threatened attack by the Turks upon himself, was surprised and terrified at the motley group of adventurers who had now reached the shore of his dominions. He readily afforded them the means of transporting themselves across the Bosphorus, and performed the same friendly office to the larger force which followed under Godfrey and others; glad, apparently, to have the barbarians of the north, as his subjects called them, out of his dominions. The Sultan Solyman met the army of the hermit, if army it could be called, and cut the greater part of it to pieces on the plains of Nicea. The second host proved more successful. In spite of their want of discipline, their ignorance of the country, the scarcity of provisions, and the excess of fatigue, their zeal, their bravery, and their irresistible force, enabled them twice to overthrow old Solyman, to take his capital, Nice, and, after an obstinate resistance, the city of Antioch also. (1098). At length (1099) they reached Jerusalem, much diminished in numbers and broken in spirit; but, with persevering assiduity, they proceeded to lay siege to the city, and in six weeks they became its masters. Their cruel conduct to the inhabitants attests the barbarous feelings of their hearts. "Neither arms defended the valiant, nor submission the timorous; no age nor sex was spared; infants on the breast were pierced by the same blow with their mothers, who implored for mercy; even a multitude of ten thousand persons, who had surrendered themselves prisoners and were promised quarter, were butchered in cool blood by these ferocious conquerors. The streets of Jerusalem were covered with dead bodies. The triumphant warriors, after every enemy was subdued and slaughtered, turned themselves, with the sentiments of humiliation and contrition, towards the holy sepulchre. They threw aside their arms, still streaming with blood; they advanced with reclined bodies and naked feet and heads, to that sacred monument; they sung anthems to him who had purchased their salvation by his death and agony; and their devotion, enlivened by the presence of the place where he had suffered, so overcame their fury, that they dissolved in tears, and bore the appearance of every soft and tender sentiment. So inconsistent is human nature with itself, and so easily does the most effeminate superstition ally, both with the most heroic courage and with the fiercest barbarity."

With a becoming foresight, the Crusaders established a Christian kingdom in the heart of Palestine; and at the head of it, by universal consent, was placed God-

* Mr Hallam mentions, as corroborative of this general belief, that charters at this period usually commenced with these words: "As the world is now drawing to its close;" and that an army, marching under the Emperor Otho I., was so terrified by an eclipse of the sun, which it conceived to announce this consummation, as to disperse hastily on all sides.

frey, whose goodness and justice had signalised him, and gained him respect, in the midst of the general wickedness. The pope, however, was too eager to enjoy the triumph to which he had looked forward, and sending an ignorant and obtruding ecclesiastic to assume this command, Godfrey retired; and thus was lost, undoubtedly, the best chance that Europeans ever had of really possessing the Holy Land. The Turks had now time to recover their strength and renew their attacks: they did so: many of the Crusaders had in the mean time returned home, and those of them who remained, surrounded and menaced by such foes, at last implored aid from Christendom. There the spirit which had been raised by Peter the Hermit was far from being extinguished; and another, more eloquent and more learned than Peter, namely St Bernard, had arisen to keep alive the flame of devotion. Roused by his preachings, Europe sent forth a second Crusade (1147). It consisted of 200,000 French, Germans, and English, in two divisions, the first led on by Conrad III. of Germany, and the second by Louis VII. of France. Strangely enough, both these leaders permitted themselves to be drawn into a snare by false guides, furnished by the Greek Emperor; and both armies, one after another, were withdrawn amidst the rocks of Laodicea, and, after being nearly starved by famine, they were cut to pieces by the Sultan of Iconium. This Crusade proved the most disastrous of them all. "Thousands of ruined families," says Russell, "exclaimed against St Bernard for his deluding prophecies: he excused himself by the example of Moses, who, like him, he said, had promised to conduct the Israelites into a happy country, and yet saw the first generation perish in the desert."

It was shortly after this period that the illustrious Saladin appeared (1180). Born among an obscure Turkish tribe, this individual fixed himself by his bravery and conduct on the throne of Egypt, and began to extend his conquests in the east. The still existing, though wretchedly supported kingdom of the Christians in Palestine, proving an obstacle to the progress of his arms, Saladin directed his power against it, and, assisted by the treachery of the Count of Tripoli, he completely overcame the Christians in battle (1187). The holy city itself fell into his hands, after a feeble resistance; and, except some cities on the coast, nothing remained to the Christians of all that, a century before, it had cost Europe so much to acquire. The followers of the cross, however, were not yet wholly disheartened; and a third great Crusade was entered into before the end of the twelfth century. The three greatest sovereigns of Europe, Frederick Barbarossa of Germany, Philip Augustus of France, and Richard Cœur de Lion of England, all took part. The forces of Frederick were earliest in the field. He had passed through the unfriendly territories of the Greek empire, crossed the Hellespont, and defeated the infidels in several battles, before Richard or Philip had stirred from home. The Christians of the East were beginning to look with hope and pride on so great assistance; but they seemed fated to be unfortunate. Frederick died (1190), from having thrown his body, heated by exertion, into the cold river of Cydnus; and his army, like the others that had gone before it, dwindled into nothing. The united armies of Richard and Philip followed. In their progress, the feelings of envy and national hatred rose above the object which had brought them together. Philip returned, disgusted or dismayed, shortly after they reached their destination; and Richard was thus left alone to uphold the glory of European arms. He did it nobly. With a mixed army of French, German, and English soldiers, amounting in all to 30,000, Richard performed feats of valour which have not been surpassed in the history of any time or nation. On the plains of Ascalon, a tremendous battle was fought with Saladin, and that brave and great man was defeated, and 40,000 of his soldiers are said to have been left dead upon the field of battle. But this conquest was unavailing, and the followers of Richard began to fear that there would be no end to their struggles. The zeal which had brought so many of them from their homes, and sustained them so long in absence, at last abated. Saladin readily concluded a treaty by which Christians might still be permitted to visit the tomb of Christ unmolested, and Richard left the Holy Land for ever. It is due to the memory of Saladin (who did not long survive this period) to state, that, after he made himself master of Jerusalem, he never molested the Christians in their devotions—a circumstance which, by contrast, reflects infinite disgrace on the cruel barbarities of the first Crusaders. In his last will, he ordered alms to be distributed among the poor, without distinction of Jew, Christian, or Mahometan; intending by this bequest to intimate, that all men are brethren, and that when we would assist them, we ought not to inquire what they believe, but what they feel—an admirable lesson to Christians, though from a Mahometan. But the advantages in science, in moderation, and humanity, seem at this period to have been all on the side of the Saracens.

There were no more great Crusades. Considerable bands of private adventurers still continued to move eastward; but disaster and disgrace attended every effort, and Europe at last became disheartened, when the bones of two millions of her sons lay whitened on the plains of Asia, and so little had been accomplished. Nevertheless, in the year 1202, Baldwin, Count of Flanders, was able to raise another considerable army for the rescue of the Holy Sepulchre; but having reached Constantinople at a time when there was a dispute in the succession to the throne, he readily laid aside the project of the Crusade, took part in the quarrel, and in the course of five months he was himself the emperor. The citizens of Venice, in Italy, who had lent their vessels for this enterprise, shared in the triumphs of the piratical Crusaders; they obtained the Isle of Candia, or Crete. Baldwin, however, was soon driven from the throne and murdered, though the Latins, as his successors from the west were called, kept possession of Constantinople for fifty-seven years.

At this period (1227) a great revolution took place in Asia. Gengis Khan, at the head of a body of Tartars, broke down from the north upon Persia and Syria, and massacred indiscriminately Turks, Jews, and Christians, who opposed them. The European settlements in Palestine must soon have yielded to these invaders, had not their fate been for a while retarded by the last attempt at a Crusade under Louis IX. of France. This prince, summoned as he believed by Heaven, after four years' preparation, set out for the Holy Land, with his queen, his three brothers, and all the knights of France (1248). His army began their enterprise, and we may say ended it also, by an unsuccessful attack on Egypt. The king went home, and reigned prosperously and wisely for thirteen years; but the same frenzy again taking possession of him, he embarked on a Crusade against the Moors in Africa, where his army was destroyed by a pestilence, and he himself became its victim (1270).

Before the end of the thirteenth century (1291) the Christians were driven out of all their Asiatic possessions. "The only common enterprise," says Robertson, "in which the European nations were engaged, and which they all undertook with equal ardour, remains a singular monument of human folly."

INSTITUTION OF CHIVALRY.—STATE OF EUROPE DURING AND AFTER THE CRUSADES.

Among the most remarkable institutions of the middle ages, was that of Chivalry. The institution was certainly not the result of caprice, nor a source of unmixed extravagance, as it has been represented, but an effort of human nature to express its feelings of love, honour, and benevolence, at a time when the spirit of liberty was extinguished, and religion had become debased. The feudal state was a state of perpetual war, rapine, and anarchy, during which the weak and unarmed were often exposed to injuries. Public protective law scarcely had an existence; and in these circumstances assistance came oftenest and most effec-

tually from the arms of private friends. It was the same feeling of courage, united to a strong sense of duty, which both gave rise to chivalry, and led such multitudes to join the Crusades. Chivalry existed before them, and it survived them. Those who devoted themselves to a life of chivalry were called knights, and sometimes knight-errants, in allusion to their habits of wandering from one country to another in search of helpless objects, which their generosity might find a pleasure in relieving and defending. Admission to the order of knighthood was long reckoned an honour of the highest sort; and to fulfil the vows which entrants took upon them, might well be considered so. They were bound, "by God, by St Michael, and St George," to be loyal, brave, and hardy; to protect the innocent, to redress the injuries of the wronged; and, above all, to uphold and defend the characters of women. The institution of chivalry is sometimes thought to have thrown an air of ridiculousness upon every thing connected with the softer sex, and some of the vagaries of knight errantry give sufficient countenance to such a supposition; but on the whole we are bound to rate its beneficial influences in elevating the female character high indeed, when we contrast the gross and grovelling situation held by the sex in former times with the high and virtuous emotions that we have learned to associate in modern times with the name of woman. If the whole of this effect is not to be ascribed to chivalry, not a little of it must certainly be so; nor do its beneficial effects end here. The feelings of honour, courtesy, and humanity, which distinguished it, spread themselves into other parts of conduct. War, in particular, was conducted with less ferocity, and humanity came to be deemed as necessary to an accomplished soldier as courage. The idea of a *gentleman* is wholly the production of chivalry; and during the twelfth, thirteenth, fourteenth, and fifteenth centuries, a sense of honour and a refinement of manners towards enemies sprung up, which have extended to modern times, and form a distinguishing feature of them.

The history of the Crusades has carried us over nearly two centuries of the history of Europe. But Europe might be said, almost without exaggeration, to have been then in Asia. It was certainly not the scene of any transaction of importance during all that period. The numerous quarrels, both public and private, which had before agitated the several countries, and had constituted all their history, gave way, by mutual consent, as well as by the orders of the church, to the one idea which then reigned supreme among them. Society was thus unconsciously the means of permitting some of those powerful and pacific principles to come into play, which were soon to give it a new destiny. The absence of so many great barons, during the time of the Crusades, was a means of enabling the common people, who had hitherto lived as their slaves, to raise themselves in public standing and estimation; while the possessions of many of these barons, by sale or the death of their owners without heirs, reverted to the sovereigns. In this way the power of the people and of royalty advanced together, and both at the expense of the class of nobility. The people were not unwilling to exchange the mastery of inferiors for that of a superior; and the kings on their part looked on this rising power of the people with pleasure, as it offered a shield to protect them from the insolence of the nobles. In these circumstances boroughs began to flourish. This was a new element in the progress of civilisation. Men who had hitherto skuiked in castles, and had sacrificed their liberties and their lives for bread and protection from isolated chiefs, now found that, by a union among themselves, they might secure bread by industry, and protection and liberty by mutual aid. Multitudes, therefore, forsook their feudal subservience to enjoy independent citizenship. Villeins, or labourers, joyfully escaped to take their place on a footing of equality with freemen; and sovereigns found means to pass a law that, if a slave should take refuge in any of the new cities, and be allowed to remain there unclaimed for a twelvemonth, he had thereby become free, and was hencef member of the community. Another impro which kings were able to introduce about this ti the gradual abolition of minor courts of justice, barons had previously held in their several dc and their getting public and universal law admin by judges of their own appointment. Even singl bat, the practice most inveterately adhered to among the ancient nobles, became less freque less honourable. The more revolting and absu tures of it were wholly abolished, though the gr surdity, and indeed the great crime itself, car said to have become totally extinct, even up to o day, when we recollect that the barbarous pra duelling is still permitted to exist.

The effect, however, produced by the Crusades proved greatest in its consequences, though per was the most unlooked for at the time, was the commerce. The first of these expeditions had jou to Constantinople by land; but the sufferings v great, that all the rest were induced to go by sea Italian cities of Venice, Genoa, and Pisa, furnisl vessels which conveyed them; and the sums of obtained for the freight of so many and so great were immense. This, however, was but a sma of what the Italian citizens gained by the expe to the Holy Land. The Crusaders contracte them for military stores and provisions; and any Asiatic possessions of value, which came temp into the hands of the Christians, became empori commerce for them. The sweet reward of labo thus first felt for ages in Europe. New art brought from the east, and many of those natur ductions of the warmer climates were first intr into the west, which have since afforded the m of a lucrative and extended commerce. We will in a separate section to the brilliant career of i of the Italian Republics.

In these views we represent the fairest side picture. There were yet many obstacles in the a complete and harmonious evolution of the pri of civilisation. But the elements all seemed have acquired existence, and time only was re to consolidate and strengthen them.

CONTINUATION OF THE HISTORY OF EUROPE T MIDDLE OF THE FIFTEENTH CENTURY.—RISE O NEW POWERS.

The most remarkable general feature of Eu society about the time of the Crusades was the influence. Between the pontiffs and the Germ perors there was kept up a perpetual struggle for but for a long time the advantage was almost with the popes. The treatment which some emperors received from them was extremely liating. Frederick Barbarossa was compelled the feet of his holiness, Alexander III., and to a him by a large cession of territory, after having nantly denied his supremacy, and refused the cust homage. Henry VI., while doing homage on his had his imperial crown kicked off by Pope Cele who, however, made some amends for this indig the gift of Naples and Sicily. Henry had expel Normans from these territories, which now l appendages of the German empire (1194). In t ginning of the thirteenth century, Pope Innoce was imagined to have permanently establishe powers of the holy see, and its right to confer t perial crown; but this proved far from being th In the time of Frederick II., who succeeded Ot (1212), the old contentions rose to more than th height, and two factions sprung up in Italy, kn the names of Guelphs and Ghibellines, the f maintaining the supremacy of the popes, and the that of the emperors. Frederick maintained th test which now arose between himself and the with much spirit; but, on his death (1250 splendour of the empire was for a considerabl

red. At length, Rodolph of Hapsbourg, a Swiss , was elected emperor (1274). Rodolph became under of the house of Austria, and ruled with rigour and moderation. His son, Albert I., was the s of causing the inhabitants of Switzerland to as- nd obtain their liberty, by his attempting to bind in subjection to one of his children, and then force to compel them. In the pass of Morgarten, ll army of four or five hundred of these brave taineers defeated an immense host of Austrians 5). Sixty pitched battles, it is said, were fought een the contending parties; but the spirit of Wil- Tell, who appeared at this time, and of his patriot rymen, rose above all attempts to enslave them; the Swiss cantons secured a freedom which their endants enjoy to this day. The further history of many, for nearly a century, is not politically impor- . Disputes between the emperors and the papacy continued, though the balance of advantage was oftener against the church. About the beginning he fifteenth century the great papal schism, as it called, took place. It arose from there being no er than three different claimants for the chair of Peter—Gregory XII., who was owned Pope by the lian states; Benedict XIII., by France; and Alexan- V., a native of Candia, by a number of the cardinals. schism proved very hurtful to the authority of the rch, though in that respect it benefited the interests ociety, and contributed to open men's eyes. The earance of John Huss at this time aided in producing effect. Huss proclaimed the same opinions as the English reformer Wickliffe. He was branded, of se, by the clergy as a heretic and propagator of tion. The general council of the Church, held at stance (1514), concocted no fewer than thirty-nine les in which Huss is said to have erred. Some of points he denied having professed, and others he ed to support by argument; but his voice was rned by the clamours of bigotry. His hair was n the form of a cross; upon his head was put a r mitre, painted with the representation of three ls; and he was delivered over to the secular judge, condemned both him and his writings to the flames. milar fate shortly after befell his disciple, Jerome ague, who is said to have exhibited the eloquence apostle and the constancy of a martyr at the (1416). In revenge for these cruelties, the Hus- of Bohemia kept up a war with the empire for ty years; and it was only after having their right press their opinions acknowledged that they de- d. The great schism lasted for many years. A olitan archbishop, named Bari, was elected and ed by the resident cardinals at Rome within a months. Boniface IX. and Innocent VI. were each orarily his successors. The result of the lengthened te may be stated to be, that papal authority was ly weakened; the government of the church was ght down among a class of ecclesiastics that had r before tasted the sweets of power, and future s were obliged to resort to such questionable prac- for the maintenance of their dignity, that men in ral began to lose respect for their sanctity, and a dation was laid for changes which it fell to the lot ther and others to effect.

e period which witnessed these transactions was rkable for the continued wars between France and land. In the beginning of the twelfth century, the us dispute for supremacy arose between Thomas- cket, Archbishop of Canterbury, and Henry II., h ended in the death of the prelate (1171), but in the ph of his principles. The beginning of the thir- h century is memorable in English history, as g witnessed the granting of the Magna Charta by John; and towards the conclusion of it appeared ard I., whose name is associated with the first t attempts to subdue the Scots on the part of Eng- The bravery of Wallace and of others averted calamity for ever. Wales was not so fortunate; Ireland had already become a conquered province. The grandson of Edward I., named Edward III., proved himself as ambitious and as sagacious as his predecessor. His attention, however, was greatly diverted from the kingdom of Scotland to that of France, with which country he commenced a war that proved greater in duration and extent than any that had occurred in Europe since the fall of the Roman empire. The proposal of subduing so great a country as France, and seating himself upon the throne of it, seemed at first to be the proposal of a madman; but in less than twenty years Edward had so effectually dismembered the different provinces, alienating some of the nobility and overawing others, that his attaining the object of his desires seemed by that time no improbable nor distant reality. His son, known in history as Edward the Black Prince, named so from the colour of his armour, contributed much, by his presence and his valour, to the success of the English arms. In the battle of Cressy, fought in 1346, with numbers greatly on the side of France, and in that of Poictiers, fought ten years later, under similar circumstances, the English were completely victorious. John, King of France, was taken prisoner, and the conduct of young Edward to his fallen enemy was generous and delicate in the highest degree, so that the French prisoners are said to have been overcome by the display of such an elevation of mind on the part of their conqueror, and to have burst into tears. This refinement was the result of chivalry, which both the Edwards attached themselves to, and rendered respectable by their virtues.

France was at this time in a deplorable state. A foreign enemy in the heart of the kingdom, the king a prisoner, the capital in sedition, and civil war raging over and above all—these were some of her accumulated misfortunes; and as if nature meant to conspire with man for her destruction, a plague broke out at this time among the people, and consummated the work of famine and the sword. This plague, however, was not confined to France, though, from the dilapidated state of that country, it proved perhaps in it most disastrous. It invaded every kingdom of Europe, and the English historian, Hume, computes that it swept away about one-third of the inhabitants of every country that it attacked. The origin of the disease is not well known; but there can be no doubt that it could only have made the ravages which it did among nations uncivilised and ignorant, heedless of all the cleanliness and comforts which we know, in modern times, to be necessary to the preservation of health. According to the ordinary account, this pestilence took its rise in the Levant about the year 1346, from whence Italian traders brought it to Sicily, Pisa, and Genoa. In 1348, it passed the Alps, and spread over France and Spain. In the next year it reached Britain, where, in London alone, 50,000 persons are said to have become its victims; and in 1350, it laid waste Germany and other northern states, lasting generally in each country about five months. At Florence more than three out of every five of the inhabitants were swept away. It is well known to those acquainted with Italian literature, that the time of Boccaccio's Decameron is laid during this pestilence.

While the plague lasted, a temporary truce had been agreed upon between the French and English. At that time the balance of advantage was greatly in favour of the English. Not to mention less important gains, all Guienne, Gascony, Poitou, Saintonge, the Limousin, and the Angoumois, as well as Calais, and the county of Pointhieu, were ceded in full sovereignty to Edward, and the empty title of King of France was all that he became bound to give up (1360). But it was found impossible to retain possessions in the heart of a foreign country, though won by consummate bravery and ruled with no imprudence. In less than ten years (1368), the war was recommenced, and the English began to lose many of the provinces which they had previously acquired. Charles V., who had acted as regent in France during the captivity of his father John, and was now his successor on the throne, contributed greatly by his

wisdom to this result; and his general, Du Guesclin, contributed not less to it by his valour. England had lost both its Edwards, and Richard II. proved destitute of abilities for leading on the enthusiasm of his countrymen to any thing great. Charles died prematurely, however, a circumstance which proved unfortunate for France, as his son, the sixth of the same name, was a very unworthy successor. For forty years, Charles VI. may be said to have borne the name of king, rather than to have reigned in France. The wealth accumulated by Charles the Wise, was, in the first place, stolen by the Duke of Anjou, and afterwards, by reason of want of funds, and misapplication of what they had, Charles VI. and his ministers were fully more engaged in quarrels with the citizens of Paris and other subjects, than in any becoming efforts to expel the English. History records, however, that the king became totally imbecile in mind (1393), so that he was, by universal consent, excluded from all share in the government, and the houses of Burgundy and Orleans long struggled for the regency. At this period, Henry V. of England put in a claim for the government of the kingdom, on the strength of a distant relationship to the reigning family; and, after having gained the memorable battle of Agincourt (1415), he was actually promised the throne on the death of Charles, though his own death prevented this from ever taking place. It may be worth remarking, that *cards* were invented in this age. The desire to amuse the silly king of France was the cause. In the year 1422, Charles VII., surnamed the Victorious, was crowned King of France at Poictiers, while the crown was claimed on the part of Henry VI. of England, yet an infant. The war continued, and the English were like to have proved victorious, when a simple maiden, named Joan of Arc, made her appearance at the head of the armies of France, and turned the tide of fortune in favour of her country. Apparently mistaking the impulses of superstition for divine inspiration, she gave out that she had been commissioned by Heaven to save her country; and having succeeded in inspiring the French soldiery with that belief, she led them on to battle, and they proved victorious. It must be recorded, to the disgrace of our countrymen, that Joan, being shortly after taken prisoner, was condemned to be burnt as a sorceress. The French, however, were but the more exasperated at this; and their victory of Formigny, and the death of Talbot, perhaps the greatest English warrior of the age, now left them in possession of all their country, with the exception of Calais and Greignes (1450).

Of all that was done by England to obtain a footing in France, a barren title to our sovereigns alone is all that was preserved till a recent period. The power and spirit of the French nation rose above all calamities, and in less than half a century, having freed herself of every enemy at home, her arms were in a condition to be directed externally with effect. The invasion of Naples by Charles VIII. was the event that first engaged the principal states of Europe in relations of alliance or hostility, which may be deduced to the present day, and is the point which most appropriately terminates the history of the middle ages.

During this period, several of those countries in the north of Europe, which have made a considerable figure in modern history, for the first time attracted attention. The greatest of these was Russia. In the middle of the thirteenth century, the tribes of Tartary made a complete conquest of this country, and for about a hundred years they maintained their supremacy. At length Ivan ascended the throne of Moscow (1462), and overcoming the Tartars, established a kingdom of his own, and was able to form an alliance with the Emperor Maximilian of Germany, who did not hesitate to style him brother. This was the first entrance of Russia into European politics.

Before the end of the fourteenth century, the Christian religion had penetrated into Denmark, Sweden, Prussia, and Poland; but it failed in producing any immediate beneficial effect. The political events which took place in these countries, however, were very various at this period, but proved too unimportant their results to admit of being even outlined here.

THE ITALIAN REPUBLICS.—COMMERCE IN GENERAL.

Among the Italian cities, Venice, at the extremity the Adriatic, Ravenna, at the south of the mouth of t Po, Genoa, at the foot of the Ligurian mountains, Pi towards the mouths of the Arno, Rome, Gaëta, Napl Amalphi, and Bari, were either never conquered the Lombards, or were in subjection too short a tir to have lost many of their ancient habits and custom In this way, these cities naturally became the refu of Roman civilisation, at a time when other parts Europe were wading through barbarian darkness. T feudal system never prevailed among them with a force; and several of these and other cities had impo tant privileges conferred upon them by the Germ emperors at a very early period. Sismondi, the hist rian of Italy, asserts that Otho I. (936) erected son of them into municipal communities, and permitt them the election of their own magistrates. It is ce tain that, in 991, the citizens of Milan rose in tumu expelled an archbishop from their city, and were ab to establish a qualified right to interfere in future ele tions. The after history of Milan is eventful and tr gical; but we can only give a short account of it her In the middle of the twelfth century, Frederic Barba rossa became engaged with the cities of Lombardy, an particularly with it, in extensive and destructive war In the year 1162, Milan was finally overcome; the walls and houses were razed from their foundation, and the suffering inhabitants dispersed over other cities, ob taining sympathy in their distress, and communicating their enthusiastic love of freedom in return. The republican form of government was adopted in every considerable town; and before the end of the thirteenth century, there was a power and knowledge among these apparently insignificant republics that all Europe could not match.

The beneficial though unlooked-for effect of the Crusades upon commerce has already been mentioned. During the twelfth and thirteenth centuries, the commerce of Europe was almost entirely in the hands of the Italians, more commonly known in those ages by the name of Lombards. The republic of Pisa was one of the first to make known to the world the riches and power which a small state might acquire by the aid of commerce and liberty. Pisa had astonished the shores of the Mediterranean by the number of vessels and galleys that sailed under her flag, by the succour she had given the Crusaders, by the fear she had inspired at Constantinople, and by the conquest of Sardinia and the Balearic Isles. Immediately preceding this period, those great structures which still delight the eye of the traveller—the dome, the baptistry, the leaning tower, and the Campo Santo of Pisa, had all been raised; and the great architects that spread over Europe in the thirteenth century, had mostly their education here. But unfortunately, the ruin of this glorious little republic was soon to be accomplished. A growing envy had subsisted between it and Genoa during the last two centuries; and a new war broke out in 1282. It is difficult to comprehend how two simple cities could put to sea such prodigious fleets as those of Pisa and Genoa. Fleets of thirty, sixty-four, twenty-four, and one hundred and three galleys, were successively put to sea by Pisa, under the command of able generals; but on every occasion the Genoese were able to oppose them with superior fleets. On the 6th of August 1284, the Pisans were defeated in a naval engagement before the Isle of Meloria: thirty-five of their vessels were lost, five thousand persons perished in battle, and eleven thousand became prisoners of the Genoese. After a few further ineffectual struggles, Pisa lost its standing.

The greatest commercial, and altogether the most remarkable city of the Italian republics, was Venice. Secluded from the world, on a cluster of islands in the Adriatic, the inhabitants of this city had taken up their abode in the course of the fifth century, and they boasted

themselves to have been independent of all the revolutions which Europe had been undergoing since the fall of the Roman empire. This might be true to a great extent, though for long it was certainly more the result of their obscurity than their power. By the tenth century, however, the descendants of those fishermen that had first taken refuge here, were able to send fleets abroad which could encounter and overawe both Saracens and Normans. The Venetians had all along kept up a correspondence with Constantinople during the darkest periods of the middle ages. This was greatly renewed and extended about the time of the Crusades. When Constantinople was taken by the Latins (1204), the Venetians, under their doge, or chief magistrate, Henry Dandalo, became possessed of three-eighths of that great city and of the provinces, and Dandalo assumed the singularly accurate title of Duke of three-eighths of the Roman Empire. The Venetians greatly increased their share of the spoil by making advantageous purchases from the more needy of the Crusaders. Among the most important of these was the Isle of Candia, which they retained till the middle of the seventeenth century. The idea of a bank took its rise in this city, and an establishment of that nature, simply for the receipt of deposits, is said to have existed in it as soon as the year 1157. But it was not till about a century later that banking, as the term is now understood, began at all to be practised. The merchants of Lombardy and of the south of France, began at that time to remit money by bills of exchange, and to make profit upon loans. The Italian clergy who had benefices beyond the Alps, found the new method of transmitting money exceedingly convenient, and the system of exacting usury or interest, after experiencing every obstruction from ignorance and bigotry, became a legal part of commerce. In the thirteenth century the government of Venice was entirely republican; but continued wars with Genoa reduced both cities. These wars were all conducted on the seas, and the display of naval strength on both sides seems prodigious when we reflect on the poor condition of Italy at the present day. Besides these wars for objects of ambition, there were continual jealousies which rose above enlightened views of self-interest, and led to the most disgraceful broils. At the middle of the fourteenth century, a battle took place between the rival citizens, in which the Genoese were defeated. Their loss was immense, and in distress and in revenge they gave themselves up to John Visconti, Lord of Milan, then the richest and among the most ambitious of the petty tyrants of Italy, hoping that he would give them the means to re-establish their fleet and continue the war with the Venetians. He did so, and in another naval engagement, fought in 1354, in the Gulf of Sapienza, the Venetians were entirely defeated. But the Genoese had sacrificed their liberty in their thirst for revenge. Visconti became their master, instead of friend. Venice was able to rise above its temporary discomfiture, and during the fifteenth century its fame and power became greater than they had ever been before. In the beginning of the fifteenth century the Venetians captured the town of Padua, and gradually lost their empire of the sea, while they acquired possessions on the continent.

Among the most famous of the Italian states at this period was Florence; and its fame was founded, not on arms but on literature. Like the other Italian cities, however, it owed its first elevation to the commercial industry of its inhabitants. There was a curious division of the Florentine citizens, subsisting about the beginning of the thirteenth century, into companies or *arts*. These were at first twelve, seven called the greater arts, and five the lesser; but the latter were gradually increased to fourteen. The seven greater arts were those of lawyers and notaries, of dealers in foreign cloth, called sometimes *calimala*, of bankers or money-changers, of woollen-drapers, of physicians and druggists, of dealers in silk, and of furriers. The inferior arts were those of retailers of cloth, butchers, smiths, shoemakers, and builders. It was in the thirteenth century that Florence became a republic, and it maintained its independence for two hundred years. In the beginning of the fifteenth century, it became peculiarly distinguished by the revival of Grecian literature and the cultivation of the fine arts. Cosmo de Medici, who lived a citizen of Florence at this time, and was known by the name of the Grand Duke of Tuscany, descended from a long line of ancestors whose wealth had been honourably acquired in the prosecution of the *greater arts*, had more riches than any king in Europe, and laid out more money on works of learning, taste, and charity, than all the princes of his age put together. The same liberality and munificence distinguished his family for several generations.

The commercial success of the states of Italy induced the inhabitants of northern Europe to attempt similar enterprises. In the thirteenth century the sea-ports on the Baltic were trading with France and Britain, and with the Mediterranean. The commercial laws of Oleron and Wisbuy (on the Baltic) regulated for many ages the trade of Europe. To protect their trade from piracy, Lubec, Hamburgh, and most of the northern sea-ports, joined in a confederacy, under certain general regulations, termed the *League of the Hanse Towns;* a union so beneficial in its nature, and so formidable in point of strength, as to have its alliance courted by the predominant powers of Europe. "For the trade of the Hanse towns with the southern kingdoms, Bruges on the coast of Flanders was found a convenient entrepôt, and thither the Mediterranean merchants brought the commodities of India and the Levant, to exchange for the produce and manufactures of the north. The Flemings now began to encourage trade and manufactures, which thence spread to the Brabanters; but their growth being checked by the impolitic sovereigns of those provinces, they found a more favourable field in England, which was destined thence to derive the great source of its national opulence."—(*Tytler.*)

THE TURKS.—FALL OF CONSTANTINOPLE.

We have already seen the weakness of the empire of Constantinople at the time of the Crusades; we have seen the city sacked and the government seized by the champions of the cross. The Greeks regained their empire in the year 1261, but in a mangled and impoverished condition. For nearly two centuries it continued in a similar state. Andronicus, son of Michael Palæologus, who had restored the Greek empire, allowed himself to be persuaded that, as God was his protector, all military force was unnecessary; and the superstitious Greeks, regardless of danger, employed themselves in disputing about the transfiguration of Jesus Christ, when their unfortunate situation made it necessary that they should have been studying the art of war, and training themselves to military discipline.

In the mean time, the Turks had become a powerful people. They had embraced the Mahometan religion long before the time of the Crusades, and proved powerful obstacles to the success of those expeditions. About the beginning of the fourteenth century, they established an empire of their own in Asia Minor, under Othman or Ottoman, and to this day the Ottoman Empire is a name given to the dominions of their descendants. By degrees they encroached on the borders of the empire of Constantinople, and they were only prevented from subverting it at a much earlier period than they did, by being called upon to defend themselves from the arms of an eastern conqueror who arose at this time. Tamerlane, otherwise called Timerbek, was a prince of the Usbek Tartars, and a descendant from Gengis Khan. After having overrun Persia, and a great part of India and Syria, this great conqueror was invited by some of the minor princes of Asia, who were suffering under the Ottoman tyranny, to come and protect them. Tamerlane was flattered by the request, and having brought a great army into Phrygia, he was there met by Bajazet, the Ottoman emperor, who readily gave battle, and was defeated and made prisoner (1402).

about the close of the tenth and beginning of the eleventh century, and which gained universal credit, wonderfully augmented the number of credulous pilgrims, and increased the ardour with which they undertook this useless voyage. The thousand years mentioned by St John [Rev. xx. 2, 3, 4] were supposed to be accomplished, and the end of the world to be at hand. A general consternation seized mankind; many relinquished their possessions, and, abandoning their friends and families, hurried with precipitation to the Holy Land, where they imagined that Christ would quickly appear to judge the world."

While Palestine continued subject to the caliphs, they had encouraged the resort of pilgrims to Jerusalem, and considered this as a beneficial species of commerce, which brought into their dominions gold and silver, and carried nothing out of them but relics and consecrated trinkets. But, the Turks having conquered Syria about the middle of the eleventh century, pilgrims were exposed to outrages of every kind from these fierce barbarians. This change happening precisely at the juncture when the panic terror which I have mentioned rendered pilgrimages most frequent, filled Europe with alarm and indignation. Every person who returned from Palestine related the dangers which he had encountered, in visiting the holy city, and described with exaggeration the cruelty and vexations of the Turks."

Among the most notorious of those who had returned with these accounts, was a monk known by the name of Peter the Hermit. By all accounts this individual seems to have been a weak-minded and contemptible being. He is represented as running from city to city, and from kingdom to kingdom, bare-headed, with naked arms and legs, and bearing aloft a ponderous crucifix in his hand, imploring and preaching with an enthusiastic madness on the necessity of wresting the Holy Land from the hands of the infidels. In a more enlightened age, Peter the Hermit would probably have been confined as a troublesome lunatic; in this, however, he was not only allowed to go on, but encouraged and abetted in his career. The ambitious Hildebrande had expressed a strong desire to send armed forces from Europe to exterminate the Mahometans from Palestine, in order that another country might be brought under his spiritual subjection; and Urban II., who at this time occupied the chair of St Peter, warmly seconded the efforts of the enthusiastic monk. Nor was Peter's success small. Vast multitudes proclaimed themselves ready to engage in the undertaking. Two great councils of the church, one of them held at Placentia and the other at Clermont, in Auvergne, attended by prelates, princes, and immense multitudes of the common people, declared enthusiastically for the war (1095). The pope himself attended at the last, and Peter and he having both addressed the multitude, they all exclaimed, as if impelled by an immediate inspiration, "It is the will of God! it is the will of God!" These words were thought so remarkable, that they were afterwards employed as the motto on the sacred standard, and came to be looked upon as the signal of battle and of rendezvous in all the future exploits of the champions of the cross. Persons of all ranks now flew to arms with the utmost ardour. The remission of penance, the dispensation from those practices which superstition imposed or suspended at pleasure, the absolution of all sins, and the assurance of eternal felicity, were the rewards held out by the church to all who joined the enterprise; and "to the more vulgar class," says Mr Hallam, "were held out inducements which, though absorbed in the overruling fanaticism of the first Crusade, might be exceedingly acious when it began to flag. During the time that ler bore the cross, he was free from suits for his debts, and the interest of them was entirely abolished; he was exempted, in some instances at least, from taxes, and placed under the protection of the church, so that he could not be impleaded in any civil court, except in criminal charges or questions relating to land." It was in the spring of the year 1096, that Peter the Hermit set out for Judea, at the head of a promiscuous assemblage of 80,000 men, with sandals on his feet, a rope about his waist, and every other mark of monkish austerity. Soon after, a more numerous and better disciplined force of 200,000 followed, including some able and experienced leaders. Godfrey of Bouillon, Robert, Duke of Normandy (son of William the Conqueror of England), the Counts of Vermendois, Toulouse, and Blois, are a few of the more illustrious. The progress of this immense mass of human beings on their journey was marked by misery and famine. They had vainly trusted to Heaven for a supernatural supply of their wants, and in their disappointment, they plundered all that came in their way. "So many crimes and so much misery," says Mr Hallam, "have seldom been accumulated in so short a space, as in the three years of the first expedition;" and another historian says, that a "fresh supply of German and Italian vagabonds," received on the way, were even guilty of pillaging the churches. It is certain that before the hermit reached Constantinople, the number of his forces had dwindled down to 20,000. Alexis Comnenus, then Emperor of Constantinople, who had applied to the states of Europe for assistance, without much hope of obtaining it, in order that he might be enabled to resist a threatened attack by the Turks upon himself, was surprised and terrified at the motley group of adventurers who had now reached the shore of his dominions. He readily afforded them the means of transporting themselves across the Bosphorus, and performed the same friendly office to the larger force which followed under Godfrey and others; glad, apparently, to have the barbarians of the north, as his subjects called them, out of his dominions. The Sultan Solyman met the army of the hermit, if army it could be called, and cut the greater part of it to pieces on the plains of Nicea. The second host proved more successful. In spite of their want of discipline, their ignorance of the country, the scarcity of provisions, and the excess of fatigue, their zeal, their bravery, and their irresistible force, enabled them twice to overthrow old Solyman, to take his capital, Nice, and, after an obstinate resistance, the city of Antioch also. (1098). At length (1099) they reached Jerusalem, much diminished in numbers and broken in spirit; but, with persevering assiduity, they proceeded to lay siege to the city, and in six weeks they became its masters. Their cruel conduct to the inhabitants attests the barbarous feelings of their hearts. "Neither arms defended the valiant, nor submission the timorous; no age nor sex was spared; infants on the breast were pierced by the same blow with their mothers, who implored for mercy; even a multitude of ten thousand persons, who had surrendered themselves prisoners and were promised quarter, were butchered in cold blood by these ferocious conquerors. The streets of Jerusalem were covered with dead bodies. The triumphant warriors, after every enemy was subdued and slaughtered, turned themselves, with the sentiments of humiliation and contrition, towards the holy sepulchre. They threw aside their arms, still streaming with blood; they advanced with reclined bodies and naked feet and heads, to that sacred monument; they sung anthems to him who had purchased their salvation by his death and agony; and their devotion, enlivened by the presence of the place where he had suffered, so overcame their fury, that they dissolved in tears, and bore the appearance of every soft and tender sentiment. So inconsistent is human nature with itself, and so easily does the most effeminate superstition ally, both with the most heroic courage and with the fiercest barbarity."

With a becoming foresight, the Crusaders established a Christian kingdom in the heart of Palestine; and at the head of it, by universal consent, was placed God-

am mentioned as corroborative of this general belief, that the priest usually commenced with these words: rld is now drawing to its close," and that an army, *der the Emperor Otho I.*, was so terrified by an *sun, which it conceived to announce* this consum- *disperse hastily on all sides*

ment, or at least the elevation, of the University of Oxford. The first efforts, however, at literary improvement, were marred by the subtleties of scholastic divinity. Perhaps the greatest and wisest literary character of the middle ages was an English friar, named Roger Bacon. This extraordinary individual was not only learned, but, what was more uncommon in those times, he was scientific. Hallam asserts that he was acquainted with the nature of gunpowder, though he deemed it prudent to conceal his knowledge. He saw the insufficiency of school philosophy, and was the first to insist on experiment and the observation of nature as the fittest instruments by which to acquire knowledge. He reformed the calendar, and made discoveries in astronomy, optics, chemistry, medicine, and mechanics.

It is to Italy, however, that we owe the first and greatest exertions in the revival of letters. The spirit of liberty which had arisen among its republics was favourable to the cultivation of literature; and accordingly we find that not only did they produce many individuals who were most active and successful in bringing to light the relics of classical lore, but that there also arose among them men possessed of the highest order of original genius. Florence produced Dante so early as 1265. Dante was associated with the magistracy of his native city in his earlier years, but, having given dissatisfaction in that capacity, he was banished, and in his exile produced his great poem entitled the Divine Comedy. It is a representation of the three supposed kingdoms of futurity—Hell, Purgatory, and Paradise—divided into one hundred cantos, and containing about 14,000 lines. The poem has been much praised. Petrarch, born in the year 1304, was likewise a Florentine by birth. The misfortunes of his father had impoverished the family, and Petrarch was too proud to take the usual method of retrieving his affairs. His genius, however, earned for him the friendship of many Italian princes, and even of more popes than one, although he had exerted his talents to expose the vices of their courts. Petrarch's personal character seems to have exhibited some unamiable traits; but he has sung of love, friendship, glory, patriotism, and religion, in language of such sweetness and power as to have made him the admiration of every succeeding age. Boccaccio, like the two great poets named, was also a Florentine. He was born in 1313, and his name has descended to posterity less associated with his poetry than the light, elegant, and easy prose of his novels. These were the production of his idle hours; and his Latin works, on which he supposed his fame to rest, have long since been forgotten.

The discovery of Justinian's Laws, as detailed in the Pandects (see HISTORY OF LAWS), was another event which powerfully tended to modify the barbarism that prevailed during the middle ages in Europe.

The invention of the Mariner's Compass must be reckoned of still greater importance, and yet it is absolutely unknown to whom we owe it. That honour has been often bestowed on Gioia, a citizen of Amalphi, who lived about the commencement of the fourteenth century. But the polarity of the magnet at least was known to the Saracens two hundred years before that time; though even after the time of Gioia, it was long before the magnet was made use of as a guide in navigation. "It is a singular circumstance," says Mr Hallam, "and only to be explained by the obstinacy with which men are apt to reject improvement, that the magnetic needle was not generally adopted in navigation till very long after the discovery of its properties, and even after their peculiar importance had been perceived. The writers of the thirteenth century, who mention the polarity of the needle, mention also its use in navigation; yet Capmany has found no distinct proof of its employment till 1403, and does not believe that it was frequently on board Mediterranean ships at the latter part of the preceding age." The Genoese, however, are known in the fourteenth century to have come out of that inland sea, and steered for Flanders and England. But by far the greatest sailors of the age were the Spaniards and Portuguese. This latter nation had little or no existence during the greater part of the middle ages, but in the twelfth, thirteenth, and fourteenth centuries, they were able to expel the Moors from a great part of their country; and in the beginning of the fifteenth, John, surnamed the Bastard, who was then their king, was the first European prince who exhibited a respectable navy. It was in the year 1486 that this adventurous people first doubled the Cape of Good Hope.

The discovery of America (1493) may be mentioned supplementarily to the invention of the mariner's compass, as an event which, without it, could never have taken place. The immortal honour of that discovery rests with Christopher Columbus, a sailor of Genoa. After unsuccessful applications at almost every court in Europe, and braving obloquy and contempt, Columbus at last obtained a miserable force from Ferdinand and Isabella of Spain, and with no landmark but the heavens, nor any guide but his compass, he launched boldly into the sea, and at last conducted Europeans to the great western hemisphere. The importance of that discovery, and its effect on the destinies of mankind, are subjects on which it is not our present purpose to dilate.

In the course of the fourteenth and beginning of the fifteenth centuries, various discoveries in the arts were made, which powerfully tended to the advancement of society; among these the more important were the invention of gunpowder and fire-arms, clocks and watches, paper-making, and printing. This last, the greatest of all, prepared the way for the Reformation in religion, in the sixteenth century, by which religious was added to civil freedom, and a great spur given to individual activity.

Important as these events were in their ultimate tendencies, it is to be remembered that they did not immediately make any distinct change in the comforts of the people. In the latter centuries of the middle ages, the amusements of the common people were metrical and prose romances, unintelligible prophecies, and fables of giants and enchanters. The state of England and of France, at this period, shows the small advance which had been made towards those comforts and improvements which now exist. Even in the large cities, the houses were roofed with thatch, and had no chimneys. "The two most essential improvements in architecture during this period," says Mr Hallam, "one of which had been missed by the sagacity of Greece and Rome, were chimneys and glass windows. Nothing apparently can be more simple than the former; yet the wisdom of ancient times had been content to let the smoke escape by an aperture in the centre of the roof; and a discovery, of which Vitruvius had not a glimpse, was made, perhaps in this country [England], by some forgotten semi-barbarian. About the middle of the fourteenth century, the use of chimneys is distinctly mentioned in England and in Italy; but they are found in several of our castles which bear a much older date. This country seems to have lost very early the art of making glass, which was preserved in France, whence artificers were brought into England to furnish the windows of some new churches, in the seventh century. It is said that, in the reign of Henry III., few ecclesiastical buildings had glazed windows. Suger, however, a century before, had adorned his great work, the abbey of St Denis, with windows not only glazed but painted; and I presume that other churches of the same class, both in France and England, were generally decorated in a similar manner. Yet glass is said not to have been employed in the domestic architecture of France before the fourteenth century, and its introduction into England was probably by no means earlier. Nor, indeed, did it come into general use during the period of the middle ages. Glazed windows were considered as moveable furniture, and probably bore a high price. When the Earls of Northumberland, as late as the reign of Elizabeth, left Alnwick Castle, the windows were taken out of their frames and carefully laid by."

By far the finest specimens of architecture which

the middle ages produced, were the religious edifices built in the twelfth and three following centuries. The superstition of the times was favourable to the production of works of that sort. To leave one's means for such a purpose was deemed so meritorious as to entitle the donor to eternal happiness in the next scene of existence; and men in this world thought it a duty to render structures designed for purposes so sacred as beautiful and becoming as they could. It was about the middle of the twelfth century that what has been called the Gothic style of architecture took its rise, of which the peculiar feature is thought to be the pointed arch, formed by the segment of two intersecting semicircles, struck from points equidistant from the centre of a common diameter. This style of architecture has been said by different individuals to have originated in France, in Germany, in Italy, and in England. The truth is, we neither know where it originated nor from what source it was derived. It has afforded antiquaries a curious subject of speculation how so perfect a system, as this has been thought, should not only have originated but reached perfection in times so dark. Any effectual explanation is probably now impossible; the knowledge of the art was never permitted to go beyond a fraternity of freemasons, and it is not to be supposed that the early archives of that mysterious association have survived so many revolutions.

The living even of the highest nobility under the Edwards was such as would not prove very palatable to their luxurious descendants. They drank little wine, had no foreign luxuries, rarely kept male servants except for husbandry, and still more rarely travelled beyond their native country. An income of £10 or £20 was reckoned a competent estate for a gentleman—at least the lord of a single manor would seldom have enjoyed more. A knight who possessed £150 a-year passed for extremely rich. Sir John Fortescue speaks of five pounds a-year as "a fair living for a yeoman;" and we read that the same sum (£5) served as the annual expense of a scholar attending the university. Modern lawyers must be surprised at the following, which Mr Hallam extracts from the churchwarden's accounts of St Margaret, Westminster, for 1476:—"Also paid to Roger Fylpott, learned in the law, for his counsel giving 3s. 8d., *with fourpence for his dinner*."

It has been remarked, that the wages of day-labourers, particularly those engaged in agriculture, were better in the times of Edward III. and Henry VI. than they have ever been at any other period of English history; nor can it be denied that this, upon the whole, is true. In the fourteenth century, a harvest man had fourpence a-day, which enabled him in a week to buy a comb of wheat; but, says Sir John Cullum, in his History of Hawsted, to buy a comb of wheat, a man must now (1784) work ten or twelve days. "So," says Mr Hallam, "under Henry VI., if meat was at a farthing and a half the pound, which, I suppose, was about the mark, a labourer earning threepence a-day, or eighteenpence in the week, could buy a bushel of wheat, at six shillings the quarter, and twenty-four pounds of meat, for his family. A labourer at present earning twelve shillings a-week, can only buy a bushel of wheat at eighty shillings the quarter, and twelve pounds of meat at sevenpence." It is thus undeniable that the day-labourers' wages could purchase greater quantities of certain kinds of food than the wages given to the same class of persons could do in the present day, but they wanted a thousand comforts which the meanest of our workmen now enjoy; and few surely would be willing to exchange all these blessings for the wars and miseries which Edward caused, even although they were ensured, along with them, of daily supplies of beef and ale, of which the ancient yeomen boasted.

The internal accommodation of houses was even less than their outward splendour. A gentleman's house containing three or four beds was thought to be extraordinarily well provided; few probably had more than two. The walls were commonly bare, without wainscot or even plaster, except that some great houses were furnished with hangings, and t haps, hardly so soon as the reign of Edv Neither books nor pictures could find a plac dwellings as these. Some inventories of bearing dates in the fourteenth century, have served to our own day, and they are curious a ing. In Sir F. Eden's work on the State of a carpenter's stock is said to have been value year 1301, at a shilling! In an inventory of of "John Port, late the king's servant," who d 1524, we find that this gentleman's house had of a hall, parlour, buttery, and kitchen, with steads, two chambers, three garrets, and sor accommodations. From this it may be infe Mr Port was a rather important man in his very few individuals at that time could boas accommodation. His plate was valued at jewels at L.23; and his funeral expenses am L.73, 6s. 8d.

Of all the arts necessary to existence, per of agriculture was in the most miserable condi ing the middle ages. On a thousand spots of la we now behold subjected to a fruitful cultivati was nothing to be seen at that time but "tracts ground, stagnating with bog or darkened by nati where the wild-ox, the roe, the stag, and the scarcely learned the supremacy of man." W first efforts at improvement in agriculture greater part of Europe to the monks. They the sake of retirement, secluded regions, wl cultivated with the labour of their hands. Anglo-Saxon husbandry we may remark," Turner, "that Doom's-day Survey gives us s cation that the cultivation of the church l much superior to that of any other. They l less wood upon them, and their meadow v abundant and in more numerous distribution culture of arable land in general was very ir according to Sir John Cullum, a full averag an acre sown with wheat amounted only to al or ten bushels—a circumstance, the knowledg may save us any surprise at a calculation by appears that, in the thirteenth century, the annual rent of an acre of arable land was pence to a shilling. In the time of Edward dinary price of a quarter of wheat appears to about four shillings. A sheep was sold high ling, and an ox might be reckoned at ten In considering these statements, however, money values, it must be recollected by perso day, that the precious metals were depreciated sively in their value by every sovereign in Eu enabled themselves in this way to pay debts *ance*, while in reality they were cheating their cr that extent; and sums of small name in those every way equal in value to greater sums in

At this time wine was sold only in the she English apothecaries. Yet the progress of it was called, had already begun to excite serio The Parliament of Edward III. passed an act ing the use of gold and silver in apparel had not a hundred pounds a-year; and Char France ordained that none should presume to their guests with more than two dishes and a me It is almost unnecessary to add, that laws of were passed only with a view to persons in th ranks; for others they were not needed. Cont history has recorded nothing of the poorer cl their slaughter in war; but we are at little lo ceive, that domestic comforts must have been slender among them, when we know that neith nor looking-glasses could be found in the bedro nobility. Ages over which this sketch does n were required before the great mass of hum should become possessed of personal comfo political rights.

The bravery of Wallace and of others averted ...calamity for ever. *Wales was not so fortunate; Ireland had already become a conquered province.* The grandson of Edward I., named Edward III., proved himself as ambitious and as sagacious as his predecessor. His attention, however, was greatly diverted from the kingdom of Scotland to that of France, with which country he commenced a war that proved greater in duration and extent than any that had occurred in Europe since the fall of the Roman empire. The proposal of subduing so great a country as France, and seating himself upon the throne of it, seemed at first to be the proposal of a madman; but in less than twenty years Edward had so effectually dismembered the different provinces, alienating some of the nobility and overawing others, that his attaining the object of his desires seemed by that time no improbable nor distant reality. His son, known in history as Edward the Black Prince, named so from the colour of his armour, contributed much, by his presence and his valour, to the success of the English arms. In the battle of Cressy, fought in 1346, with numbers greatly on the side of France, and in that of Poictiers, fought ten years later, under similar circumstances, the English were completely victorious. John, King of France, was taken prisoner, and the conduct of young Edward to his fallen enemy was generous and delicate in the highest degree, so that the French prisoners are said to have been overcome by the display of such an elevation of mind on the part of their conqueror, and to have burst into tears. This refinement was the result of chivalry, which both the Edwards attached themselves to, and rendered respectable by their virtues.

France was at this time in a deplorable state. A foreign enemy in the heart of the kingdom, the king a prisoner, the capital in sedition, and civil war raging over and above all—these were some of her accumulated misfortunes; and as if nature meant to conspire with man for her destruction, a plague broke out at this time among the people, and consummated the work of famine and the sword. This plague, however, was not confined to France, though, from the dilapidated state of that country, it proved perhaps in it most disastrous. It invaded every kingdom of Europe, and the English historian, Hume, computes that it swept away about one-third of the inhabitants of every country that it attacked. The origin of the disease is not well known; but there can be no doubt that it could only have made the ravages which it did among nations uncivilised and ignorant, heedless of all the cleanliness and comforts which we know, in modern times, to be necessary to the preservation of health. According to the ordinary account, this pestilence took its rise in the Levant about the year 1346, from whence Italian traders brought it to Sicily, Pisa, and Genoa. In 1348, it passed the Alps, and spread over France and Spain. In the next year it reached Britain, where, in London alone, 50,000 persons are said to have become its victims; and in 1350, it laid waste Germany and other northern states, lasting generally in each country about five months. At Florence more than three out of every five of the inhabitants were swept away. It is well known to those acquainted with Italian literature, that the time of Boccaccio's Decameron is laid during this pestilence.

While the plague lasted, a temporary truce had been agreed upon between the French and English. At that time the balance of advantage was greatly in favour of the English. Not to mention less important gains, all Guienne, Gascony, Poitou, Saintonge, the Limousin, and the Angoumois, as well as Calais, and the county of Pointhieu, were ceded in full sovereignty to Edward, and the empty title of King of France was all that he became bound to give up (1360). But it was found impossible to retain possessions in the heart of a foreign country, though won by consummate bravery and ruled with no imprudence. In less than ten years (1368), the war was recommenced, and the English began to lose many of the provinces which they had previously acquired. Charles V., who had acted as regent in France during the captivity of his father John, and was now his successor on the throne, contributed greatly by his

Denmark. The remedy was found hardly any better than the disease. Having once acquired a footing in the island, these hardy strangers proceeded to make it a subject of conquest, as the Romans had done before, with this material difference, that they drove the British to the western parts of the island, particularly into Wales, and settled, with new hordes of their countrymen, over the better part of the land. So completely was the population changed, that, excepting in the names of some of the hills and rivers, the British language was extinguished, and even the name of the country itself was changed from what it originally was, to Angle-land, or England, a term taken from the Angles. The conquest required about a hundred and fifty years to be effected, and, like that of the Romans, it extended no farther north than the Firths of Forth and Clyde. Before the Britons were finally cooped up in Wales, many battles were fought; but few of these are accurately recorded. The most distinguished of the British generals were the Princes Vortimer and Aurelius Ambrosius: it is probably on the achievements of the latter that the well-known fables of Arthur and his knights are founded.

England, exclusive of the western regions, was now divided into seven kingdoms, called Kent, Northumberland, East Anglia, Mercia, Essex, Sussex, and Wessex, each of which was governed by a race descended from the leader who had first subdued it; and the whole have since been called by historians the *Saxon Heptarchy*, the latter word being composed of two Greek words, signifying *seven kingdoms*. To the north of the Forth dwelt a nation called the Picts, who also had a king, and were, in all probability, the people with whom Agricola had fought under the name of Caledonians. In the Western Highlands there was another nation, known by the name of the Scots, or Dalrinds, who had gradually migrated thither from Ireland, between the middle of the third century and the year 503, when they established, under a chief named Fergus, a monarchy destined in time to absorb all the rest. About the year 700, there were no fewer than fifteen kings, or chiefs, within the island, while Ireland was nearly in the same situation. In Britain, at the same time, five languages were in use, the Latin, Saxon, Welsh, (or British), the Pictish, and the Irish. The general power of the country has been found to increase as these nations and principalities were gradually amassed together.

Although three of the Saxon kingdoms, Wessex, Mercia, and Northumberland, became predominant, the Heptarchy prevailed from about the year 585 to 800, when Egbert, King of Wessex, acquired a paramount influence over all the other states, though their kings still continued to reign. Alfred, so celebrated for his virtues, was the grandson of Egbert, and began to reign in the year 871. At this time, the Danes, who are now a quiet, inoffensive people, were a nation of pirates, and at the same time heathens. They used to come in large fleets, and commit dreadful ravages on the shores of Britain. For some time, they completely overturned the sovereignty of Alfred, and compelled him to live in obscurity in the centre of a marsh. But he at length fell upon them, when they thought themselves in no danger, and regained the greater part of his kingdom. Alfred spent the rest of his life in literary study, of which he was very fond, and in forming laws and regulations for the good of his people. He was perhaps the most able, most virtuous, and most popular prince that ever reigned in Britain; and all this is the more surprising, when we find that his predecessors and successors, for many ages, were extremely cruel and ignorant. He died in the year 901, in the fifty-third year of his age.

CONQUEST BY THE NORMANS.

The Saxon line of princes continued to reign, with the exception of three Danish reigns, till the year 1066, when the crown was in the possession of a usurper named Harold. The country was then invaded by William, Duke of Normandy, a man of ille birth, attended by a large and powerful army. opposed him at Hastings (October 14), and, well-contested battle, his army was defeated, a self slain. William then caused himself to be king at Westminster; and in the course of a f he succeeded, by means of his warlike Nor lowers, in completely subduing the Saxons. H were settled upon the lands of those who oppo and became the ancestors of the present nc England.

Previously to this period, the church of Rom was the only surviving part of the power of t pire, had established its supremacy over Engla land was also subjected to what is called th system, by which all proprietors of land were s to hold it from the king for military service, wh tenants were understood to owe them military in turn, for their use of the land. All orders were thus kept in a chain of servile obedienc some of the lower orders were actually slaves superiors.

In the year 853, Kenneth, King of the Sc added the Pictish kingdom to his own, and scendant Malcolm II., in 1020, extended his do over not only the south of Scotland, but a par north of England. Thus, putting aside Wale continued to be an independent country, under princes, the island was divided at the time of t man Conquest, into two considerable kingdon land and Scotland, as they were for some c afterwards. Ireland, which had also been inv hordes from the north of Europe, was divide number of small kingdoms, like England under t tarchy.

EARLY NORMAN KINGS.

William, surnamed *The Conqueror*, reigne 1066 to 1087, being chiefly engaged all that completing the subjugation of the Saxons. He is to have been a man of much sagacity, and a firr but his temper was violent, and his disposition At the time of his death, which took place in Nor his eldest son Robert happening to be at a grea tance from London than William, who was the son, the latter individual seized upon the cr which he could not afterwards be dispossessed was shot accidentally by an arrow in the New in the year 1100. Towards the close of this reign, the whole of Christian Europe was agit the first crusade—an expedition for the recover Holy Land from the Saracens. Robert of No had a high command in this enterprise, and much fame as a warrior; but while he was i on his return, his youngest brother Henry usur throne left vacant by William, so that he wa disappointed of his birthright. HENRY I.—su *Beauclerk*, from his being a fine scholar—was a of some ability; but he disgraced himself by out the eyes of his eldest brother, and keepi nearly thirty years in confinement. Such ba conduct shows that, in this age, might was th right, and that men hesitated at no actions might promise to advance their own interests.

Contemporary with William the Conqueror i land, was MALCOLM III. in Scotland, surname *more*, from his having a large head. This after overthrowing the celebrated usurper M married Margaret, a fugitive Saxon princess, t whom his posterity became the heirs of that English sovereigns. He was a good prince, a settling Saxon refugees upon his lowland territo much to improve the character of the Scottish who are described as having been, before this t nation in which there was no admixture of civil At Malcolm's death, in 1093, the crown was co for a while by an usurper called Donald Bane, a elder sons of the late monarch, but finally fell peaceable possession of his youngest son DAVID

prince of much superior character, apparently, Norman sovereigns who lived in the same age. hurch of Rome having now gained an ascendancy eland, David founded a considerable number of teries and churches for the reception of the ers of that religion. All the most celebrated es in Scotland took their rise in his time.

ry Beauclerk of England, in order to strengthen aim by a Saxon alliance, married Maud, the ter of Malcolm Canmore and of the Princess aret. By her he had an only daughter of the name, whom he married first to the Emperor of ny, and then to Geoffrey Plantagenet, eldest son Earl of Anjou, in France. This lady, and her en by Plantagenet, were properly the heirs of the h crown; but on the death of Henry, in 1135, seized by an usurper named STEPHEN, a distant er of the Conqueror's family, who reigned for en years, during which the country was rendered : desolate by civil wars, in which David of Scot- ccasionally joined.

the death of Stephen, in 1154, the crown fell ully to HENRY II., who was the eldest son of , and the first of the Plantagenet race of sove- . Henry was an acute and politic prince, though any respect more amiable than his predecessors. ign was principally marked by a series of mea- for reducing the power of the Romish clergy, in urse of which, some of his courtiers, in 1171, ht they could not do him a better service than to r Thomas-à-Becket, Archbishop of Canterbury, ad been the chief obstacle to his views, and was the ablest and most ambitious men ever produced gland. For his concern in this foul transaction, had to perform a humiliating penance, receiving lashes on his bare back from the monks of Can- y. We are the less inclined to wonder at this stance, when we consider, that, about this time, pe had power to cause two kings to perform the l service of leading his horse.

ry was the most powerful king that had yet d in Britain. Besides the great hereditary do- which he possessed in France, and for which he mage to the king of that country, he exacted a rary homage from William of Scotland, the grand- David, a monarch of great valour, who took the me of *the Lion*, and who reigned from 1166 to

Henry also added Ireland to his dominions. land had previously been divided into five king- —Munster, Leinster, Meath, Ulster, and Con- t. The people, being quite uncivilised, were per- ly quarrelling among themselves; and this, with heathen religion, furnished a flimsy pretext for ing them from England. Dermot Macmorrough, f Leinster, having been dethroned by his subjects, ided an English warrior, Richard Earl of Strigul, ally called *Strongbow*, for the purpose of regaining ossessions. A body composed of fifty knights, y esquires, and four hundred and sixty archers, six hundred men, was enabled by its superior line to overthrow the whole warlike force that be brought against them; and the conquest was completed by Henry in person, who went thither 72. The military leaders were left to rule over untry, and they managed their trust so ill, that ish never became peaceable subjects of the Nor- king, as the English had gradually done.

RICHARD CŒUR DE LION.—JOHN.—MAGNA CHARTA.

ry II. was much troubled in his latter years by isobedience of his children. At his death, in 1189, s succeeded by his son RICHARD, styled *Cœur de* or the *Lion-hearted*, from his headstrong courage, ho was much liked by his subjects on that ac- , though it does not appear that he possessed any good qualities. At the coronation of Richard, ople were permitted to massacre many thousands tending Jews throughout the kingdom. Almost diately after his accession, he joined the King of France in a second crusade; landed in Palestine (1191), and fought with prodigious valour, but with no good result. On one occasion, being offended at a breach of truce by his opponent Saladin, he beheaded 5000 prisoners; whose deaths were immediately revenged by a similar massacre of Christian prisoners. In 1192, he returned with a small remnant of his gallant army, and, being shipwrecked at Aquileia, wandered in disguise into the dominions of his mortal enemy the Duke of Austria, who, with the Emperor of Germany, detained him till he was redeemed by a ransom, which impoverished nearly the whole of his subjects. This prince spent the rest of his life in unavailing wars with Philip of France, and was killed at the siege of a castle in Limousin, in 1199, after a reign of ten years, of which he had spent only about three months in England.

JOHN, the younger brother of Richard, succeeded, although Arthur, Duke of Bretagne, the son of an intermediate brother, was the proper heir. John, who was at once vain, cruel, and weak, alienated the affections of his subjects almost at the very first by the assassination of his nephew, which he is said to have performed with his own hands. The weakness of kings is often the means of giving increased liberties and privileges to the people. The paltry tyranny and wickedness of John caused his barons to rise against him, and the result was, that, on the 19th June 1215, he was compelled by them to sign what is called the *Magna Charta*, or Great Charter, granting them many privileges and exemptions, and generally securing the personal liberty of his subjects. The principal point concerning the nation at large, was that no tax or supply should be levied from them without their own consent in a Great Council—the first idea of a Parliament. Some excellent provisions were also made regarding courts of law and justice, so as to secure all but the guilty.

The Pope, it appears, regarded the Magna Charta as a shameful violation of the royal prerogative, and excommunicated its authors, as being worse, he said, than infidels. The opinion of a modern historian is very different. He says, "To have produced the Great Charter, to have preserved it, to have matured it, constitute the immortal claim of England on the esteem of mankind."

HENRY III.—ORIGIN OF PARLIAMENT.

John, at his death in 1216, was succeeded by his son, HENRY III., a weak and worthless prince, who ascended the throne in his boyhood, and reigned fifty-six years, without having performed one worthy act of sufficient consequence to be detailed. In his reign was held the first assemblage approaching to the character of a Parliament. It was first called in 1225, in order to give supplies for carrying on a war against France. The money was only granted on condition that the Great Charter should be confirmed; and thus the example was set at the very first, for rendering supplies a check upon the prerogative of the king, and gradually reducing that power to its present comparatively moderate level. Under the earlier Norman kings, and even, it is believed, under the Saxons, an assembly called the Great Council had shared with the sovereign the power of framing laws; but it was only now that the body had any power to balance that of the king, and it was not till 1265 that representatives from the inhabitants of towns were introduced.

EDWARD I. AND II.—ATTEMPTED CONQUEST OF SCOTLAND.

Henry III., at his death in 1272, was succeeded by his son EDWARD I., a prince as warlike and sagacious as his father was the reverse. He distinguished himself by his attempts to add Wales to his kingdom, an object which he accomplished in 1282, by the overthrow and murder of Llewellen, the last prince of that country. In the mean time, from the death of William the Lion in 1214, Scotland had been ruled by two princes, ALEXANDER II. and III., under whom it advanced considerably in wealth, civilisation, and comfort. On the death of Alexander III., in 1285, the crown fell to his grand-

daughter MARGARET, a young girl, whose father was Eric, King of Norway. Edward formed a treaty with the Estates of Scotland for a marriage between this princess and his son, whom he styled Prince of Wales. Unfortunately, the young lady died on her voyage to Scotland; and the crown was left to be disputed by a multitude of distant relations, of whom JOHN BALIOL and ROBERT BRUCE seemed to have the best right. Edward, being resolved to make Scotland his own at all hazards, interfered in this dispute, and being appointed arbitrator among the competitors, persuaded them to own, in the first place, an ill-defined claim put forward by himself of the right of paramountcy or superior sovereignty over Scotland. When this was done, he appointed Baliol to be his vassal king, an honour which the unfortunate man was not long permitted to enjoy. Having driven Baliol to resistance, he invaded the country, overthrew his army, and, stripping him of his sovereignty, assumed to himself the dominion of Scotland, as a right forfeited to him by the rebellion of his vassal. After he had retired, a brave Scottish gentleman, named William Wallace, raised an insurrection against his officers, and, defeating his army at Stirling in 1298, cleared the whole country of its southern invaders. But in the succeeding year, this noble patriot was defeated by Edward in person at Falkirk, and the English yoke was again imposed. It is to be remarked, that this could have hardly taken place if the common people, who rose with Wallace, and who were wholly of Celtic and Saxon race, had been led and encouraged by the nobility. The grandees of Scotland, and even the competitors for the crown, being recent Norman settlers, were disposed to pay obedience to the English sovereign.

Some time after the death of Wallace, while Edward was engrossed with his French wars, ROBERT BRUCE, Earl of Carrick, grandson of him who had competed with Baliol, conceived the idea of putting himself at the head of the Scots, and endeavouring, by their means, at once to gain the crown, and to recover the independence of the kingdom. After a series of adventures, among which was the unpremeditated murder of a rival named Comyn, Bruce caused himself, in 1306, to be crowned at Scone. For some time after he had to skulk as a fugitive, being unable to maintain his ground against the English officers; but at length he became so formidable, that Edward found it necessary (1307) to lead a large army against him. The English monarch, worn out with fatigue and age, died on the coast of the Solway Firth, when just within sight of Scotland, leaving his sceptre to his son EDWARD II. That weak and foolish prince immediately returned to London, leaving Bruce to contest with his inferior officers.

After several years of constant skirmishing, during which the Scottish king was able to maintain his ground, Edward resolved to make one decisive effort to reduce Scotland to subjection. In the summer 1314, he invaded it with an army of 100,000 men. Bruce drew up his troops, which were only 30,000 in number, at Bannockburn, near Stirling. Partly by steady valour, and partly by the use of stratagems, the Scots were victorious, and Edward fled ignominiously from the field. The Scottish king gained an immense booty, besides securing his crown and the independence of his country. He soon after sent his brother Edward, with a body of troops, to Ireland, to assist the native chiefs in resisting the English. This bold young knight was crowned king of Ireland, and for some time held his ground against the English, but was at length defeated and slain.

The weakness of Edward II. was chiefly shown in a fondness for favourites, into whose hands he committed the whole interests of his people. The first was a low Frenchman, named Piers Gaveston, who soon fell a victim to the indignation of the barons. The second, Hugh Spencer, misgoverned the country for several years, till at length the Queen and Prince of Wales raised an insurrection against the king, and caused him to be deposed, as quite unfit to reign. The Prince was then crowned as EDWARD III. (1327), being a about fourteen years of age; and, in the course months the degraded monarch was cruelly m in Berkeley Castle.

During the minority of the young king, the government were held by his mother and th March. Under their administration, a peace cluded with King Robert of Scotland, of whic the conditions was a full acknowledgment of t pendence of the Scottish monarchy, which ha matter of dispute for some ages.

EDWARD III.—RICHARD II.

Edward III., who soon after assumed full po destined to make good the remark prevalen time, that the kings of England were alterna and imbecile. He was a warlike and sagacious and inspired by all his grandfather's desire of In 1329, Robert Bruce died, and was succeed infant son DAVID II., to whom a young siste English king was married, in terms of the la Notwithstanding this connexion, Edward aided John Baliol in an attempt to gain the Scottis Edward Baliol overthrew the Regent of Sc Duplin, September 1332, and for two months as King of Scots, while David and his wife to in France. Though now expelled, Baliol af returned to renew his claims, and for many y country was harassed by unceasing wars, in w English took a leading part.

But for his attention being diverted to Fra ward III. would have made a more formidab to subdue Scotland, and might have succeed was led into a long course of warfare with Fr consequence of an absurd pretension which he its crown. In the victories which he gained a (August 26, 1346) and Poitiers (September 1 the national valour, his own, and that of his co son, the Black Prince, were shown conspicuou this lavish expenditure of the resources of his k in which he was supported by his parliament no permanent benefit, even to himself, for who it was made. In those days, almost all men well, but very few had the art to improve th tories. John, King of France, who had bee captive at Poitiers, and David, King of Scotla had been taken in 1346, while conducting an inv England, were at one time prisoners in Engla no permanent advantage was ever gained over the states thus deprived of their sovereigns. after about twenty years of active fighting, the king left France with little more territory than previously enjoyed. Edward had invaded S with a powerful army in 1356, but without mak impression. The Scots, under David's nephew, Stewart, effectually protected themselves, not on his arms, but from a proposal which David basely undertook to make, that Lionel, the thir the English king, should be acknowledged as cessor. Edward died in 1377, a year after the of his son the Black Prince; and notwithstan their brilliant exploits, the English territories in were less than at the beginning of the reign.

England was at this time affected more than other by the fashions of chivalry. This was a enthusiasm, which for some centuries pervad Christian Europe. It prompted, as one of principles, a heedless bravery in encountering a of danger. Its votaries were expected to be part bold in behalf of the fair sex, insomuch that a knight would sometimes challenge to mortal any one who denied his mistress to be the lov the world. Tournaments were held, at which clad in complete armour would ride against eac at full speed with levelled lances, merely to tr had the greatest strength and skill; and man killed on these occasions. It was a system full travagance, and tending to bloodshed; but, ne less, it maintained a courtesy towards females

e principle of honour, which we may be glad to considering how rude was almost every other of the age.

rd III. was succeeded by his grandson, RICHARD a boy of eleven years of age, and who proved person of weak and profligate character. The ns took advantage of the irregularity of his go- nt to strengthen their privileges, which they h difficulty sustained during the more powerful his predecessor. Early in this reign they d the right, not only of taxing the country, but ıg how the money was spent. Indignant at the r of a tax imposed upon all grown-up persons, ıantry of the eastern parts of England rose, in ınder a person of their own order, named Wat and advanced, to the number of 60,000, to Lon- ere they put to death the chancellor and primate, counsellors of their sovereign. They demanded olition of bondage, the liberty of buying and in fairs and markets, a general pardon, and duction of the rent of land to an equal rate. ing came to confer with them at Smithfield, , on some slight pretence, Walworth, mayor of n, stabbed Wat Tyler with a dagger—a weapon has since figured in the armorial bearings of tropolis. The peasants were dismayed, and ted, and no fewer than fifteen hundred of them hanged. Wat Tyler's insurrection certainly pro- d upon a glimmering sense of those equal rights nkind which have since been generally acknow- d; and it is remarkable, that at the same time the nes of the reformer Wickliffe were first heard of. learned ecclesiastic wrote against the power of the , and some of the most important points of the ish faith, and also executed a translation of the into English. His writings are acknowledged to been of material, though not immediate effect, in ing about the reformation of religion.

e country was misgoverned by Richard II. till when he was deposed by his subjects under the g of his cousin, Henry Duke of Lancaster. This n, though some nearer the throne were alive, was ed as HENRY IV., and his predecessor, Richard, on after murdered. In the mean time, David of ed died in 1371, and was succeeded by Robert rt, who was the first monarch of that family. rt I., dying in 1389, was succeeded by his son Robert ho was a good and gentle prince. He had two sons, l and James: the former was starved to death by ıde, the Duke of Albany; and the second, when ı way to France for his education, was seized by r IV. of England, and kept captive in that country ghteen years. Robert II. then died of a broken (1406), and the kingdom fell into the hands of ke of Albany, at whose death, in 1419, it was ed by his son Duke Murdoch, a very imbecile ıge.

HOUSE OF LANCASTER.

ry IV. proved a prudent prince, and compara- a good ruler. The settlement of the crown upon r parliament was a good precedent, though, per- ıaps dictated under the influence of his successful He was much troubled by insurrections, parti- ·a formidable one by Percy, Earl of Northum- l—and one still more difficult to put down, in where Owen Glendower, a descendant of the princes, kept his ground for several years.

ıe death of Henry IV. in 1413, he was succeeded son, who was proclaimed under the title of V. The young king attained high popularity, ınt of his impartial administration of justice, ı zeal to protect the poor from the oppressions superiors. His reign is less agreeably marked persecutions of the Lollards, a body of religious ırs, many of whom were condemned to the Being determined to use every endeavour to ı crown of France, which he considered his by birth, he landed in Normandy with 30,000 men (August 1415), and gave battle to a much superior force of the French at Agincourt. He gained a complete victory, which was sullied by his afterwards ordering a massacre of his prisoners, under the apprehension that an attempt was to be made to rescue them. The war was carried on for some years longer, and Henry would have probably succeeded in making good his claim to the French crown, if he had not died prematurely of a dysentery (August 31, 1422), in the thirty-fourth year of his age, leaving the throne to an infant nine months old, who was proclaimed as HENRY VI., King of France and England.

Under Henry VI., whose power was for some time in the hands of his uncle the Duke of Bedford, the English maintained their footing in France for several years, and at the battle of Verneuil, in 1424, rivalled the glory of Cressy and Poitiers. At that conflict, a body of Scotch, 7000 strong, who had proved of material service to the French, were nearly cut off. In 1428, when France seemed completely sunk beneath the English rule, the interests of the native prince were suddenly revived by a simple maiden, named Joan of Arc, who pretended to have been commissioned by Heaven to save her country, and, entering into the French army, was the cause of several signal reverses to the English. By her enthusiastic exertions, and the trust every where reposed in her supernatural character, Charles VII. was crowned at Rheims, in 1430. Being soon after taken prisoner, the heroic maiden was, by the English, condemned for witchcraft, and burnt. Nevertheless, about the year 1453, the French monarch had retrieved the whole of his dominions from the English, except Calais.

Henry VI. was remarkable for the extreme weakness of his character. His cousin, Richard, Duke of York, descended from an elder son of Edward III., and therefore possessed of a superior title to the throne, conceived that Henry's imbecility afforded a good opportunity for asserting what he thought his birthright. Thus commenced the famous *Wars of the Roses*, as they were called, from the badges of the families of York and Lancaster, the former of which was a red, while the latter was a white rose. In 1454, the duke gained a decisive victory over the forces of Henry, which were led by his spirited consort, Margaret of Anjou. In some succeeding engagements, the friends of Henry were victorious; and at length, in the battle of Wakefield (December 24, 1460), the forces of the Duke of York were signally defeated, and himself, with one of his sons, taken and put to death. His pretensions were then taken up by his eldest son Edward, who, with the assistance of the Earl of Warwick, gained such advantages next year, that he assumed the crown. Before this was accomplished, many thousands had fallen on both sides. Henry, who cared little for the pomp of sovereignty, was confined in the Tower.

Scotland, in the mean time (1424), had redeemed her king from his captivity in England; and that prince, styled JAMES I., had proved a great legislator and reformer, not to speak of his personal accomplishments in music and literature, which surpassed those of every contemporary monarch. James did much to reduce the Highlands to an obedience under the Scottish government, and also to break up the enormous power of the nobles. By these proceedings, however, he excited a deep hatred in the bosoms of some of his subjects; and, in 1437, he fell a victim to assassination at Perth. He was succeeded by his infant son JAMES II., the greater part of whose reign was spent in a harassing contention with the powerful house of Douglas, and who was finally killed in the flower of his age, by the bursting of a cannon before Roxburgh Castle. His successor, James III., was also a minor, and, on reaching man's estate, proved to be a weak though not ill-meaning prince. He fell a victim, in 1488, to a conspiracy formed by his subjects, and which was led by his eldest son. The morality of princes in this age seems to have been much upon a par with that ascribed to the Turkish sovereigns of a later period. They never

scrupled to destroy life, either within the circle of their own family, or out of it, when it suited their interests to do so.

HOUSE OF YORK.

Edward, of the House of York, styled EDWARD IV., who commenced his reign in the nineteenth year of his age, reigned ten years, perpetually disturbed by renewed attempts of the Lancastrian party, of which he mercilessly sacrificed many thousands who fell into his hands. At length, having offended the Earl of Warwick, who had been chiefly instrumental in placing him upon the throne, that powerful nobleman raised an insurrection against him, and in eleven days was master of the kingdom, while Edward had to take refuge on the Continent. Henry VI. was then restored, and Warwick acquired the title of King-maker. Nine months after (1471), Edward landed with a small body of followers, and, having called his partisans around him, overthrew and killed Warwick at St Alban's. Margaret of Anjou, who had fought battles for her husband in almost every province of England, gathered a new army, and opposed Edward at Tewkesbury Park, where she was completely defeated. Her son and husband, being taken, were murdered in cold blood, and she herself spent the remainder of her singular life in France. Edward reigned, a profligate and a tyrant, till 1483, when he died in the forty-second year of his age. He had previously caused his brother, the equally profligate Duke of Clarence, to be drowned in a butt of malmsey wine.

During the reign of Edward IV., the plague frequently broke out in England, and carried off immense numbers of the people. It was particularly fatal in London, and in all other places where many houses were huddled closely together, with imperfect means of cleaning and ventilation. It was calculated that the disease, on one occasion in this reign, destroyed as many lives as the fifteen years' war. The plague did not cease to occur in England, or in any other European country, until considerable improvements had taken place in the habits of the people, especially in point of cleanliness.

EDWARD V., the eldest son of Edward IV., was a boy of eleven years when he succeeded to the crown. His uncle, Richard, Duke of Gloucester, a wicked and deformed wretch, soon after contrived to obtain the chief power, and also to cause the murder of the young king and his still younger brother in the Tower. He then mounted the throne under the title of RICHARD III. For two years, this disgrace to humanity continued to reign, though universally abhorred by his people. At length, in 1485, Henry Tudor, Earl of Richmond, a connexion rather than a descendant of the Lancaster family, resolved to make an attempt upon the English crown. Having landed with about 2000 followers at Milford Haven, he advanced into the country, and speedily gained such accessions of force as enabled him to meet and overthrow Richard at Bosworth Field, where the tyrant was slain, and the victorious Richmond was immediately proclaimed king, under the title of HENRY VII. The new monarch soon after sought to strengthen his title by marrying Elizabeth, the daughter and heir of Edward IV., by which it was said the families of York and Lancaster were united.

HOUSE OF TUDOR.—HENRY VII.

Under Henry VII. the country revived from the evils of a long civil war, in the course of which the chief nobility had been broken down, and the industry and commerce of the land interrupted. It was remarkable, nevertheless, that, during the past period, England was upon the whole an improving country. The evils of war had fallen chiefly on those who made it; the government, however disturbed by various claimants of the throne, was mild and equitable—at least as compared with that of other countries; and the people throve under a system in which their own consent, by the voice of the House of Commons, was necessary to the making of every new law, and the laying on of every tax.

The reign of Henry VII. was much distu insurrections, in consequence of his imperfect t baker's boy, named Lambert Symnel, and a Je named Perkin Warbeck, were successively set the York party, the one as a son of the late D Clarence, and the other as the younger bro Edward V., but were both defeated. Warbe hanged at Tyburn in 1499, and nearly about th time, Henry procured, by forms of law, the d the Earl of Warwick, the real son of the late D Clarence, a poor idiot boy, whom he had kept years in confinement, and whose title to the being superior to his own, rendered him uneas

Henry, though a cruel prince, as were most sovereigns of his age, was a sagacious and p ruler. He paid great attention to all his affai in some of his acts, looked far beyond the prese For example, by marrying his daughter Marg James IV. of Scotland, he provided for the po of the future union of the two crowns. By a law ing men of property to break entails, he ensu reduction of the great lords, and the increase number of small proprietors. His constant pol to depress the chief nobles, and to elevate the lawyers, and men of new families, as most likel dependent on him. The greatest fault of his ch was his excessive love of money, of which he a an immense sum. During his reign, Ireland wa more dependent on the English crown by a prohibiting any parliament from being held in the king should give his consent.

HENRY VIII.

Henry VII. died in April 1509, in the fift year of his age. His eldest surviving son and suc HENRY VIII., was now in his eighteenth year. handsome, and supposed to be amiable, he enjo first a high degree of popularity. Some years he had been affianced to Catherine, a Spanish pr who had previously been the wife of his de brother Arthur: he was now married to this la Pope having previously granted a dispensation f purpose. For many years the reign of Henry v marked by any unusual incidents. The chief a stration of affairs was committed to a low-bo proud churchman, the celebrated Cardinal W The king became much engaged in continental p and during a war which he carried on against h his brother-in-law James IV., who sided with tha made an unfortunate irruption into the north o land, and was overthrown and slain, with the g part of his nobility (September 9, 1513), at Flod

About this time some changes of great impo to European society took place. Almost ever sin destruction of the Roman empire, the nations arose out of it had remained in subjection to the see, which might be said to have inherited the un sway of that government, but altered from an au over the bodies of men to an empire over their In the opinion of many, this authority of the R Catholic religion had, in the course of time, b much abused, while the religion itself was corru many superstitious observances. So long as m continued to be the thoughtless warriors and unl peasants which they had been in the middle age not probable that they would ever have called in tion either the authority of the pope or the pu the Catholic faith. But, with knowledge, and th of a commercial and manufacturing class, came position to inquire into the authority of this gre gious empire. The art of printing, discovered the middle of the preceding century, and whic now rendering literature accessible to most cla the community, tended greatly to bring about th volution in European intellect. The minds of indeed, seem at this time as if awaking from a sleep; and it might well have been a question persons who had reflection, but no experience, wh the change was to turn to evil or to good.

hen men's minds are in a state of preparation for reat change, a very small matter is required to hem in motion. At Wirtemberg, in Germany, was an Augustine monk, named Martin Luther, became incensed at the Roman see, in consequence ne injury which he conceived to have been done order, by the Pope having granted the privilege ing indulgences to the Dominican order of friars. a man of a bold and inquiring mind, he did not atisfied till he had convinced himself, and many around him, that the indulgences were sinful, hat the Pope had no right to grant them. This ned about the year 1517. Controversy and per- on gradually extended the views of Luther, till length openly disavowed the authority of the and condemned some of the most important pe- ities of the Catholic system of worship. In these dings, Luther was countenanced by some of the in Germany, and his doctrines were speedily ished in the northern countries of Europe.

THE REFORMATION.

ry VIII., as the second son of his father, had riginally educated for the church, and still re- a taste for theological learning. He now distin- d himself by writing a book against the Lutheran es; and the Pope was so much pleased with it as st him the title of *Defender of the Faith*. Henry s destined, however, to continue long an adherent Roman pontiff. In the year 1527, he became ured of a young gentlewoman named Anne Bo- ho was one of his wife's attendants. He imme- conceived the design of annulling his marriage atherine, and marrying this younger and more ble person. Finding a pretext for such an act previous marriage of Catherine to his brother, mpted to obtain from the Pope a decree, declar- own marriage unlawful, and that the dispensation hich it had proceeded was beyond the powers former Pope to grant. The Pontiff (Clement was much perplexed by this request of King , because he could not accede to it without offend- arles V., Emperor of Germany, one of his best ters, and the brother of Queen Catherine, and ame time humbling the professed powers of the , which were now trembling under the attacks ber.

ry desired to employ the influence of his minister, al Wolsey, who had now reached a degree of ce and pride never before attained by a subject land. But Wolsey, with all his greatness, could sture to urge a matter disagreeable to the Pope, s more his master than King Henry. The pro- nt on for several years, and still his passion for Boleyn continued unabated. Wolsey at length ler the king's displeasure for refusing to serve this object, was stripped of all his places of nd wealth, and, in November 1530, expired at er Abbey, declaring that, if he had served his diligently as his king, he would not thus have ven over in his grey hairs. The uncontrollable f the king to possess Anne Boleyn, was destined e immediate cause of one of the most important that ever took place in England—no less than reformation of the national religion. In order l his marriage with Catherine, and enable him y Anne Boleyn, he found it necessary to shake authority of the Pope, and procure himself to owledged in Parliament as the supreme head English church. His marriage with Anne took 1533, and in the same year was born his cele- laughter Elizabeth.

536, Henry became as anxious to put away Anne as he had ever been to rid himself of Catherine. He had contracted a passion for ymour, a young lady then of the queen's bed- r, as Anne herself had been in that of Catherine. r to gratify this new passion, he accused Anne appears to have been an imaginary frailty, and within a month from the time when she had been an honoured queen, she was beheaded (May 19) in the Tower. On the very next day he married Jane Seymour, who soon after died in giving birth to a son (afterwards Edward VI.) His daughters, Mary and Elizabeth, were declared illegitimate by act of Parliament, and therefore excluded from the succession.

Hitherto, though professing independence of Rome, Henry still maintained, and even enforced, by severe and bloody laws, the most of its doctrines. He now took measures for altering this system of worship to something nearer the Lutheran model, and also for suppressing the numerous monasteries throughout the country. Being possessed of more despotic power, and, what is stranger still, of more popularity, than any former sovereign of England, he was able to encounter the dreadful risk of offending, by these means, a vastly powerful corporation, which seems, moreover, to have been regarded with much sincere affection and respect in many parts of England. No fewer than 645 monasteries, 2374 chanteries and chapels, 90 colleges, and 110 hospitals, enjoying altogether a revenue of £161,000, were broken up by this powerful and unscrupulous monarch. He partly seized the revenues for his own use, and partly gave them away to the persons who most actively assisted him, and who seemed most able to protect his government from the effects of such a sweeping reform. By this act, which took place in 1537, the Reformation was completed in England. Yet for many years Henry vacillated so much in his opinions, and enforced these with such severe enactments, that many persons of both religions were burnt as heretics. It was in the southern and eastern parts of England, where the commercial classes at this time chiefly resided, that the doctrines of the Reformation were most prevalent. In the western and northern parts of the country, Catholicism continued to flourish; and in Ireland, which was remotest of all from the Continent, the Protestant faith made little or no impression.

After the death of Jane Seymour, Henry married Anne of Cleves, a German princess, with whose person, however, he was not pleased; and he therefore divorced her by an act of Parliament. He next married Catherine Howard, niece to the Duke of Norfolk; but had not been long united to her when he discovered that she had committed a serious indiscretion before marriage. This was considered a sufficient reason for beheading the unfortunate queen, and attainting all her relations. Though Henry had thus murdered two wives, and divorced other two, and become, moreover, a monster in form as well as in his passions and mind, he succeeded in obtaining for his sixth wife (1543) Catherine Parr, widow of Lord Latimer, who, it is certain, only contrived to escape destruction by her extraordinary prudence. Almost all who ever served Henry VIII. as ministers, either to his authority or to his pleasures, were destroyed by him. Wolsey was either driven to suicide, or died of a broken heart; Thomas Cromwell, who succeeded that minister, and chiefly aided the king in bringing about the Reformation—Sir Thomas More, lord chancellor, the most virtuous, most able, and most consistent man of his time—the Earl of Surrey, who was one of the most accomplished knights of the age, and the first poet who wrote the English language with perfect taste—all suffered the same fate with Anne Boleyn and Catherine Howard.

When James IV. died at Flodden, in 1513, the Scottish crown fell to his infant son JAMES V., who struggled through a turbulent minority, and was now a gay, and, upon the whole, an amiable prince. His uncle, Henry VIII., endeavoured to bring him into his views respecting religion; but James, who was much in the power of the Catholic clergy, appears to have wished to become the head of the Popish party in England, in the hope of succeeding, by their means, to the throne of that country. A war latterly broke out between the two monarchs, and the Scottish army having refused to fight, from a dislike to the expedition, James died (December 1542) of a broken heart, leaving an only

child, MARY, who was not above a week old. Henry immediately conceived the idea of marrying his son Edward to this infant queen, by which he calculated that two hostile nations should be united under one sovereignty, and the Protestant Church in England be supported by a similar establishment in Scotland. This project, however, was resisted by the Scots, of whom very few as yet were inclined to the Protestant doctrines. Henry, enraged at their hesitation, sent a fleet and army, in 1544, to inflict vengeance upon them. The Scots endured with great patience the burning of their capital city, and many other devastations, but still refused the match. The government of Scotland was now chiefly in the hands of Cardinal Beaton, a man of bold and decisive intellect, who zealously applied himself to suppress the reforming preachers, and regarded the English match as likely to bring about the destruction of his religion.

EDWARD VI.—QUEEN MARY.

Henry died, January 28, 1547, leaving the throne to his only son, a boy of ten years of age, who was immediately proclaimed king under the title of EDWARD VI. The Duke of Somerset, maternal uncle to the young king, became supreme ruler under the title of Protector, and continued to maintain the Protestant doctrines. Under this reign, the church of England assumed its present form, and the Book of Common Prayer was composed nearly as it now exists. Somerset being resolved to effect, if possible, the match between Edward VI. and Mary of Scotland, invaded that country in autumn 1547, and was met at Musselburgh by a large army under the governor, the Earl of Arran. Though the Scotch were animated by bitter animosity against the English, against their religion, and against the object of their expedition, they did not fight with their usual resolution, but were defeated, and pursued with great slaughter. Finding them still obstinate in refusing to give up their queen, Somerset laid waste a great part of the country, and then retired. Previous to this period, Cardinal Beaton had been assassinated by private enemies; but the Scotch were encouraged to persevere by the court of France, to which they now sent the young queen for protection.

In the reign of Edward VI. the government was conducted mildly, until the Protector Somerset was degraded from his authority by the rising influence of Dudley, Duke of Northumberland, who caused him soon after to be tried and executed. Northumberland, who was secretly a Roman Catholic, was not so mild or popular a ruler. Yet, throughout the whole reign of Edward VI., which was terminated by his death on the 6th of July 1553, at the early age of sixteen, no religious party was persecuted, except those who denied the fundamental doctrines of the Christian religion. It would have been well for the honour of a church which has produced many great men, and to which the modern world is indebted for the very existence of Christianity, if it had not been tempted after this period to commence a very different course of action. The crown now belonged by birthright to Mary, the eldest daughter of Henry VIII., who was a zealous Catholic. Northumberland, however, assuming the illegitimacy of that princess and her sister Elizabeth, set up as queen the Lady Jane Grey, who was descended from a younger sister of King Henry, and who had been married to a son of the Duke of Northumberland. Lady Jane was the most beautiful, most intelligent, and most amiable of all the females who appear in the history of England. Though only seventeen, she was deeply learned, and yet preserved all the unaffected graces of character proper to her interesting age. Unfortunately, her father-in-law Northumberland was so much disliked, that the Catholics were enabled to displace her from the throne in eight days, and to set up in her stead the Princess Mary. Northumberland, Lady Jane, and her husband, Guildford Lord Dudley, were all beheaded by that savage princess, who soon after took steps for restoring the Catholic religion, and married Philip II., King of Spain, in order to strengthen herself against the Protestant interest. Mary experienced some resist from her Protestant subjects, and being under g suspicion of her sister Elizabeth, who professed the formed faith, but took no part against her, was al on the point of ordering her to execution also. As as she had replaced the Catholic system, and found self in possession of sufficient power, she began career of persecution which has rendered her nam infamous. Five out of fourteen Protestant bishops cluding the revered names of Cranmer, Latimer, Ridley, were committed to the flames as heretics; during the ensuing part of her reign, which was cl by her death, November 17, 1558, nearly three l dred persons suffered in the same manner. These se did not take place without exciting horror in the m of Englishmen in general, including even many Ca lics; but the royal authority was at all times too g under this line of princes to allow of effectual resista Such a persecution, however, naturally fixed in minds of the British Protestants a hereditary ho for the name of Catholic, which has in its turn l productive of many retaliatory persecutions al equally to be lamented. In the latter part of her r she was drawn by her husband into a war with Fra of which the only effect was the loss of Calais, the of the French possessions of the sovereigns of Engl The natural sourness of Mary's temper was incre by this disgraceful event, as well as by her wan children, and she died in a state of great unhappin

ELIZABETH.—MARY, QUEEN OF SCOTS.—REFORMATI IN SCOTLAND.

A more auspicious scene opened for England in accession of ELIZABETH, a princess of great native vi of mind, and who had been much improved by ad sity, having been kept in prison during the whole r of her sister. From the peculiar circumstances of E beth's birth, her right of succession was denied b the Catholics at home and abroad. This party sidered Mary, Queen of Scots, who was descended the eldest sister of Henry VIII., and had been bro up in the Catholic faith at the court of France, as legitimate sovereign. Elizabeth had no support in quarter, except among her Protestant subjects. Pope issued a bull, which, directly or indirectly, nounced her an usurper, and gave permission to subjects to remove her from the throne. The cou France professed to consider the Queen of Scots, had recently been married to the Dauphin, as Queen of England. Under these circumstances, E beth found no chance of safety except in restoring maintaining the Protestant religion in her own coun and in seeking to support it in all others where people were favourable to it. The Scottish nation be now engaged in a struggle with their regent, Mary Guise, in behalf of Protestantism, Elizabeth gladly ceded to a proposal made by the nobles of that coun and sent a party of troops, by whose assistance the formed religion was established (1560). In bring about this change, the chief native leaders were Jam Stewart, a natural son of King James V., and Jo Knox, who had once been a friar, but was now a P testant preacher. As a natural consequence of the ligation which the English queen had conferred u the Scottish reformers, she acquired an influence o the country which was never altogether lost.

About the time when the Scottish Parliament establishing the reformed religion, Mary of Gu breathed her last, leaving the country to be mana by the reforming nobles. Her daughter, the Queen Scots, now eighteen years of age, and the most bea ful woman of her time, had in 1559 become the qu consort of France; but, in consequence of the death her husband, she was next year left without any p tical interest in that country. She accordingly, August 1561, returned to Scotland, and assumed sovereignty of a country which was chiefly under rule of fierce nobles, and where the people, from

ice of their religious faith, as well as their native
nn, were little fitted to yield her the obedience
subjects.

REFORMATION IN SCOTLAND.

change of religion in Scotland was of a more
e kind than it had been in England. The Eng-
formation had been effected by sovereigns, who,
they wished to throw off the supremacy of the
and some of the Catholic rites, desired to give
e way as possible to popular principles. They
re not only seized the supremacy of the church
mselves, but, by bishops and other dignitaries,
t an efficient instrument for supporting monarchi-
rnment. In Scotland, where the Reformation
fected by the nobles and the people, at a time
still bolder principles had sprung up, none of this
nary of power was retained; the clergy were
l on a footing of perfect equality; they were all
n engaged in parochial duties, and only a small
f the ancient ecclesiastical revenues was allowed
m. In imitation of the system established at
a, their general affairs, instead of being intrusted
hands of bishops, were confided to courts formed
mselves. These courts, being partly formed by
ders, kept up a sympathy and attachment among
mmunity, which has never existed in so great a
e in the English church. What was of perhaps
greater importance, while a large part of the an-
revenues was absorbed by the nobles, a very con-
able portion was devoted to the maintenance of
h schools, under the express control of the clergy.
e at once formed regular nurseries of Protestant
tians, and disseminated the elements of learning
extensively over this small and remote country
it had ever been over any other part of the world.

MARY, QUEEN OF SCOTS.

een Mary, having little power in her own country,
obliged to govern by means of her natural brother,
es Stewart, whom she created Earl of Moray, and
was the leader of the Protestant interest in Scot-
l. Personally, however, she was intimately connected
the great Catholic powers of the Continent, and be-
a party, in 1564, to a coalition formed by them for
suppression of Protestantism all over Europe. She
never yet resigned her pretensions to the English
ne, but lived in the hope, that, when the Catholics
ded in every where subduing the Protestants, she
ld attain that object. Elizabeth, who had only the
rt of the Protestant part of her own subjects, with
ndly feeling among the Scotch and other unimpor-
Protestant nations, had great reason to dread the
deracy formed against her. She nevertheless
d firm upon the Protestant faith, and the principles
mparatively liberal and popular government, as
only safe position.

series of unfortunate events threw Mary into the
ds of Elizabeth. The former queen, in 1565, married
cousin Lord Darnley, and by that means alienated
affections of her brother and chief minister, the
of Moray, as well as of other Protestant lords, who
d a rebellion against her, and were obliged to fly
England. Soon after, the jealousy of Darnley,
ting an Italian musician named Rizzio, who
as French secretary to the queen, united him in
piracy with the banished Protestant noblemen
e murder of that humble foreigner, which was
d under very barbarous circumstances, March
. Mary, who was delivered in the succeeding
f her son James, withdrew her affections entirely
r husband, and began to confide chiefly in the
Bothwell, who some months afterwards caused
to be blown up by gunpowder, while he lay in
of sickness; in which transaction it has always
spected, but never proved, that the queen had
erable share. Bothwell soon after forced her,
rance, into a marriage, which excited so much
ion among her subjects, that the same Protes-

tant lords who had effected the Reformation, and were the friends of Elizabeth, easily obtained the possession of her person, and, having deposed her, crowned her infant son as king, under the title of JAMES VI., while the regency was vested in the Earl of Moray. In May 1568, Mary escaped from her prison in Lochleven, and put herself at the head of a body of her partisans, but was defeated by the regent at the battle of Langside, and was then compelled to seek refuge in England. By placing her rival under strict confinement, and extending an effectual protection to the regents Moray, Lennox, Mar, and Morton, who successively governed Scotland, Elizabeth fortified herself in a great degree against the Catholic confederacy.

GOVERNMENT OF ELIZABETH.

It has already been seen that the liberties of the people were much favoured by the frequent interruptions in the succession to the crown. Whenever one branch of the Plantagenet family displaced another, the new king, feeling himself weak, endeavoured to strengthen his title by procuring a parliamentary enactment in support of it. It thus became established as a regular principle in the English government, that the people who were represented in Parliament had something to say in the appointment of their king. A considerable change, however, had taken place since the accession of Henry VII. The great power acquired by that king, through his worldly wisdom and the destruction of the nobility during the civil wars, had been handed down through four successive princes, who inherited the crown by birthright, and did not require to cringe to the people for a confirmation of their title. The Parliaments, therefore, were now a great deal more under the control of the sovereign than they had formerly been. From an early period of his reign, Henry VIII. never permitted his Parliament to oppose his will in the least. To the various changes of religion under successive sovereigns, the Parliaments presented no obstacle. An idea was now beginning to arise, very much through the supremacy which the sovereigns had acquired over the church, that the right of the crown was one derived from God, and that the people had nothing to do with it, except to obey what it dictated to them. Of this notion, no one took so much advantage, or was at so much pains to impress it, as Elizabeth. No doubt, her arbitrary measures were generally of a popular nature, yet this does not excuse them in principle; and their ultimate mischief is seen in the attempts of future sovereigns to pursue worse ends upon the same means. Elizabeth's government consisted entirely of herself and her ministers, who were, from the beginning to the end of her reign, the very choice of the enlightened men of England. Her prime minister was the celebrated Lord Burleigh, by far the most sagacious man who ever acted as a minister in Britain; and all her emissaries to foreign courts were of one complexion—circumspect and penetrating men, devoted to their country, their mistress, and to the Protestant religion.

On the accession of Elizabeth, the two celebrated acts of supremacy and conformity were passed, for the purpose of crushing the political influence of the Popish religion; an end which they sufficiently accomplished. By the act of supremacy, all beneficed clergymen, and all holding offices under the crown, were compelled to take an oath abjuring the temporal and spiritual jurisdiction of any foreign prince or prelate, on pain of forfeiting their offices, while any one maintaining such supremacy was liable to heavy penalties. The other statute prohibited any one from following any clergyman who was not of the established religion, under pain of forfeiting his goods and chattels for the first offence, of a year's imprisonment for the second, and of imprisonment during life for the third; while it imposed a fine of a shilling on any one absenting himself from the established church on Sundays and holidays. By means of a court of ecclesiastical commission, which the queen erected, these laws, and others of a more trifling

and vexatious nature, were enforced with great severity. It may afford some idea of the barbarity of the age, and of the terror in which the Church of Rome was now held, that, during the reign of Elizabeth, one hundred and eighty persons suffered death by the laws affecting Catholic priests and converts.

WAR IN THE NETHERLANDS.

For more than a century after the Reformation, religion was the real or apparent motive of the most remarkable transactions in European history. It is scarcely necessary to point out that this sentiment, though in general the purest by which human beings can be actuated, is, like all the other higher sentiments of our nature, when offended or shocked, capable of rousing the inferior sentiments into great activity. In the sixteenth and seventeenth centuries, European society was comparatively unenlightened and barbarous; we therefore find that variances of opinion respecting religion were then productive of far fiercer feelings than they are in our own more humane age. The Protestant heresy, as it was termed by the Catholics, was also a novelty, the remote effects of which no man could foretell; it was mingled with political questions, and by some princes was supposed to forebode a general revolt against monarchical authority. We are not therefore to wonder that great cruelties were committed, either by the Catholics in seeking to support the Church of Rome, or by the Protestants in endeavouring to ensure themselves against a renewal of severities inflicted by the opposite party. Nor is it necessary, in the present age, that the adherents of either faith should retain any feeling of displeasure against the other, on account of barbarities which took their rise in the ignorance and rudeness of a former period, and of which the enlightened of both parties have long since disapproved.

In the Netherlands, which formed part of the dominions of Philip II. of Spain, the reformed faith had made considerable advances. Philip, like other Catholic princes, entertained the idea that this new creed, besides being condemnable as a heresy and an offence against the Deity, tended to make men independent of their rulers. Finding the people obstinate in their professions, he commenced a war with the Netherlanders, for the purpose of enforcing his authority over their consciences. This war lasted about twenty years; for the Netherlanders, though a nation of no great strength, fought like desperate men, and endured the most dreadful hardships rather than submit. The chief leader in this war of liberty was William, Prince of Orange, one of the purest and most courageous patriots that ever breathed. Elizabeth could not help wishing well to the Netherlanders, though for a long time her dread of Spain, then one of the greatest powers in Europe, prevented her from openly assisting them. At the same time, about two millions of the people of France were Protestants, or, as they were then called, Huguenots, who acted also for the general Protestant cause with as much energy as the great strength of the French government would permit. Elizabeth at length, in 1578, extended an open protection to the Netherlanders, excusing herself to Philip by stating her fear that they would otherwise throw themselves into the arms of France. The northern provinces were thus enabled to assert their independence, and to form the country which has since been called Holland.

DEATH OF MARY, QUEEN OF SCOTS.

The Catholic powers of the continent formed many schemes for annoying or dethroning Elizabeth; and the imprisoned Scottish Queen, or her adherents, were generally concerned in them. The King of Spain, determined at length to make a decisive effort, commenced the preparation of a vast fleet, which he termed the Invincible Armada, and with which he designed to invade the English shores. Elizabeth, her ministers, and people, beheld the preparations with much concern, and their fears were increased by the plots which were incessantly forming amongst her Catholic subjects in behalf of the Queen of Scots. An act was passed declaring that any person, by or *for* whom any plot should be made against the Queen of England, should be guilty of treason. When, soon after, a gentleman named Babington formed a conspiracy for assassinating Elizabeth and placing Mary on the throne, the latter queen became of course liable to the punishment for treason, although herself innocent. She was subjected to a formal trial in her prison of Fotheringay Castle, and found guilty. Elizabeth hesitated for some time to strike an unoffending and unfortunate person, related to her own blood, and her equal in rank. But at length fears for herself got the better of her sense of justice, and it may be added, of her good sense, and she gave her sanction to an act which leaves an ineffaceable stain upon her memory. On the 7th of February 1587 Mary, Queen of Scots, was beheaded in the hall of the castle, after a confinement of more than eighteen years.

James VI. was now, after a turbulent minority, in possession of the reins of government in Scotland, but with little real power, being a dependant and pensioner of Elizabeth, and at the same time much controlled by the clergy, who asserted a total independence of all temporal authority, and considered themselves as the subjects alone of the divine founder of the Christian faith. James made many attempts to assert a control over the church like that enjoyed by the English monarch, and also to introduce an Episcopal hierarchy, but never could attain more than a mere shadow of his object. The chief influence he possessed arose from his being regarded as heir-presumptive to the English crown.

SPANISH ARMADA.—REBELLIONS IN IRELAND.

In 1588, the Spanish Armada, consisting of a hundred and thirty great vessels, with twenty thousand land forces on board, set sail against England, while thirty-four thousand more land forces prepared to join from the Netherlands. Amidst the consternation which prevailed in England, active measures were taken to defend the country; thirty vessels prepared to meet the Armada, and another fleet endeavoured to block up the Netherlands forces in port. The command was taken by Lord Howard of Effingham. Troops were also mustered on land to repel the invaders. The English fleet attacked the Armada in the Channel, and was found to have a considerable advantage in the lightness and manageableness of the vessels. As the Armada sailed along, it was infested by the English in the rear, and by a series of desultory attacks, so damaged as to be obliged to take refuge on the coast of Zealand. The Duke of Parma now declined to embark the Netherland forces, and it was resolved by the admiral, that the should return to Spain by sailing round the Orkneys, the winds were contrary to their passage directly home. Accordingly, they proceeded northward, and were followed by the English fleet as far as Flamborough-head, where they were terribly shattered by a storm. Seventeen of the ships, having 5000 men on board, were cast away on the Western Isles and the coast of Ireland. Of the whole Armada, fifty-three ships only returned to Spain, and these in a wretched condition. The sea men, as well as the soldiers who remained, were overcome with hardships and fatigue, and so dispirited by their discomfiture, that they filled all Spain with accounts of the desperate valour of the English, and of the tempestuous violence of that ocean by which they were surrounded.

Though the Protestant church had meanwhile been established in Ireland, the great bulk of the people continued to be Roman Catholics. The native rudeness of the people and their chiefs, and the discontent occasioned by what was considered as a foreign church establishment, rendered the country turbulent and difficult to govern. Sir John Perrot, the deputy, proposed to improve the country by public works and English laws, but it was thought injurious to England to improve the

of Ireland. A series of rebellions under chiefs Neill was the consequence, and the English st was maintained with great difficulty, and mous expense. The rebellion of Hugh O'Neill, Tyrone, was particularly formidable. The fficers were at first unsuccessful, and met serious defeats. In 1599, Tyrone gained so ictory, that the whole province of Munster for him. He then invited the Spaniards to scent on Ireland, and join him. The queen her favourite, the Earl of Essex, with 20,000 ; he did not proceed with vigour, and soon d it necessary to return to England to justify Next year Tyrone broke the truce he had ith Essex, overran the whole country, and overeign of Ireland. If Spain had at this time the support he asked, Ireland might have vered from the English crown.

th now selected, as her deputy for Ireland, ord Mountjoy, who was in every respect d than Essex to conduct such a warfare. As ary step, this sagacious officer introduced nd disunion among the Irish chiefs. The ity of his movements tended to dispirit the . In 1601, six thousand Spaniards landed harbour, for the purpose of supporting the ountjoy immediately invested the place, and them from acting. Tyrone marched from f Ireland to their relief, and was met and n by a much inferior English force, after ale was surrendered. About the time when lied (1603), Tyrone submitted, and Ireland nore reduced under the authority of the Eng-

the close of 1601, she fell into a deep hypo-or melancholy. She could scarcely be induced herself dressed, and at length became so much d by her sorrow as to refuse sustenance, and ays and nights on the floor, supported by a few brought to her by her attendants. On the March 1603, she expired, after a reign of nearly 5 years, during which England advanced from ition of a second-rate to that of a first-rate nd the Protestant religion was established on from which it could never afterwards be

The reign of Elizabeth saw the commencement of the naval glory of England. Down to the reign of Henry VII., there was no such thing as a navy belonging to the public, and the military genius of the people was devoted exclusively to enterprises by land. The rise, however, of a commercial spirit in Europe, which in 1492 had caused the discovery of America, and was again acted upon by the scope for adventure which that discovery opened up, had latterly caused great attention to be paid to nautical affairs in England. Englishmen of all ranks supported and entered into enterprises for discovering unknown territories; and under Drake, Cavendish, Raleigh, and Frobisher, various expeditions of less or more magnitude were sent out. The colonies of North America were now commenced. Amongst the exertions of private merchants, our attention is chiefly attracted by the commencement of the northern whale-fishery, the cod-fishery of Newfoundland, and the less laudable slave-trade in Africa. When hostilities with Spain became more open, the English commanders made many successful attacks upon her colonies in the West Indies, and also upon the fleets of merchant vessels which were employed to carry home the gold, and other almost equally valuable products of the New World, to the Spanish harbours. These attacks were now made in a more systematic manner, and with more effect, as a revenge for the affair of the Armada. It may almost be said that the dominion of Britain over the seas was perfected in one reign; a power which has been of such advantage to the country, both in protecting its commerce and keeping it secure from foreign invasion, that its origin would have conferred everlasting lustre on this period of our history, even although it had not been characterised by any other glorious event.

The chief articles exported from England to the Continent were wool, cloth, lead, and tin: formerly these had been sent in vessels belonging to the Hanse Towns —certain ports of the north of Europe, possessing great privileges—but now English vessels were substituted for this trade. Birmingham and Sheffield were already thriving seats of the hardware manufacture, and Manchester was becoming distinguished for making cottons, rugs, and friezes. Stocking-weaving and the making of sailcloth, serge, and baize, took their rise in this reign. The progress of other arts was much favoured by the bloody persecutions in the Netherlands, which drove into England great numbers of weavers, dyers, cloth-dressers, and silk-throwers. Amongst the wealthier classes, the wearing of handsome apparel and of gold ornaments and jewellery, made a great advance. Coaches were introduced, but for a time thought only fit for the use of ladies. Great improvements were made in the building of houses. Theatrical amusements were begun, and attained great vogue, though only in London. The smoking of tobacco was introduced by Sir Walter Raleigh, who became acquainted with the plant in Virginia. At the end of Elizabeth's reign, the population of London was about 160,000, or a tenth of what it now is; and the whole kingdom probably contained about 5,000,000 of inhabitants.

THE STUARTS.—JAMES I.

The successor of Elizabeth, by birthright, was JAMES VI. OF SCOTLAND (styled JAMES I. OF ENGLAND), who was now arrived at the prime of life, and had been married for some years to the Princess Anne of Denmark, by whom he had two sons, Henry and Charles, and one daughter named Elizabeth. James immediately removed to London, and assumed the government of England, while his native kingdom, though thus united under the same sovereignty, still retained its own peculiar institutions. At the suggestion of the king, who wished to obliterate the distinction of the two countries, the common name of *Great Britain* was now conferred upon them. King James was an oddity in human character. His person was naturally feeble, particularly in the limbs, which were scarcely sufficient to support his weight. He had great capacity for learning, some

acuteness, and a considerable share of wit; but was pedantic, vain, and weak. He believed kings to be the deputies of God, and accountable to God alone for their actions. He was equally disposed with Elizabeth to govern despotically, or according to his own will; but he wanted the vigour and the turn for popularity which enabled his predecessor to become so much the mistress of her subjects.

Notwithstanding the energy of Elizabeth, the popular spirit had gradually been acquiring force in her reign. It was chiefly seen in the sects of the Puritans, a religious party, who wished to make great reforms in the church, both in its government and its worship, and who, from the fervour of their devotions and the strictness of their manners, might be likened to the Presbyterians of Scotland. King James found considerable difficulty at the very first in controlling this party and evading their demands. He was no less troubled, on the other hand, by the Catholics, who, recollecting his mother Mary, conceived that he would be inclined to make matters more easy to them in England. Upon the whole, there were such difficulties in the way, as, to have steered clearly through them, would have required a wiser instead of a weaker ruler than Elizabeth.

GUNPOWDER PLOT.

The disappointment of the Catholics, on finding that the severe laws against them were not to be relaxed, led to a conspiracy on the part of a few gentlemen of that persuasion, of whom the chief was William Catesby, a person of dissolute habits. It was arranged that, on the day of the meeting of Parliament, November 5, 1605, the House of Lords should be blown up by gunpowder, at the moment when the King, Lords, and Commons, were all assembled in it, thus destroying, as they thought, all their chief enemies at one blow, and making way for a new government which should be more favourable to them. Accordingly, thirty-four barrels of powder were deposited in the cellars beneath the house, and a person named Guy Fawkes was prepared to kindle it at the proper time. The plot was discovered, in consequence of the receipt of a letter by Lord Monteagle, warning him not to attend the meeting of Parliament. An investigation took place during the night between the 4th and 5th of November, when the gunpowder was discovered, and Fawkes taken into custody. He confessed his intentions; and the rest of the conspirators fled to the country, where most of them were cut to pieces in endeavouring to defend themselves. Notwithstanding the atrocious character of this plot, the king could never be induced to take advantage of it, as most of his subjects desired, for the purpose of increasing the persecution of the Catholic party: he probably feared that new severities might only give rise to other attempts against his life.

PLANTATIONS IN IRELAND.

The state in which the king found Ireland at his accession, afforded an opportunity for commencing a more generous policy in reference to that country, and introducing regulations favourable to internal improvement. Previously to this reign, the legislative authority of the English government was confined to the small district called the "Pale," while the rest was governed by native sovereigns or chiefs, whose connexion with the King of England was merely that of feudal homage, which did not prevent them from making wars or alliances with each other. Subject to depredations from these powerful barons, the native Irish, from a very early period, petitioned for the benefit of the English laws; but the Irish Parliament, which was composed of the English barons, was never at a loss for the means of preventing this desirable measure from being effected. James was, in reality, the first king who extended the English law over the whole of Ireland, by making judicial appointments suited to the extent of the country. This he was enabled to do, by the recent wars having put the country more completely in his power than it had been in that of any former monarch. He began by extending favour to the Irish chiefs, not e Tyrone. He passed an act of oblivion and in by which all persons who had committed offenc ing to the judges of assize within a certain da claim a full pardon. At the same time, tolera virtually refused to the Catholic persuasion, a discontent therefore still existed. Some of t taina, having conspired against the crown, tainted, and their lands were given to English with a view to improving the population of the by an infusion of civilised persons. But this ment, though well-meant, was managed in a spirit, and gave rise to much injustice. In 1 first Irish Parliament was held in which the any representatives of places beyond the Pale.

THE KING'S CHILDREN.—THE SPANISH MATC

In 1612, the king had the misfortune to lose h son, Henry, a youth of nineteen, who was co as one of the most promising and accomplishe the age. The second son, Charles, then bec heir-apparent, and James was busied for seve in seeking him out a suitable consort. The Mary of Spain was selected, a match which cou popular, considering that the young lady was a and of a family who had long been the enemies land. The prince, attended by the Duke of B ham, made a romantic journey in disguise to to push the match; but a quarrel between the and Spanish ministers led to its being broken to a bloody war between the two nations.

Elizabeth, the only remaining child of the ki married, in 1613, to Frederick, Prince Palatin Rhine, who was afterwards so unfortunate as his dominions, in consequence of his placing hi the head of the Bohemians, in what was consi a rebellion against his superior, the Emperor many. This discrowned pair, by their youngest d Sophia, who married the Duke of Brunswick, ancestors of the family which now reigns in Br

FEATURES OF JAMES I.'S GOVERNMENT.

The reign of James I. was not marked by called great events. This was greatly owing timid character, which induced him to maintai at whatever sacrifice, throughout the greater pa reign. The prime leaders of his governme youthful favourites, who possessed no merit sonal elegance. Experienced statesmen, brave and learned divines, had to bow to these dissolute if they wished to remain, and still more if the to advance, in the royal favour. Even Bac noblest intellect of the age, and who, by the his studies, has done more than almost any otl to promote the progress of knowledge, is found attached himself to the minion Duke of Buck for the purpose of improving his interest at co

In despotic countries, the vices of the cou corrupt all classes; but it was otherwise at tha in Britain. The country gentlemen, and the me in the incorporated towns, had privileges wh court dared not too often violate, and a feeling tude and independence was encouraged amon classes, which the statesmen of the age too muc looked. The House of Commons gave frequen ance to the court, and often compelled James t at the very moment when he was preaching h trines of divine right. In his first Parliament, th into consideration several grievances, such as *ance*, a supposed right in the officers of the seize what provisions they pleased, at any pric no price; another was the right of granting *mon* which had become a source of revenue to the c cheating the country, certain persons having th poly of certain manufactures and articles of d consumption, which they were allowed to fur their own prices. The Commons likewise remon against pluralities in the church, and against a of canons which the king and the church tried

nation without their consent. In 1614, they ed to postpone any supply till their grievances dressed. The king, in his turn, threatened to them if they did not immediately grant a sup- d they allowed him to take his course, which fill his coffers. These, and many other instances resistance, should have given warning to the They were the shadows of coming events, and n to them might have saved the bloodshed and n of the next reign.

It is also shown in the ad- dramatic writings of Shakspeare, and in the e philosophic works of Bacon. The inductive phy, made known by the last writer—namely, de of reasoning which consists in first ascertain- n, and then inferring conclusions from them— peculiar lustre on this period of our history. reat praise is also due to Napier of Merchiston, land, for the invention of *logarithms*, a mode of ting great numbers, essential to the progress of natical science.

LES I.—HIS CONTENTIONS WITH THE HOUSE OF COMMONS.

James died in March 1625, in the fifty-ninth his age, and was succeeded by his son CHARLES, enty-five years of age. One of the first acts of ng king was to marry the Princess Henrietta daughter of Henry IV. of France, and a Catholic. s an unfortunate step for the house of Stuart, two eldest sons of the king and queen, though d as Protestants, were influenced in some mea- r the religious creed of their mother, so that they ely became Catholics; and this, in the case of ond son, James II., led to the family being ex- from the throne.

r breaking off the proposed match with the Prin- ary of Spain, Britain eagerly threw itself into a ith that country, which was still continued. To the expenses of that contest, and of a still more ssary one into which he was driven with France, g applied to Parliament, but was met there with ly complaints as to his government, and such a pirit of popular liberty, that he deemed it neces- revive a practice followed by other sovereigns, rticularly Elizabeth, of compelling his subjects t him gifts, or, as they were called, *benevolences*, o to furnish ships at their own charge, for car- on the war. Such expedients, barely tolerated the happy reign of Elizabeth, could not be en- in this age, when the people and the Parliament e much more alive to their rights. A general ent spread over the nation. The Commons, see- t if the king could support the state by self-raised he would soon become independent of all control is Parliaments, resolved to take every measure ir power to check his proceedings. They also d him respecting a right which he assumed to on his subjects upon his own warrant, and to them as long as he pleased. Having made an y into the ancient powers of the crown, before owers had been vitiated by the tyrannical Tudors, mbodied the result in what was called a PETITION HT, which they presented to him as an ordinary rather as a second Magna Charta, for replacing ivileges of the people, and particularly their ex- n from arbitrary taxes and imprisonment, upon basis. With great difficulty Charles was pre- upon to give his sanction to this bill (1628); but putes with Parliament soon after ran to such a , that he dissolved it in a fit of indignation, re- never more to call it together. About the same is favourite minister, the Duke of Buckingham, assinated at Portsmouth, and Charles resolved thenceforward to be in a great measure his own minister, and to trust chiefly for the support of his government to the English hierarchy, to whose faith he was a devoted adherent, and who were, in turn, the most loyal of his subjects. His chief counsellor was Laud, Archbishop of Canterbury, a man of narrow and bigoted spirit, and who made it his duty rather to increase than to diminish the ceremonies of the English church, although the tendency of the age was decidedly favourable to their diminution. For some years Charles governed the country entirely as an irresponsible despot, levying taxes by his own orders, and imprisoning such persons as were obnoxious to him, in utter defiance of the Petition of Right. The Puritans, or church reformers, suffered most severely under this system of things. They were dragged in great numbers before an arbitrary court called the Star-Chamber, which professed to take cognisance of offences against the king's prerogative, and against religion; and sometimes men venerable for piety, learning, and worth, were scourged through the streets of London, and had their ears cut off, and their noses slit, for merely differing in opinion, on the most speculative of all subjects, with the king and his clergy. The great body of the people beheld these proceedings with horror, and only some opportunity was wanted for giving expression to the public feeling.

It is to be observed, that none of the taxes imposed by Charles were in themselves burdensome; the country was then in a most prosperous condition, and the taxes far less in proportion to every man's means than they have ever since been. It was only to the principle of their being raised without Parliamentary sanction, which had formerly been so necessary a control on the royal power, that the people were disposed to resist them. It may easily be supposed, that, though there might be a general disposition to resistance, the most of individuals would not like to be the first to come forward for that purpose, as, in such an event, they would have been sure to experience the severest persecution from the court. At length, John Hampden, a gentleman of Buckinghamshire, resolved to undergo any personal inconvenience rather than pay his twenty shillings of ship-money. The case was tried in the Exchequer (1637); and as the judges were then dismissible at the royal pleasure, and of course the humble servants of the king in every thing, Hampden lost his cause. He roused, however, more effectually than ever, the attention of the people to this question, and means were not long wanting to check the king in his unfortunate career.

TROUBLES IN SCOTLAND—THE NATIONAL COVENANT.

An attempt had been made by King James to introduce the Episcopal Church into Scotland, because it was thought dangerous to the English church that a form of worship, resembling that of the Puritans, should be permitted to exist in any part of the king's dominions. The same object was prosecuted with greater zeal by King Charles; and although the people were generally adverse to it, he had succeeded, after a visit which he paid to the country in 1633, in settling thirteen bishops over the church, by whom he hoped to govern the clergy as he did those of England. But when he attempted, in 1637, to introduce a new Book of Common Prayer into the Scotch churches, the spirit of the people could no longer be kept within bounds. On the Liturgy being opened in the principal church at Edinburgh, the congregation rose in a violent tumult, and threw their clasped Bibles, and the very stools they sat on, at the minister's head; and it was not till the whole were expelled by force, that the worship was permitted to proceed. It was found necessary, by the Scottish state-officers, to withdraw the obnoxious Liturgy, till they should consult the king, who, not dreading any mischief, gave orders that it should be used as he had formerly directed, and that the civil force should be employed in protecting the clergymen. It was found quite impossible to obey such an order in the face of an united people, who, by committees as-

child, Mary, who was not above a week old. Henry immediately conceived the idea of marrying his son Edward to this infant queen, by which he calculated that two hostile nations should be united under one sovereignty, and the Protestant Church in England be supported by a similar establishment in Scotland. This project, however, was resisted by the Scots, of whom very few as yet were inclined to the Protestant doctrines. Henry, enraged at their hesitation, sent a fleet and army, in 1544, to inflict vengeance upon them. The Scots endured with great patience the burning of their capital city, and many other devastations, but still refused the match. The government of Scotland was now chiefly in the hands of Cardinal Beaton, a man of bold and decisive intellect, who zealously applied himself to suppress the reforming preachers, and regarded the English match as likely to bring about the destruction of his religion.

EDWARD VI.—QUEEN MARY.

Henry died, January 28, 1547, leaving the throne to his only son, a boy of ten years of age, who was immediately proclaimed king under the title of Edward VI. The Duke of Somerset, maternal uncle to the young king, became supreme ruler under the title of Protector, and continued to maintain the Protestant doctrines. Under this reign, the church of England assumed its present form, and the Book of Common Prayer was composed nearly as it now exists. Somerset being resolved to effect, if possible, the match between Edward VI. and Mary of Scotland, invaded that country in autumn 1547, and was met at Musselburgh by a large army under the governor, the Earl of Arran. Though the Scotch were animated by bitter animosity against the English, against their religion, and against the object of their expedition, they did not fight with their usual resolution, but were defeated, and pursued with great slaughter. Finding them still obstinate in refusing to give up their queen, Somerset laid waste a great part of the country, and then retired. Previous to this period, Cardinal Beaton had been assassinated by private enemies; but the Scotch were encouraged to persevere by the court of France, to which they now sent the young queen for protection.

In the reign of Edward VI. the government was conducted mildly, until the Protector Somerset was degraded from his authority by the rising influence of Dudley, Duke of Northumberland, who caused him soon after to be tried and executed. Northumberland, who was secretly a Roman Catholic, was not so mild or popular a ruler. Yet, throughout the whole reign of Edward VI., which was terminated by his death on the 6th of July 1553, at the early age of sixteen, no religious party was persecuted, except those who denied the fundamental doctrines of the Christian religion. It would have been well for the honour of a church which has produced many great men, and to which the modern world is indebted for the very existence of Christianity, if it had not been tempted after this period to commence a very different course of action. The crown now belonged by birthright to Mary, the eldest daughter of Henry VIII., who was a zealous Catholic. Northumberland, however, assuming the illegitimacy of that princess and her sister Elizabeth, set up as queen the Lady Jane Grey, who was descended from a younger sister of King Henry, and who had been married to a son of the Duke of Northumberland. Lady Jane was the most beautiful, most intelligent, and most amiable of all the females who appear in the history of England. Though only seventeen, she was deeply learned, and yet preserved all the unaffected graces of character proper to her interesting age. Unfortunately, her father-in-law Northumberland was so much disliked, that the Catholics were enabled to displace her from the throne in eight days, and to set up in her stead the Princess Mary. Northumberland, Lady Jane, and her husband, Guildford Lord Dudley, were all beheaded by that same princess, who soon after took steps for restoring Catholic religion, and married Philip II., King of Spain, in order to strengthen [illegible] testant interest. Mary ex[illegible] from her Protestant subject[illegible] suspicion of her sister Elizab[illegible] formed faith, but took no p[illegible] on the point of ordering her [illegible] as she had replaced the Catholic system, and found herself in possession of sufficient power, she began a career of persecution which has rendered her name infamous. Five out of fourteen Protestant bishops, including the revered names of Cranmer, Latimer, Ridley, were committed to the flames as heretics; during the ensuing part of her reign, which was cut by her death, November 17, 1558, nearly three hundred persons suffered in the same manner. These acts did not take place without exciting horror in the minds of Englishmen in general, including even many Catholics; but the royal authority was at all times too great under this line of princes to allow of effectual resistance. Such a persecution, however, naturally fixed in the minds of the British Protestants a hereditary hatred for the name of Catholic, which has in its turn been productive of many retaliatory persecutions also equally to be lamented. In the latter part of her reign she was drawn by her husband into a war with France, of which the only effect was the loss of Calais, the last of the French possessions of the sovereigns of England. The natural sourness of Mary's temper was increased by this disgraceful event, as well as by her want of children, and she died in a state of great unhappiness.

ELIZABETH.—MARY, QUEEN OF SCOTS.—REFORMATION IN SCOTLAND.

A more auspicious scene opened for England in the accession of Elizabeth, a princess of great native vigour of mind, and who had been much improved by adversity, having been kept in prison during the whole reign of her sister. From the peculiar circumstances of Elizabeth's birth, her right of succession was denied by the Catholics at home and abroad. This party considered Mary, Queen of Scots, who was descended as the eldest sister of Henry VIII., and had been brought up in the Catholic faith at the court of France, as the legitimate sovereign. Elizabeth had no support in any quarter, except among her Protestant subjects. The Pope issued a bull, which, directly or indirectly, pronounced her an usurper, and gave permission to his subjects to remove her from the throne. The court of France professed to consider the Queen of Scots, who had recently been married to the Dauphin, as the Queen of England. Under these circumstances, Elizabeth found no chance of safety except in restoring and maintaining the Protestant religion in her own country, and in seeking to support it in all others where the people were favourable to it. The Scottish nation being now engaged in a struggle with their regent, Mary of Guise, in behalf of Protestantism, Elizabeth gladly acceded to a proposal made by the nobles of that country, and sent a party of troops, by whose assistance the reformed religion was established (1560). In bringing about this change, the chief native leaders were James Stewart, a natural son of King James V., and John Knox, who had once been a friar, but was now a Protestant preacher. As a natural consequence of the obligation which the English queen had conferred upon the Scottish reformers, she acquired an influence over the country which was never altogether lost.

About the time when the Scottish Parliament was establishing the reformed religion, Mary of Guise breathed her last, leaving the country to be managed by the reforming nobles. Her daughter, the Queen of Scots, now eighteen years of age, and the most beautiful woman of her time, had in 1559 become the queen consort of France; but, in consequence of the death of her husband, she was next year left without any political interest in that country. She accordingly, in August 1561, returned to Scotland, and assumed the sovereignty of a country which was chiefly under the rule of fierce nobles, and where the people, from the

, and did some injury to the king's cause in
ıtries. After spending about three months in
;h, Charles was suddenly called away in con-
of intelligence which reached him from Ire-

uel policy already mentioned, by which large
of Ireland were depopulated, and then planted
ies of English and Scotch settlers, had been
d during the reign of Charles. In addition to
other local causes of complaint, the state of
ras one which pervaded nearly the whole coun-
was always becoming more and more impor-
hough the reformed faith had been established
y a century, it had made little progress except
ie English settlers. The greater part of the
and also of the lower orders, were still at-
) the ancient creed; and a Catholic hierarchy,
d by the Pope, and supported by the people,
ıs much respect and obedience as when that
was countenanced by the state. The refusal
ıtholics to take the oath of supremacy, which
dged the king to possess a right which their
ght them to belong to the Pope, necessarily
them from all branches of the public service.
ere also penal laws against the profession of
sm, and a severe court of Star-Chamber to
se into execution. Thus situated, the Irish
had two strong motives to mutiny—a confi-
their numbers, and a constant sense of suffer-
r the government.

13, the Earl of Strafford was appointed viceroy
d. His government was vigorous, and those
ns which he thought proper to patronise, flou-
nder it; but his great aim was to make the
olute, and he rather subdued than conciliated
lar spirit. When summoned in 1640 to attend
; in England, he left the Irish government in
ls of Sir William Parsons and Sir John Borlase,
justices. Immediately after his departure,
it which he thought he had quelled began to
ır, being encouraged both by his absence, and
success which the Scottish Covenanters had
eed in a war against religious restraint. A
acy, involving most of the country without the
d including many persons within it, was formed
nder the direction of a gentleman named
Moore, who possessed many qualities calculated
ır him to the people. Some circumstances ex-
he suspicion of the Protestants; and, among
the return of several officers who had been in
vice of the King of Spain, under pretence of
ing for the Spanish army. But the apparent
lity of the country baffled all scrutiny.

23d of October 1641, being a market day, was
s for the capture of Dublin Castle. During the
n day, nothing had occurred to alarm the autho-
In the evening of the 22d, the conspiracy was
tally discovered, and measures were taken to
blin; but a civil war raged next morning in
and speedily spread over the country. The de-
Sir Phelim O'Neill, and the other leaders of the
ction, was simply political. They conceived the
good one for striking a blow against the govern-
s the Scots had done; and their conduct was in
ost characterised by lenity. They could not,
r, allay the hatred with which the Catholics
pon their adversaries; and a spirit of revenge
et among their followers, which was aggravated
l outrage, when they heard that the conspiracy
overed in Dublin. The spirit of retaliation was
, and political wrongs, unfeelingly inflicted, were,
en the case, ferociously avenged. The massacre
numense number of Protestants held forth an
mon of the effects which oppressive laws pro-
the human passions. The government rather
ded than alleviated the evil, by offering the
of all in rebellion to those who should aid in
g them to obedience. This drove the insurgents
eration, and postponed the complete extinction

of the war for several years. It is to be remarked, that, though the Irish were struggling for both national and religious freedom, they gained no sympathy from the patriots of Britain, who, on the contrary, urged the king to suppress the rebellion, being afraid that a religious toleration in Ireland would be inconsistent with the same privilege in their own country. The Scottish Covenanters, themselves so recently emancipated from a restraint upon their consciences, contributed ten thousand troops to assist in restoring that restraint upon the Irish.

THE CIVIL WAR.

It was generally allowed by moderate people, that in the autumn of 1641, at which time the labours of the Parliament had continued one year, the king had granted redress of all the abuses for which the earlier part of his reign, and the British constitution in general, were blameable. Unfortunately, the character of the king for fidelity to his engagements was not sufficiently high to induce the leaders of the House of Commons to depend upon him: they feared that, if they once permitted him to resume his authority, there would be no longer any safety for them; and they deemed it necessary that things should be prevented from falling into their usual current. They therefore prepared a paper called *The Remonstrance*, containing an elaborate view of all the grievances that had ever existed, or could now be supposed to exist; and this they not only presented to the king, but disseminated widely among the people, with whom it served to increase the prevailing disaffection.

From this time it was seen that the sword could alone decide the quarrel between the king and the Parliament. Charles made an unsuccessful attempt (January 4, 1642) to seize six of the most refractory members, for the purpose of striking terror into the rest. This served to widen the breach. In the early part of 1642, the two parties severally employed themselves in preparing for war. Yet, even now, the king granted some additional concessions to his opponents. It was at last, upon a demand of the Parliament for the command of the army—a privilege always before and since resting with the crown—that he finally broke off all amicable intercourse. He retired with his family to York.

The Parliament found its chief support in the mercantile classes of London and of the eastern coast of England, which was then more devoted to trade than the west, and in the Puritan party generally, who were allied intimately with the Presbyterians of Scotland, if not rapidly becoming assimilated with them. Charles, on the other hand, looked for aid to the nobility and gentry, who were able to bring a considerable number of dependants into the field. The Parliamentary party was by the other styled *Roundheads*, in consequence of their wearing short hair; while the friends of the Parliament bestowed upon their opponents the epithet of *Malignants*. The Royalists were also, in the field, termed Cavaliers, from so many of them being horsemen.

On the 25th of August the king erected his standard at Nottingham, and soon found himself at the head of an army of ten thousand men. The Parliament had superior forces, and a better supply of arms; but both parties were very ignorant of the art of war. The king commanded his own army in person, and the Parliamentary forces were put under the charge of the Earl of Essex.

The first battle took place, October 23, at Edgehill, in Warwickshire, where the king had rather the advantage, though at the expense of a great number of men. He gained some further triumphs before the end of the campaign, but still could not muster so large an army as the Parliament. During the winter, the parties opened a negotiation at Oxford; but the demands of the Parliament being still deemed too great by the king, it came to no successful issue.

Early in the ensuing season, the king gained some

and vexatious nature, were enforced with great severity. It may afford some idea of the barbarity of the age, and of the terror in which the Church of Rome was now held, that, during the reign of Elizabeth, one hundred and eighty persons suffered death by the laws affecting Catholic priests and converts.

WAR IN THE NETHERLANDS.

For more than a century after the Reformation, religion was the real or apparent motive of the most remarkable transactions in European history. It is scarcely necessary to point out that this sentiment, though in general the purest by which human beings can be actuated, is, like all the other higher sentiments of our nature, when offended or shocked, capable of rousing the inferior sentiments into great activity. In the sixteenth and seventeenth centuries, European society was comparatively unenlightened and barbarous; we therefore find that variances of opinion respecting religion were then productive of far fiercer feelings than they are in our own more humane age. The Protestant heresy, as it was termed by the Catholics, was also a novelty, the remote effects of which no man could foretell; it was mingled with political questions, and by some princes was supposed to forebode a general revolt against monarchical authority. We are not therefore to wonder that great cruelties were committed, either by the Catholics in seeking to support the Church of Rome, or by the Protestants in endeavouring to ensure themselves against a renewal of severities inflicted by the opposite party. Nor is it necessary, in the present age, that the adherents of either faith should retain any feeling of displeasure against the other, on account of barbarities which took their rise in the ignorance and rudeness of a former period, and of which the enlightened of both parties have long since disapproved.

In the Netherlands, which formed part of the dominions of Philip II. of Spain, the reformed faith had made considerable advances. Philip, like other Catholic princes, entertained the idea that this new creed, besides being condemnable as a heresy and an offence against the Deity, tended to make men independent of their rulers. Finding the people obstinate in their professions, he commenced a war with the Netherlanders, for the purpose of enforcing his authority over their consciences. This war lasted about twenty years; for the Netherlanders, though a nation of no great strength, fought like desperate men, and endured the most dreadful hardships rather than submit. The chief leader in this war of liberty was William, Prince of Orange, one of the purest and most courageous patriots that ever breathed. Elizabeth could not help wishing well to the Netherlanders, though for a long time her dread of Spain, then one of the greatest powers in Europe, prevented her from openly assisting them. At the same time, about two millions of the people of France were Protestants, or, as they were then called, Huguenots, who acted also for the general Protestant cause with as much energy as the great strength of the French government would permit. Elizabeth at length, in 1578, extended an open protection to the Netherlanders, excusing herself to Philip by stating her fear that they would otherwise throw themselves into the arms of France. The northern provinces were thus enabled to assert their independence, and to form the country which has since been called Holland.

DEATH OF MARY, QUEEN OF SCOTS.

The Catholic powers of the continent formed many schemes for annoying or dethroning Elizabeth; and the imprisoned Scottish Queen, or her adherents, were generally concerned in them. The King of Spain, determined at length to make a decisive effort, commenced the preparation of a vast fleet, which he termed the Invincible Armada, and with which he designed to invade the English shores. Elizabeth, her ministers, and people, beheld the preparations with much concern, and *their fears were increased* by the plots which were incessantly forming amongst her Catholic subjects behalf of the Queen of Scots. An act was passed claring that any person, by or *for* whom any plot sho be made against the Queen of England, should be gu of treason. When, soon after, a gentleman nam Babington formed a conspiracy for assassinating Eli beth and placing Mary on the throne, the latter qu became of course liable to the punishment for treas although herself innocent. She was subjected to a f mal trial in her prison of Fotheringay Castle, and fo guilty. Elizabeth hesitated for some time to strike unoffending and unfortunate person, related to her blood, and her equal in rank. But at length fears herself got the better of her sense of justice, and may be added, of her good sense, and she gave sanction to an act which leaves an ineffaceable st upon her memory. On the 7th of February 15 Mary, Queen of Scots, was beheaded in the hall the castle, after a confinement of more than eight years.

James VI. was now, after a turbulent minority, possession of the reins of government in Scotland, with little real power, being a dependant and pensio of Elizabeth, and at the same time much controlled the clergy, who asserted a total independence of temporal authority, and considered themselves as subjects alone of the divine founder of the Christ faith. James made many attempts to assert a con over the church like that enjoyed by the English narch, and also to introduce an Episcopal hierarc but never could attain more than a mere shadow of object. The chief influence he possessed arose fr his being regarded as heir-presumptive to the Eng crown.

SPANISH ARMADA.—REBELLIONS IN IRELAND.

In 1588, the Spanish Armada, consisting of a hund and thirty great vessels, with twenty thousand l forces on board, set sail against England, while thi four thousand more land forces prepared to join fr the Netherlands. Amidst the consternation which p vailed in England, active measures were taken to fend the country; thirty vessels prepared to meet Armada, and another fleet endeavoured to block up Netherlands forces in port. The command was tak by Lord Howard of Effingham. Troops were a mustered on land to repel the invaders. The Engl fleet attacked the Armada in the Channel, and was fou to have a considerable advantage in the lightness manageableness of the vessels. As the Armada sai along, it was infested by the English in the rear, a by a series of desultory attacks, so damaged as to obliged to take refuge on the coast of Zealand. T Duke of Parma now declined to embark the Netherla forces, and it was resolved by the admiral, that th should return to Spain by sailing round the Orkneys, the winds were contrary to their passage directly ba Accordingly, they proceeded northward, and were lowed by the English fleet as far as Flamborough-he where they were terribly shattered by a storm. Sev teen of the ships, having 5000 men on board, were c away on the Western Isles and the coast of Ireland. the whole Armada, fifty-three ships only returned Spain, and these in a wretched condition. The s men, as well as the soldiers who remained, were overcome with hardships and fatigue, and so dispiri by their discomfiture, that they filled all Spain with counts of the desperate valour of the English, and the tempestuous violence of that ocean by which th were surrounded.

Though the Protestant church had meanwhile be established in Ireland, the great bulk of the people c tinued to be Roman Catholics. The native rudeness the people and their chiefs, and the discontent occasion by what was considered as a foreign church establi ment, rendered the country turbulent and difficult govern. Sir John Perrot, the deputy, proposed to i prove the country by public works and English law but it was thought injurious to England to improve t

...of Ireland. A series of rebellions under chiefs ...d O'Neill was the consequence, and the English ...power was maintained with great difficulty, and ...sometimes expenses. The rebellion of Hugh O'Neill, ...of Tyrone, was particularly formidable. The ...h officers were at first unsuccessful, and met ...some serious defeats. In 1600, Tyrone gained so ...a victory, that the whole province of Munster ...out for him. He then invited the Spaniards to ...a descent on Ireland, and join him. The queen ...over her favourite, the Earl of Essex, with 20,000 ...foot; but he did not proceed with vigour, and soon ...found it necessary to return to England to justify ...himself. Next year Tyrone broke the truce he had ...made with Essex, overran the whole country, and ...was sovereign of Ireland. If Spain had at this time ...given him the support he asked, Ireland might have ...been severed from the English crown.

...Elizabeth now wheeled, as her deputy for Ireland, ...Lord Mountjoy, who was in every respect ...better than Essex to conduct such a warfare. As ...a military step, this sagacious officer introduced ...order and discipline among the Irish chiefs. The ...celerity of his movements tended to dispirit the ...rebels. In 1601, six thousand Spaniards landed ...at Kinsale harbour, for the purpose of supporting the ...rebellion. Mountjoy immediately invested the place, and ...compelled them from acting. Tyrone marched from ...the north of Ireland to their relief, and was met and ...driven by a much inferior English force, after ...which Kinsale was surrendered. About the time when ...Elizabeth died (1603), Tyrone submitted, and Ireland ...became more reduced under the authority of the Eng...lish crown.

CONCLUDING OF THE REIGN OF ELIZABETH.

It is remarkable, that while Elizabeth increased in ...power and resources, she became more noted for femi...nine weaknesses. In her early years she had shown a ...passion, and superiority to natural affections, not ...usually observed in women. But in her old age, she ...became both volatile and susceptible to an extraordi...nary degree; so that the hand which she had withheld, ...in her younger days, from the noblest princes of Europe, ...was lavishly to be bestowed, in her old age, upon some ...contemptible court minion. Her favourite in middle life was ...Robert, Earl of Leicester, a profligate and a trifler. In ...her latter days she listened to the addresses of the ...Earl of Essex, a young man of greater courage and ...better principle, but also headstrong and weak. Essex, ...who had acquired popularity by several brilliant mili...tary exploits, began at length to assume an insolent ...superiority over the queen, who was, on one occasion, ...so much provoked by his rudeness as to give him a ...box on the ear. Notwithstanding all his caprices ...and insults, the queen still doatingly forgave him, until ...at length he attempted to raise an insurrection against ...her in the streets of London, when he was seized, con...victed, and after much hesitation, executed (February ...1601).

...Elizabeth, in at last ordering the execution of Essex, ...acted upon her usual principle of sacrificing her ...private to what was necessary for the public cause; but ...the effect, made in the sixty-eighth year of her age, ...had miscalculated the real strength of her nature. ...She was seen from that time to decline gradually in ...health and spirits.

...Against the close of 1601, she fell into a deep hypo...chondria or melancholy. She could scarcely be induced ...to dress herself dressed, and at length became so much ...affected by her sorrow as to refuse sustenance, and ...sat days and nights on the floor, supported by a few ...cushions brought to her by her attendants. On the ...24th of March 1603, she expired, after a reign of nearly ...forty-five years, during which England advanced from ...the condition of a second-rate to that of a first-rate ...power, and the Protestant religion was established on ...a basis from which it could never afterwards be ...overthrown.

The reign of Elizabeth saw the commencement of the naval glory of England. Down to the reign of Henry VII., there was no such thing as a navy belonging to the public, and the military genius of the people was devoted exclusively to enterprises by land. The rise, however, of a commercial spirit in Europe, which in 1492 had caused the discovery of America, and was again acted upon by the scope for adventure which that discovery opened up, had latterly caused great attention to be paid to nautical affairs in England. Englishmen of all ranks supported and entered into enterprises for discovering unknown territories; and under Drake, Cavendish, Raleigh, and Frobisher, various expeditions of less or more magnitude were sent out. The colonies of North America were now commenced. Amongst the exertions of private merchants, our attention is chiefly attracted by the commencement of the northern whale-fishery, the cod-fishery of Newfoundland, and the less laudable slave-trade in Africa. When hostilities with Spain became more open, the English commanders made many successful attacks upon her colonies in the West Indies, and also upon the fleets of merchant vessels which were employed to carry home the gold, and other almost equally valuable products of the New World, to the Spanish harbours. These attacks were now made in a more systematic manner, and with more effect, as a revenge for the affair of the Armada. It may almost be said that the dominion of Britain over the seas was perfected in one reign; a power which has been of such advantage to the country, both in protecting its commerce and keeping it secure from foreign invasion, that its origin would have conferred everlasting lustre on this period of our history, even although it had not been characterised by any other glorious event.

The chief articles exported from England to the Continent were wool, cloth, lead, and tin: formerly these had been sent in vessels belonging to the Hanse Towns —certain ports of the north of Europe, possessing great privileges—but now English vessels were substituted for this trade. Birmingham and Sheffield were already thriving seats of the hardware manufacture, and Manchester was becoming distinguished for making cottons, rugs, and friezes. Stocking-weaving and the making of sailcloth, serge, and baize, took their rise in this reign. The progress of other arts was much favoured by the bloody persecutions in the Netherlands, which drove into England great numbers of weavers, dyers, cloth-dressers, and silk-throwers. Amongst the wealthier classes, the wearing of handsome apparel and of gold ornaments and jewellery, made a great advance. Coaches were introduced, but for a time thought only fit for the use of ladies. Great improvements were made in the building of houses. Theatrical amusements were begun, and attained great vogue, though only in London. The smoking of tobacco was introduced by Sir Walter Raleigh, who became acquainted with the plant in Virginia. At the end of Elizabeth's reign, the population of London was about 160,000, or a tenth of what it now is; and the whole kingdom probably contained about 5,000,000 of inhabitants.

THE STUARTS.—JAMES I.

The successor of Elizabeth, by birthright, was JAMES VI. OF SCOTLAND (styled JAMES I. OF ENGLAND), who was now arrived at the prime of life, and had been married for some years to the Princess Anne of Denmark, by whom he had two sons, Henry and Charles, and one daughter named Elizabeth. James immediately removed to London, and assumed the government of England, while his native kingdom, though thus united under the same sovereignty, still retained its own peculiar institutions. At the suggestion of the king, who wished to obliterate the distinction of the two countries, the common name of *Great Britain* was now conferred upon them. King James was an oddity in human character. His person was naturally feeble, particularly in the limbs, which were scarcely sufficient to support his weight. He had great capacity for learning, some

pose of putting down the Independent party, now predominant in the English Parliament. With some difficulty the Duke of Hamilton and others, who conducted this negotiation, succeeded, by a vote of the Scottish Parliament, in raising an army of 12,000 men, with which they invaded England in the summer of 1648. The more zealous of the clergy and people of Scotland protested against an enterprise, which, from its co-operating with Royalists and Episcopalians, and not perfectly ensuring the ascendancy of the Presbyterian Church, appeared to them as neither deserving of success nor likely to command it. As the Scottish army penetrated the western counties, parties of Presbyterians and Royalists rose in different parts of England, and for some time the ascendancy of the Independents seemed to be in considerable peril. But before the forces of the enemy could be brought together, Cromwell, with 8000 veteran troops, attacked and overthrew Hamilton at Preston, while Fairfax put down the insurgents in Kent and Essex. Hamilton was himself taken prisoner, and very few of his troops ever returned to their own country.

While Cromwell was employed in suppressing this insurrection, and in restoring a friendly government in Scotland, the Presbyterians of the House of Commons, relieved from military intimidation, entered upon a new negotiation with Charles, which was drawing towards what appeared a successful conclusion—though the king secretly designed to deceive them, and to pursue other means for an effectual restoration—when the army returned to London, breathing vengeance against him for this last war, of which they considered him as the author. Finding the Parliament in the act of voting his concessions to be satisfactory, Cromwell sent two regiments, under Colonel Pride, who forcibly excluded from it about two hundred members of the Presbyterian party; a transaction remembered by the epithet of *Pride's Purge*. The remainder, being chiefly Independents, were ready to give a colour of law to whatever further measure might be dictated by the military leaders. Convinced of the utter faithlessness of the king, and that, if he continued to live, he would take the earliest opportunity of revenging himself for what had already been done, Cromwell and his associates resolved to put him to death. A High Court of Justice, as it was called, was appointed by ordinance, consisting of a hundred and thirty-three persons, named indifferently from the Parliament, the army, and such of the citizens as were known to be well affected to the Independent party. This body sat down in Westminster Hall (January 20, 1649), under the presidency of a barrister named Bradshaw, while another named Coke acted as solicitor for the people of England. Charles, who had been removed to St James's Palace, was brought before this court, and accused of having waged and renewed war upon his people, and of having attempted to establish tyranny in place of the limited regal power with which he had been intrusted. He denied the authority of the court, and protested against the whole of the proceedings, but was nevertheless found guilty and condemned to die. On the 30th of January, he was accordingly beheaded in front of his palace of Whitehall. The people were in general horror-struck at this event; but they were too effectually kept in check by the army to have any influence in preventing it.

Charles I. was a man of slender person, of the middle size, and of a grave and somewhat melancholy cast of countenance. He had not a gracious manner, but possessed considerable dignity. He was sincerely attached to the Church of England, for which he might be considered as a martyr, and he was able to reason very acutely in favour of the divine origin of Episcopacy. The general opinion of modern times respecting his political conduct is unfavourable; though few deny that his death was a most disgraceful as well as imprudent act, on the part of those who brought it about. The worst point of his character was his insincerity; he was prone to using equivocations, with a view to deceive his opponents, and therefore no enemy could depend upon him in negotiation. In private life he was a virtuous man, and he is entitled to much credit for the taste which he displayed in the encouragement of the fine arts. He left three sons—Charles, Prince of Wales; James, Duke of York, afterwards James II.; and Henry, Duke of Gloucester, who died in early life. He also left several daughters, one of whom, named Elizabeth, was treated with much harshness by the new government, and died not long after him in prison.

In the reign of Charles I., the chief literary men were Ben Jonson and Philip Massinger, dramatists, and Samuel Daniel, Michael Drayton, and William Drummond, poets. The most eminent philosophical character was Dr William Harvey, who discovered the circulation of the blood. Elegant architecture was now for the first time introduced into private buildings. The king patronised the Dutch artists, Rubens and Vandyke, and collected many fine pictures, which were afterwards sold by his enemies. The excise and the tax upon landed property were introduced by the Parliament, in order to support the war against the king. When the Parliamentary party became triumphant, it suppressed the theatre, which was not again set up till the restoration of monarchy.

THE COMMONWEALTH.—SUBJUGATION OF IRELAND AND SCOTLAND.

Though the execution of the king produced a considerable reaction in favour of royalty, the small remaining part of the House of Commons, which got the ridiculous nickname of the *Rump*, now established a republic, under the title of the Commonwealth, the executive being trusted, under great limitations, to a council of forty-one members, while in reality Cromwell possessed the chief influence. The House of Peers was voted a grievance, and abolished, and the people were declared to be the legitimate source of all power. Soon after the king's death, the Duke of Hamilton, and a few other of his chief adherents, were executed.

During the progress of the civil war, Ireland had been the scene of almost ceaseless contention among the various parties of the King, the English House of Commons, and the Catholics, none of which could effectually suppress the rest. The most remarkable event was a secret agreement which Charles made, in 1646, with the Earl of Glamorgan, to establish the Catholic religion in Ireland, on condition that its partisans should assist him in putting down his enemies in England and Scotland; a transaction which ultimately injured his reputation, without leading to any solid advantage. At the time of his execution, the Royalists were in considerable strength under the Duke of Ormond, while Hugh O'Neill was at the head of a large party of Catholics, who were not indisposed to join the other party, provided they could be assured of the establishment of their religion. While the two parties in union could have easily rescued the country from the English connexion, Cromwell landed (August 1649) with 12,000 horse and foot, and, in a series of victories over the scattered forces of his various opponents, succeeded without any great difficulty in asserting the sway of the Commonwealth. One of his most important actions was the capture of Drogheda, where he put the garrison and a number of Catholic priests to the sword, in order to strike terror into the nation.

The people of Scotland, who had had scarcely any other object in the civil war than the establishment of their favourite form of worship, and were sincere friends to a limited monarchy, heard of the death of the king with the greatest indignation, and immediately proclaimed his eldest son Charles. Early in 1650, the young monarch, who had taken refuge in Holland, sent Montrose with a small force to attempt a Cavalier insurrection in Scotland; but this nobleman being taken and put to death, Charles found it necessary to accede to the views of the Scots respecting the Presbyterian religion, and he was accordingly brought over and put at the head of a considerable army, though under great

restrictions. Cromwell, who had now nearly completed the conquest of Ireland, lost no time in returning to London, and organising an army for the suppression of this new attempt against the Commonwealth.

On the 19th of July he crossed the Tweed, and advanced through a deserted country to Edinburgh, where the Scottish army lay in a fortified camp. Sickness in his army, and the want of provisions, soon after compelled him to retreat; and the Scottish army, following upon his rear, brought him into a straitened position near Dunbar, where he would soon have been under the necessity of surrendering. In the midst of his perplexities (September 3), he beheld the Scots advancing from the neighbouring heights to give him battle, and, in a transport of joy, exclaimed, "The Lord hath delivered them into our hands!" The movement was solely the result of interference on the part of the clergy who followed the Scottish camp: the better sense of General Leslie would have waited for the voluntary surrender of his enemy. In the fight which ensued, the veteran troops of Cromwell soon proved victorious. The Scots fled in a panic, and were cut down in thousands by their pursuers. This gained for Cromwell the possession of the capital and of all the south-east provinces; but the Covenanters still made a strong appearance at Stirling.

Cromwell spent a whole year in the country, vainly endeavouring to bring on another action. During the interval (January 1, 1651), the Scots crowned the young king at Scone, part of the ceremony consisting in his acceptance of the Solemn League and Covenant. In the ensuing summer, Cromwell at length contrived to outflank the position of the Scottish army; but the result was, that Charles led his troops into England without opposition, and made a very threatening advance upon the capital. Ere the Royalists had time to rally around him, Cromwell overtook the king at Worcester, where, after a stoutly contested fight (September 3, 1651), he proved completely victorious. Charles, with great difficulty, escaped abroad, and Scotland, no longer possessed of a military force to defend itself, submitted to the conqueror. All the courts of the Scottish church were suppressed, and the ministers were left no privilege but that of preaching to their flocks. The country was kept in check by a small army under General Monk, and in a short time was declared by proclamation to be united with England. Thus was the Independent party, or rather Cromwell, left without a single armed enemy. All the efforts of the people during twelve years to obtain limitations upon the monarchy, had ended in a military despotism.

THE PROTECTORATE.

After the country and its dependencies had been thoroughly settled under the new government, the republican leaders resolved upon commencing hostilities against Holland, which, during the civil war, had manifested a decided leaning towards the king, and had recently treated the triumphant party with marked disrespect. In the summer of 1652, the Dutch fleet, under its famous commanders, Van Tromp, De Ruyter, and De Witt, had several encounters with the English ships, under Admirals Blake and Ayscue, without any decided success on either side. But, in the ensuing spring, an action was fought between Blake and Van Tromp, in which the latter lost eleven ships. The Dutch then sued for peace, which the Rump Parliament, for various reasons, were little inclined to grant. Their principal motive for prosecuting the war, was a conviction that it tended to restrict the power of Cromwell, to whom they now paid by no means a willing obedience. Cromwell, perceiving their design, proceeded with 300 soldiers to the house (April 1653), and entering with marks of the most violent indignation, loaded the members with reproaches for their robbery and oppression of the public; then, stamping with his foot, he gave signal for the soldiers to enter, and, addressing himself to the members, "For shame!" said he; "get you gone! give place to honester men! I tell you you are no longer a Parliament; the Lord has done with you!" He then commanded "that bauble," meaning the mace, to be taken away, turned out the members, and, locking the door, returned to Whitehall with the key in his pocket.

Being still willing to keep up the appearance of a representative government, Cromwell summoned one hundred and forty-four persons in England, Ireland, and Scotland, to assemble as a parliament. These individuals, chiefly remarkable for fanaticism and ignorance, were denominated the *Barebones Parliament*, from the name of one of the members, a leather-seller, whose assumed name, by a ridiculous usage of the age, was Praise-God Barebones. As the assembly obtained no public respect, Cromwell took an early opportunity of dismissing it. His officers then constituted him PROTECTOR of the Commonwealth of Great Britain and Ireland, with most of the prerogatives of the late king.

The war against Holland was still carried on with great spirit. In the summer of 1653, two naval actions, in which both parties fought with the utmost bravery, terminated in the triumph of the English, and the complete humiliation of the Dutch, who obtained peace on the condition of paying homage to the English flag, expelling the young king from their dominions, and paying a compensation for certain losses to the East India Company. In a war which he subsequently made against Spain, the fleets of the protector performed some exploits of not less importance. The respect which he thus gained for the English name throughout Europe, is one of the brightest points in his singular history. But while generally successful abroad, he experienced unceasing difficulties in the management of affairs at home. Of the various parliaments which he summoned, no one was found so carefully composed of his own creatures as to yield readily to his will: he was obliged to dissolve them all in succession, after a short trial. He also experienced great difficulty in raising money, and sometimes applied for loans in the city without success. His own officers could scarcely be kept in subordination, but were constantly plotting a reduction of his authority. The Royalists, on the other hand, never ceased to conspire for his destruction; one, named Colonel Titus, went so far as to recommend his assassination in a pamphlet entitled "Killing no Murder," after reading which he was never seen again to smile.

The last Parliament called by Cromwell, was in January 1656; when, besides the commons, he summoned the few remaining peers, and endeavoured, by ennobling some of his officers, to make up a kind of Upper House. This assembly proved as intractable as its predecessors, and he contracted such a disgust at the very nature of a representative legislature, as to resolve, like Charles I., never to call another. His health finally sank under the effects of his ill-gotten power, and he died on the 3d September 1658, a day which was thought to be propitious to him, as it was the anniversary of several of his victories. His eldest son Richard, a weak young man, succeeded him as protector, and was at first treated with all imaginable respect; but he could not long maintain a rule which even his father had ultimately failed in asserting. He quietly slunk out of public view, leaving the supreme authority in the hands of the Rump, which had taken the opportunity to re-assemble.

THE RESTORATION.—DUTCH WAR.

This remnant of an old Parliament continued in power till the autumn of 1659, when it gave way to a council of the officers who had been in command under Cromwell. The latter government, in its turn, yielded to the Rump, which sat down once more in December. The people, finding themselves made the sport of a few ambitious adventurers, began to long for some more fixed and respectable kind of government. At this crisis, General Monk, commander of the forces in Scotland, conceived the design of settling the nation. He left Scotland (January 2, 1660), with a considerable army; and though he kept his thoughts scrupulously to himself, all men bent their eyes upon him, as a person destined to realise their hopes. He reached Lon-

don (February 3), and was received with feigned respect by the Rump. Some resistance was attempted by Lambert, one of Cromwell's officers, but in vain. Ere long, Monk was able to procure the restoration of the members who had been excluded from Parliament by Cromwell; who, being a majority, gave an immediate ascendancy to anti-republican views. As soon as this was effected, an act was passed for calling a new and freely elected Parliament; after which, the existing assembly immediately dissolved itself.

The new Parliament proved to be chiefly composed of Cavaliers and Presbyterians, men agreeing in their attachment to monarchy, though differing in many other views. After some cautious procedure, in which the fears inspired by the late military tyranny were conspicuous, they agreed to invite the king from his retirement in Holland, and to restore him to the throne lost by his father. They were so glad to escape from the existing disorders, that they never thought of making any preliminary arrangement with the king as to the extent of his prerogative. On the 29th of May, being his thirtieth birth-day, Charles II. entered London amidst such frantic demonstrations of joy, that he could not help thinking it his own fault, as he said, that he had been so long separated from his people.

One of the first measures of the new monarch was the passing of a bill of indemnity, by which all persons concerned in the late popular movements were pardoned, excepting a few who had been prominently concerned in bringing the king to the block. Harrison, Scrope, and a few other regicides, were tried and executed; and the bodies of Cromwell, Ireton, and Bradshaw, were raised from the grave and exhibited upon gibbets. In Scotland only three persons suffered—the Marquis of Argyle, Johnston of Warriston, and Mr Guthry, a clergyman: it was considered remarkable, that the marquis had placed the crown upon the king's head at Scone in the year 1651. Excepting in these acts, the king showed no desire of revenging the death of his father, or his own exclusion from the throne. The Parliament which called him home was constituted a legal one by his own ratification of an act for that purpose. In the settlement of other matters, it seemed the prevailing wish that all the institutions of the country should be made as nearly what they were before the civil war as possible. Thus the Episcopal Church was established both in England and Scotland, though not without causing about a third of the clergy in both countries to resign their charges. The stern and enthusiastic piety which prevailed during the civil war, was now treated with ridicule, and the most of the people vied with each other in that licentious riot and drunkenness which is condemned by all systems of faith. The nation, in fact, seemed intoxicated with the safety which they supposed themselves to have at length gained, in a restoration to the imperfect freedom they enjoyed before the civil war.

Ireland, which, during the Protectorate, had been managed by Henry, a younger son of Cromwell, acceded to the Restoration with as much readiness as any other part of the British dominions. An act was passed for settling property, by which the Catholics obtained some slight benefits, but which, in its main effects, confirmed the rights of the settlers introduced by Cromwell.

Though Charles had been restored with the approbation of a very large portion of his subjects, his most zealous friends were the Royalists and Episcopalians; hence he almost immediately subsided into the character of a party ruler. It was deemed necessary that he should maintain an armed force for the protection of his person, and to keep down popular disturbances. He therefore caused several horse regiments to be embodied under the name of Life Guards, being chiefly composed of Royalist gentlemen upon whom a perfect dependence could be placed; and he afterwards added two or three foot regiments, the whole amounting to about five thousand men. The king paid these troops chiefly out of the money allowed for his own support, for Parliament did not sanction his keeping u force, and the nation generally beheld it with s This was the commencement of a *standing* England.

Personally indolent, dissolute, and deficient scientiousness, and surrounded almost exclus the ministers of the basest pleasures, Charles qualified to retain the sincere respect of a peop habitual character is grave and virtuous. H vagant expenditure soon cooled the affectio Parliament, and he began to find considera culties in obtaining money. To relieve hims this embarrassment, he accepted £40,000 f French king for Dunkirk, a French port wl been acquired by Cromwell. For the same pur married a Portuguese princess of the Catholic who possessed a dowry of half a million. He a menced (1664) a war against Holland, for ap no better reason than that, in applying the mentary subsidies necessary for keeping up h he might have an opportunity of converting pa money to his own personal use.

This Dutch war was chiefly conducted by a the 3d of June 1665, an English fleet of 114 sa Dutch one which numbered just one ship le Lowestoffe, and after an obstinate fight gaine plete victory, depriving the enemy of eighteen and compelling the rest to take refuge on th coast. The commander on this occasion was t of York, the king's younger brother; a man of application and more steady principles, but w after became unpopular, in consequence of his himself a Catholic.

Some other well-contested actions took plac and the English, upon the whole, confirmed the supremacy. Owing, however, to a failure of plies, the king was obliged to lay up his best v ordinary, and to send only an inferior force to Dutch took advantage of this occurrence to sen up the Thames (June 10, 1667), which, meeti no adequate resistance, threatened to lay the c ruins and destroy its shipping. Fortunately, th admiral did not think it expedient to make this but retired with the ebb of the tide, after havi and burnt nearly twenty vessels, and done mu damage. The king, finding himself rather impo than enriched by the war, soon after concluded

PLAGUE AND FIRE OF LONDON.—PERSECUTION IN S

In the mean time, two extraordinary calami befallen the metropolis. In the summer of 16 don was visited by a plague, which swept o 100,000 people, and did not experience any ab till the approach of cold weather. On this the city presented a wide and heart-rending s misery and desolation. Rows of houses stood te and open to the winds; the chief thoroughfa overgrown with grass. The few individuals w tured abroad, walked in the middle of the stre when they met, declined on opposite sides, to a contact of each other. At one moment were h ravings of delirium, or the wail of sorrow, f infected dwelling; at another, the merry song less laugh from the tavern, where men were se drown in debauchery all sense of their awful s Since 1665, the plague has not again occurred don, or in any other part of the kingdom.

The second calamity was a conflagration, whi menced on the night of Sunday the 2d of Sep 1666, in the eastern and more crowded part of The direction and violence of the wind, the com nature of the houses, and the defective arran of that age for extinguishing fires, combined t the progress of the flames, which raged dur whole of the week, and burnt all that part of which lies between the Tower and the Temple. calamity, 13,200 houses and 89 churches, cov all 430 acres of ground, were destroyed. The spirit of retaliation was ...ious, and political wrongs, unfeelingly inflicted, were, ...often the case, ferociously avenged. The massacre ...e immense number of Protestants held forth an ...ful lesson of the effects which oppressive laws pro...e on the human passions. The government rather ...rravated than alleviated the evil, by offering the ...ge of all in rebellion to those who should aid in ...ring them to obedience. This drove the insurgents ...desperation, and *postponed the complete extinction* of the war for several years. It is to be remarked, that, though the Irish were struggling for both national and religious freedom, they gained no sympathy from the patriots of Britain, who, on the contrary, urged the king to suppress the rebellion, being afraid that a religious toleration in Ireland would be inconsistent with the same privilege in their own country. The Scottish Covenanters, themselves so recently emancipated from a restraint upon their consciences, contributed ten thousand troops to assist in restoring that restraint upon the Irish.

THE CIVIL WAR.

It was generally allowed by moderate people, that in the autumn of 1641, at which time the labours of the Parliament had continued one year, the king had granted redress of all the abuses for which the earlier part of his reign, and the British constitution in general, were blameable. Unfortunately, the character of the king for fidelity to his engagements was not sufficiently high to induce the leaders of the House of Commons to depend upon him: they feared that, if they once permitted him to resume his authority, there would be no longer any safety for them; and they deemed it necessary that things should be prevented from falling into their usual current. They therefore prepared a paper called *The Remonstrance*, containing an elaborate view of all the grievances that had ever existed, or could now be supposed to exist; and this they not only presented to the king, but disseminated widely among the people, with whom it served to increase the prevailing disaffection.

From this time it was seen that the sword could alone decide the quarrel between the king and the Parliament. Charles made an unsuccessful attempt (January 4, 1642) to seize six of the most refractory members, for the purpose of striking terror into the rest. This served to widen the breach. In the early part of 1642, the two parties severally employed themselves in preparing for war. Yet, even now, the king granted some additional concessions to his opponents. It was at last, upon a demand of the Parliament for the command of the army—a privilege always before and since resting with the crown—that he finally broke off all amicable intercourse. He retired with his family to York.

The Parliament found its chief support in the mercantile classes of London and of the eastern coast of England, which was then more devoted to trade than the west, and in the Puritan party generally, who were allied intimately with the Presbyterians of Scotland, if not rapidly becoming assimilated with them. Charles, on the other hand, looked for aid to the nobility and gentry, who were able to bring a considerable number of dependants into the field. The Parliamentary party was by the other styled *Roundheads*, in consequence of their wearing short hair; while the friends of the Parliament bestowed upon their opponents the epithet of *Malignants*. The Royalists were also, in the field, termed Cavaliers, from so many of them being horsemen.

On the 25th of August the king erected his standard at Nottingham, and soon found himself at the head of an army of ten thousand men. The Parliament had superior forces, and a better supply of arms; but both parties were very ignorant of the art of war. The king commanded his own army in person, and the Parliamentary forces were put under the charge of the Earl of Essex.

The first battle took place, October 23, at Edgehill, in Warwickshire, where the king had rather the advantage, though at the expense of a great number of men. He gained some further triumphs before the end of the campaign, but still could not muster so large an army as the Parliament. During the winter, the parties opened a negotiation at Oxford; but the demands of the Parliament being still deemed too great by the king, it came to no successful issue.

Early in the ensuing season, the king gained some

don (February 3), and was received with feigned respect by the Rump. Some resistance was attempted by Lambert, one of Cromwell's officers, but in vain. Ere long, Monk was able to procure the restoration of the members who had been excluded from Parliament by Cromwell; who, being a majority, gave an immediate ascendancy to anti-republican views. As soon as this was effected, an act was passed for calling a new and freely elected Parliament; after which, the existing assembly immediately dissolved itself.

The new Parliament proved to be chiefly composed of Cavaliers and Presbyterians, men agreeing in their attachment to monarchy, though differing in many other views. After some cautious procedure, in which the fears inspired by the late military tyranny were conspicuous, they agreed to invite the king from his retirement in Holland, and to restore him to the throne lost by his father. They were so glad to escape from the existing disorders, that they never thought of making any preliminary arrangement with the king as to the extent of his prerogative. On the 29th of May, being his thirtieth birth-day, Charles II. entered London amidst such frantic demonstrations of joy, that he could not help thinking it his own fault, as he said, that he had been so long separated from his people.

One of the first measures of the new monarch was the passing of a bill of indemnity, by which all persons concerned in the late popular movements were pardoned, excepting a few who had been prominently concerned in bringing the king to the block. Harrison, Scrope, and a few other regicides, were tried and executed; and the bodies of Cromwell, Ireton, and Bradshaw, were raised from the grave and exhibited upon gibbets. In Scotland only three persons suffered—the Marquis of Argyle, Johnston of Warriston, and Mr Guthry, a clergyman: it was considered remarkable, that the marquis had placed the crown upon the king's head at Scone in the year 1651. Excepting in these acts, the king showed no desire of revenging the death of his father, or his own exclusion from the throne. The Parliament which called him home was constituted a legal one by his own ratification of an act for that purpose. In the settlement of other matters, it seemed the prevailing wish that all the institutions of the country should be made as nearly what they were before the civil war as possible. Thus the Episcopal Church was established both in England and Scotland, though not without causing about a third of the clergy in both countries to resign their charges. The stern and enthusiastic piety which prevailed during the civil war, was now treated with ridicule, and the most of the people vied with each other in that licentious riot and drunkenness which is condemned by all systems of faith. The nation, in fact, seemed intoxicated with the safety which they supposed themselves to have at length gained, in a restoration to the imperfect freedom they enjoyed before the civil war.

Ireland, which, during the Protectorate, had been managed by Henry, a younger son of Cromwell, acceded to the Restoration with as much readiness as any other part of the British dominions. An act was passed for settling property, by which the Catholics obtained some slight benefits, but which, in its main effects, confirmed the rights of the settlers introduced by Cromwell.

Though Charles had been restored with the approbation of a very large portion of his subjects, his most zealous friends were the Royalists and Episcopalians; hence he almost immediately subsided into the character of a party ruler. It was deemed necessary that he should maintain an armed force for the protection of his person, and to keep down popular disturbances. He therefore caused several horse regiments to be embodied under the name of Life Guards, being chiefly composed of Royalist gentlemen upon whom a perfect dependence could be placed; and he afterwards added two or three foot regiments, the whole amounting to about five thousand men. The king paid these troops chiefly out of the money allowed for his own support, for Parliament did not sanction his keeping u force, and the nation generally beheld it with s This was the commencement of a *standing* England.

Personally indolent, dissolute, and deficient scientiousness, and surrounded almost exclus the ministers of the basest pleasures, Charles qualified to retain the sincere respect of a peop habitual character is grave and virtuous. H vagant expenditure soon cooled the affection Parliament, and he began to find considera culties in obtaining money. To relieve hims this embarrassment, he accepted £40,000 f French king for Dunkirk, a French port wl been acquired by Cromwell. For the same pur married a Portuguese princess of the Catholic who possessed a dowry of half a million. He a menced (1664) a war against Holland, for ap no better reason than that, in applying the mentary subsidies necessary for keeping up hc he might have an opportunity of converting pa money to his own personal use.

This Dutch war was chiefly conducted by s the 3d of June 1665, an English fleet of 114 sa Dutch one which numbered just one ship le Lowestoffe, and after an obstinate fight gaine plete victory, depriving the enemy of eighteen and compelling the rest to take refuge on th coast. HISTORY OF GREAT BRITAIN AND IRELAND,

FROM THE YEAR 1603 TILL THE PEACE OF 1763.

CONCLUSION OF THE CIVIL WAR.

...English campaign of 1645 ended in the complete ...ilure of the king. Throughout the war, his army had been continually improving in discipline, in ...dred, and in that enthusiasm which animated them ...rgely, while the royalists had become, out of a mere ...pirit of opposition, so extremely licentious, as to be ...ore a terror to their friends than to their enemies. ...e new-modelling of the parliamentary army, which ...k place early in 1645, had also added much to the ...fficiency of the troops, who were now nominally ...mmanded by Sir Thomas Fairfax, but in reality by ...ir Cromwell, who bore the rank of lieutenant-gene...

The consequence was, that, in a pitched battle at ...ry (June 14), the king was so completely beaten, ...t he and his party could no longer keep the field. ...ad no resource but to retire into Oxford, a town ...ongly affected to his cause, and well fortified. ...e endeavoured, from this forlorn position, to renew ...negotiations for a peace; but every attempt of that ...d was frustrated by the Independents, who, though ...inority in the House of Commons, possessed great ...ce through the army, and, as already mentioned, ...e desirous of effecting greater changes in church ...state than those for which the war was originally ...rtaken. Dreading the influence of this body, Charles ...ped privately from Oxford (May 1646) on the ap...ach of the parliamentary forces, and put himself ...er the protection of the Scottish army at Newark. ...e the views of the Scots throughout the war had ...n steadily confined to the security of the Presbyte...n religion, along with the safety of the king's per...nd the establishment of a limited monarchy, they ...ived him with great respect at their camp, and ...ered into negotiations for effecting their grand ...ct. If Charles would have acceded to their views, ...ight have immediately resumed a great part of ...former power; and the agitations of many subse...nt years, as well as his own life, might have been ...ved. But this was forbidden, not only by his strong ...ossession in favour of the Episcopal forms of wor..., but also by his conviction that the Episcopal form ...church government was alone compatible with the ...tence of monarchy. He therefore disagreed with ...Presbyterians on the very point which they consi...ed the most important.

From the time when Charles first threw himself into ...Scottish camp, the English Parliament had made ...ated and strenuous demands for the surrender of ...person into their hands. The Scots, however, ...ugh acting partly as a mercenary army, asserted ...ir right, as an independent nation under the autho...y of the king, to retain and protect him. At length, ...spairing of inducing him to sanction the Presbyterian ...m, and tempted by the *sum of £100,000, which was* ...en to them *as a compensation for their* arrears of pay, they consented to deliver up their monarch, but certainly without any apprehension of his life being in danger, and, indeed, to a party quite different from that by which he afterwards suffered. The Scottish army then retired (January 1647) to their native country, and were dismissed.

The king was now placed in Holdenby Castle, and negotiations were opened for restoring him to power, under certain restrictions. While these were pending, the Parliament deemed it unnecessary to keep up the army, more especially as its spirit was plainly observed to be of a dangerous character. On attempting, however, to dismiss this powerful force, the English Commons found that their late servants were become their masters. The troops began to hold something like a Parliament in their own camp; a party of them, under Cornet Joyce, seized the king's person, and brought him to Hampton Court. Cromwell, who was at the bottom of their machinations, received from them the chief command; and, at his instigation, they retorted upon the Parliament with a demand for the dismissal of the leaders of the Presbyterian party, and a general right of new-modelling the government and settling the nation. The House of Commons, supported by the city of London, made a bold opposition to these demands, but was obliged to yield to a force which it had no means of resisting. From that time military violence exercised an almost uncontrolled mastery over England.

TRIAL AND EXECUTION OF THE KING.

The leaders of the army, being anxious to fortify themselves by all possible means against the Presbyterians, opened a negotiation with the king, whose influence, such as it now was, they proposed to purchase, by allowing Episcopacy to be the state religion, and leaving him in command of the militia. Charles, however, with characteristic insincerity, carried on at the same time a negotiation with the Presbyterians, which, being discovered by the military chiefs, caused them to break off all terms with him. Under dread of their resentment, he made his escape from Hampton Court (November 11, 1647), and, after an unsuccessful attempt to leave the kingdom, was obliged to put himself under the charge of the governor of Carisbrooke Castle, in the Isle of Wight. Here he entered upon a new negotiation with the House of Commons, to whom he made proposals, and from whom he received proposals in return; all of which were, however, rendered vain by a secret treaty which he at the same time carried on with a moderate party of the Scottish Presbyterians.

He finally agreed with the latter party, but under strict secrecy, to give their form of church government a trial of three years, and yield to them in several other points; they in return binding themselves to unite their strength with the English Royalists, for the res-

don (February 3), and was received with feigned respect by the Rump. Some resistance was attempted by Lambert, one of Cromwell's officers, but in vain. Ere long, Monk was able to procure the restoration of the members who had been excluded from Parliament by Cromwell; who, being a majority, gave an immediate ascendancy to anti-republican views. As soon as this was effected, an act was passed for calling a new and freely elected Parliament; after which, the existing assembly immediately dissolved itself.

The new Parliament proved to be chiefly composed of Cavaliers and Presbyterians, men agreeing in their attachment to monarchy, though differing in many other views. After some cautious procedure, in which the fears inspired by the late military tyranny were conspicuous, they agreed to invite the king from his retirement in Holland, and to restore him to the throne lost by his father. They were so glad to escape from the existing disorders, that they never thought of making any preliminary arrangement with the king as to the extent of his prerogative. On the 29th of May, being his thirtieth birth-day, Charles II. entered London amidst such frantic demonstrations of joy, that he could not help thinking it his own fault, as he said, that he had been so long separated from his people.

One of the first measures of the new monarch was the passing of a bill of indemnity, by which all persons concerned in the late popular movements were pardoned, excepting a few who had been prominently concerned in bringing the king to the block. Harrison, Scrope, and a few other regicides, were tried and executed; and the bodies of Cromwell, Ireton, and Bradshaw, were raised from the grave and exhibited upon gibbets. In Scotland only three persons suffered—the Marquis of Argyle, Johnston of Warriston, and Mr Guthry, a clergyman: it was considered remarkable, that the marquis had placed the crown upon the king's head at Scone in the year 1651. Excepting in these acts, the king showed no desire of revenging the death of his father, or his own exclusion from the throne. The Parliament which called him home was constituted a legal one by his own ratification of an act for that purpose. In the settlement of other matters, it seemed the prevailing wish that all the institutions of the country should be made as nearly what they were before the civil war as possible. Thus the Episcopal Church was established both in England and Scotland, though not without causing about a third of the clergy in both countries to resign their charges. The stern and enthusiastic piety which prevailed during the civil war, was now treated with ridicule, and the most of the people vied with each other in that licentious riot and drunkenness which is condemned by all systems of faith. The nation, in fact, seemed intoxicated with the safety which they supposed themselves to have at length gained, in a restoration to the imperfect freedom they enjoyed before the civil war.

Ireland, which, during the Protectorate, had been managed by Henry, a younger son of Cromwell, acceded to the Restoration with as much readiness as any other part of the British dominions. An act was passed for settling property, by which the Catholics obtained some slight benefits, but which, in its main effects, confirmed the rights of the settlers introduced by Cromwell.

Though Charles had been restored with the approbation of a very large portion of his subjects, his most zealous friends were the Royalists and Episcopalians; hence he almost immediately subsided into the character of a party ruler. It was deemed necessary that he should maintain an armed force for the protection of his person, and to keep down popular disturbances. He therefore caused several horse regiments to be embodied under the name of Life Guards, being chiefly composed of Royalist gentlemen upon whom a perfect dependence could be placed; and he afterwards added two or three foot regiments, the whole amounting to about five thousand men. The king paid these troops chiefly out of the money allowed for his own support, for Parliament did not sanction his keeping u force, and the nation generally beheld it with s This was the commencement of a *standing* England.

Personally indolent, dissolute, and deficient scientiousness, and surrounded almost exclus the ministers of the basest pleasures, Charles qualified to retain the sincere respect of a peop habitual character is grave and virtuous. H vagant expenditure soon cooled the affection Parliament, and he began to find considera culties in obtaining money. To relieve hims this embarrassment, he accepted £40,000 f French king for Dunkirk, a French port wh been acquired by Cromwell. For the same pur married a Portuguese princess of the Catholic who possessed a dowry of half a million. He a menced (1664) a war against Holland, for ap no better reason than that, in applying the mentary subsidies necessary for keeping up ho he might have an opportunity of converting pa money to his own personal use.

The country ...kept in check by a small army under General Monk, ...in a short time was declared by proclamation to ...nited with England. Thus was the Independent ..., or rather Cromwell, left without a single armed ...y. All the efforts of the people during twelve ... to obtain limitations upon the monarchy, had ended ...military despotism.

THE PROTECTORATE.

...fter the country and its dependencies had been ...roughly settled under the new government, the re...can leaders resolved upon commencing hostilities ...st Holland, which, during the civil war, had mani...ed a decided leaning towards the king, and had re...ly treated the triumphant party with marked dis...ect. In the summer of 1652, the Dutch fleet, under ...mous commanders, Van Tromp, De Ruyter, and ...Witt, had several encounters with the English ships, ...er Admirals Blake and Ayscue, without any decided ...ess on either side. But, in the ensuing spring, an ...n was fought between Blake and Van Tromp, in ...ch the latter lost eleven ships. The Dutch then ...for peace, which the Rump Parliament, for various ...ons, were little inclined to grant. Their principal ...ve for prosecuting the war, was a conviction that ...ended to restrict the power of Cromwell, to whom ...now paid by no means a willing obedience. Crom..., perceiving their design, proceeded with 300 soldiers ...e house (April 1653), and entering with marks of ...most violent indignation, loaded the members with ...roaches for their robbery and oppression of the ...ple; then, stamping with his foot, he gave signal for ...soldiers to enter, and, addressing himself to the ...bers, "For shame!" said he; "get you gone! give ...e to honester men! I tell you you are no longer ...a Parliament; the Lord has done with you!" He then ...commanded "that bauble," meaning the mace, to be ...taken away, turned out the members, and, locking the ...door, returned to Whitehall with the key in his pocket.

Being still willing to keep up the appearance of a representative government, Cromwell summoned one hundred and forty-four persons in England, Ireland, and Scotland, to assemble as a parliament. These individuals, chiefly remarkable for fanaticism and ignorance, were denominated the *Barebones Parliament*, from the name of one of the members, a leather-seller, whose assumed name, by a ridiculous usage of the age, was Praise-God Barebones. As the assembly obtained no public respect, Cromwell took an early opportunity of dismissing it. His officers then nominated him Protector of the Commonwealth of Great Britain and Ireland, with most of the prerogatives of the late king.

The war against Holland was still carried on with great spirit. In the summer of 1653, two naval actions, in which both parties fought with the utmost bravery, terminated in the triumph of the English, and the complete humiliation of the Dutch, who obtained peace on the condition of paying homage to the English flag, expelling the young king from their dominions, and paying a compensation for certain losses to the East India Company. In a war which he subsequently made against Spain, the fleets of the protector performed some exploits of not less importance. The respect which he thus gained for the English name throughout Europe, is one of the brightest points in his singular history. But while generally successful abroad, he experienced unceasing difficulties in the management of affairs at home. Of the various parliaments which he summoned, no one was found so carefully composed of his own creatures as to yield readily to his will: he was obliged to dissolve them all in succession, after a short trial. He also experienced great difficulty in raising money, and sometimes applied for loans in the city without success. His own officers could scarcely be kept in subordination, but were constantly plotting a reduction of his authority. The Royalists, on the other hand, never ceased to conspire for his destruction: one, named Colonel Titus, went so far as to recommend his assassination in a pamphlet entitled "Killing no Murder," after reading which he was never seen again to smile.

The last Parliament called by Cromwell, was in January 1656; when, besides the commons, he summoned the few remaining peers, and endeavoured, by ennobling some of his officers, to make up a kind of Upper House. This assembly proved as intractable as its predecessors, and he contracted such a disgust at the very nature of a representative legislature, as to resolve, like Charles I., never to call another. His health finally sank under the effects of his ill-gotten power, and he died on the 3d September 1658, a day which was thought to be propitious to him, as it was the anniversary of several of his victories. His eldest son Richard, a weak young man, succeeded him as protector, and was at first treated with all imaginable respect; but he could not long maintain a rule which even his father had ultimately failed in asserting. He quietly slunk out of public view, leaving the supreme authority in the hands of the Rump, which had taken the opportunity to re-assemble.

THE RESTORATION.—DUTCH WAR.

This remnant of an old Parliament continued in power till the autumn of 1659, when it gave way to a council of the officers who had been in command under Cromwell. The latter government, in its turn, yielded to the Rump, which sat down once more in December. The people, finding themselves made the sport of a few ambitious adventurers, began to long for some more fixed and respectable kind of government. At this crisis, General Monk, commander of the forces in Scotland, conceived the design of settling the nation. He left Scotland (January 2, 1660), with a considerable army; and though he kept his thoughts scrupulously to himself, all men bent their eyes upon him, as a person destined to realise their hopes. He reached Lon-

don (February 3), and was received with feigned respect by the Rump. Some resistance was attempted by Lambert, one of Cromwell's officers, but in vain. Ere long, Monk was able to procure the restoration of the members who had been excluded from Parliament by Cromwell; who, being a majority, gave an immediate ascendancy to anti-republican views. As soon as this was effected, an act was passed for calling a new and freely elected Parliament; after which, the existing assembly immediately dissolved itself.

The new Parliament proved to be chiefly composed of Cavaliers and Presbyterians, men agreeing in their attachment to monarchy, though differing in many other views. After some cautious procedure, in which the fears inspired by the late military tyranny were conspicuous, they agreed to invite the king from his retirement in Holland, and to restore him to the throne lost by his father. They were so glad to escape from the existing disorders, that they never thought of making any preliminary arrangement with the king as to the extent of his prerogative. On the 29th of May, being his thirtieth birth-day, Charles II. entered London amidst such frantic demonstrations of joy, that he could not help thinking it his own fault, as he said, that he had been so long separated from his people.

One of the first measures of the new monarch was the passing of a bill of indemnity, by which all persons concerned in the late popular movements were pardoned, excepting a few who had been prominently concerned in bringing the king to the block. Harrison, Scrope, and a few other regicides, were tried and executed; and the bodies of Cromwell, Ireton, and Bradshaw, were raised from the grave and exhibited upon gibbets. In Scotland only three persons suffered—the Marquis of Argyle, Johnston of Warriston, and Mr Guthry, a clergyman: it was considered remarkable, that the marquis had placed the crown upon the king's head at Scone in the year 1651. Excepting in these acts, the king showed no desire of revenging the death of his father, or his own exclusion from the throne. The Parliament which called him home was constituted a legal one by his own ratification of an act for that purpose. In the settlement of other matters, it seemed the prevailing wish that all the institutions of the country should be made as nearly what they were before the civil war as possible. Thus the Episcopal Church was established both in England and Scotland, though not without causing about a third of the clergy in both countries to resign their charges. The stern and enthusiastic piety which prevailed during the civil war, was now treated with ridicule, and the most of the people vied with each other in that licentious riot and drunkenness which is condemned by all systems of faith. The nation, in fact, seemed intoxicated with the safety which they supposed themselves to have at length gained, in a restoration to the imperfect freedom they enjoyed before the civil war.

Ireland, which, during the Protectorate, had been managed by Henry, a younger son of Cromwell, acceded to the Restoration with as much readiness as any other part of the British dominions. An act was passed for settling property, by which the Catholics obtained some slight benefits, but which, in its main effects, confirmed the rights of the settlers introduced by Cromwell.

Though Charles had been restored with the approbation of a very large portion of his subjects, his most zealous friends were the Royalists and Episcopalians; hence he almost immediately subsided into the character of a party ruler. It was deemed necessary that he should maintain an armed force for the protection of his person, and to keep down popular disturbances. He therefore caused several horse regiments to be embodied under the name of Life Guards, being chiefly composed of Royalist gentlemen upon whom a perfect dependence could be placed; and he afterwards added two or three foot regiments, the whole amounting to about five thousand men. The king paid these troops chiefly out of the money allowed for his own support, for Parliament did not sanction his keeping up force, and the nation generally beheld it with s This was the commencement of a *standing* England.

Personally indolent, dissolute, and deficient scientiousness, and surrounded almost exclus the ministers of the basest pleasures, Charles qualified to retain the sincere respect of a peop habitual character is grave and virtuous. H vagant expenditure soon cooled the affection Parliament, and he began to find considera culties in obtaining money. To relieve hims this embarrassment, he accepted £40,000 f French king for Dunkirk, a French port wl been acquired by Cromwell. For the same pur married a Portuguese princess of the Catholic who possessed a dowry of half a million. THE TRIPLE ALLIANCE.—THE FRENCH ALLIANCE.

...he kingdom of France was at this period, under ... XIV., rising into a degree of power and wealth ... it had never before known. Louis had some ... through his wife upon the Netherlands (since ... Belgium), which were then part of the Spanish ...minions. He accordingly endeavoured to possess ...self of that country by force of arms. A jealousy ... increasing power, and of the Catholic religion, ...ssed by his people, induced the English to wish ... his aggressions should be restrained. To gratify ..., Charles entered into an alliance with Holland ... Sweden, for the purpose of checking the progress ... French king. In this object he was completely ...ssful, and consequently he became very popular. ... Parliament, however, having disappointed him of ...plies, he soon after entirely changed his policy, and, ... the assistance of five abandoned ministers, Clif..., Ashley, Buckingham, Arlington, and Lauderdale, ... were called the CABAL, from the initials of their ... forming that word, resolved to render himself, ...sible, independent of Parliament; in other words, ...olute prince. In consideration of a large bribe from Louis, he agreed to join France in a war against Holland, with the view of putting an end to that example of a Protestant republic.

War was accordingly declared in May 1672, and the naval force of England was employed in meeting that of the Dutch by sea; while Louis led a powerful army across the Rhine, and in a very short time had nearly reduced the whole of the Seven Provinces. In this emergency, the Dutch could only save themselves from absolute ruin by laying a great part of their country under water. The English, who had not entered heartily into this war, soon began to be alarmed for the fate of Holland, which was almost their only support against the dread of Popery; and though forbidden under severe penalties to censure the government measures, they soon contrived to exhibit so much dissatisfaction, as to render a change of policy unavoidable.

The king found it necessary to assemble his Parliament (February 1673), and it was no sooner met, than it passed some acts highly unfavourable to his designs. Among these was the famous Test Act, so called because it enacted the imposition of a religious oath upon all persons about to enter the public service, the design being to exclude the Catholics from office. Above all things, the House of Commons declared that it would grant no more supplies for the Dutch war. The king resolved to prorogue the assembly; but before he could do so, they voted the alliance with France, and several of his ministers, to be *grievances*. Charles, who, in wishing to be absolute, had been inspired by no other motive than a desire of ease, now saw that there was a better chance of his favourite indulgence in giving way to his subjects than in any other course; and he at once abandoned all his former measures, and concluded a separate peace with Holland. This country was now beginning, under the conduct of the Prince of Orange, to make a good defence against the French, which it was the better enabled to do by obtaining the friendship of Germany and Spain. In the year 1678, after a war, which, without any decisive victories, will ever reflect lustre upon Holland, a peace was concluded. The Prince of Orange, in the previous year, had married the Princess Mary, eldest daughter of the Duke of York, and educated in the reformed faith—an alliance which pleased the English, from its strengthening the Protestant interest, and which was destined, some years after, to bring about important results.

During the whole of this reign the corruptness of the court was very great; but it was, in some measure, the protection of the public. Charles spent vast sums in debauchery, and thus made himself more dependent on his Commons than he would otherwise have been. Many of the Commons were exceedingly corrupt, and all kinds of evil methods were adopted to render them more so. Bribes were distributed among them, and they were frequently *closeted*; that is, brought into the presence of the king individually, and personally solicited for votes. Still a large party maintained its purity and independence, and long kept a majority against the court.

THE POPISH PLOT.

For a century past, one of the grand moving-springs of the public conduct had been a strong detestation and dread of the adherents of the Romish church. This sentiment did not arise from any fear of the numbers or political strength of the Catholics, for they were but a small minority of the nation, but from a belief, generally entertained, that the Catholics scrupled at no treachery or cruelty which might seem favourable to the re-establishment of their religion. The popular notions, newly inflamed by the avowed Catholicism of the Duke of York, heir-presumptive to the crown, and by the late intrigues of the king with France, were encouraged by a party who wished to impose restrictions upon the royal prerogative, and to exclude the duke from the succession. In 1678, an account of a plot, supposed to have been formed by the Papists, for burning London, massacring the Protestants, and de-

[illegible] and the Protestant religion, was [illegible] the Duke a Romish [illegible], a weak, irresolute person, and [illegible] one of the most [illegible] that ever appeared in history. The [illegible] [illegible] [illegible]

lived, in the event of its not proving more tractable, the advantage of the popular feeling, dissolve the ...ably, and never call another. It met on the 21st March 1681, and the Whigs soon showed that the ...sion Bill was still uppermost in their minds. The ...permitted case of his ministers to propose, that, as ...ands, the Princess of Orange should reign as regent, ...the new king be for ever excluded five hundred ...from his dominions. To this concession, which ...seems much greater than could have reasonably ...expected, they would not listen for a moment. ...ples then dissolved the Parliament as utterly in...able, and, as he expected, he was generally ap...ded for the act. The king henceforth ruled entirely without ...ent, being secretly supplied with money by France, ...consideration of his non-interference with the con...sts of that country.

THE RYE-HOUSE PLOT.—DEATH OF CHARLES II.

...t of slavishness now befell the English nation, as ...rtable in its extent as the late fury against the ...t and the Catholics. Supported by this mood of ...people, Charles caused all the corporations in the ...dom to give up their old charters, and accept of ...ones, by which he became all-powerful over the ...ions of magistrates, and, consequently, over those ...parliamentary representatives, should ever another ...ion of that kind take place. The leaders of the ...majority in Parliament, comprising the Duke of ...mouth, Lord Russell (son of the Earl of Bedford), ...Earl of Essex, Lord Howard, the famous Algernon ...ey, and John Hampden, grandson of the patriot ...first resisted Charles I., long refused to absolute ...ule, formed a project for raising an insurrection in ...don, to be supported by one in the west of England, ...breaker under the Earl of Argyle in Scotland, and ...object of which should be confined to a melioration ...e government. They were betrayed by an asso...named Rumsey, and implicated, by a train of ...cumstantial circumstances, in a plot for assassinating ...King (styled the Rye-house plot), of which they ...perfectly innocent. By the execution of Russell ...Sydney, and some other severities, the triumph of ...king might be considered as completed. After ...ng been an absolute sovereign for nearly four years, ...died (February 6, 1685), professing himself at the ...to be a Catholic, and was succeeded by the Duke ...rk.

...harles II. was a prince of a gay and cheerful dis...ion, and so noted a saver of witty things, and so ...ined to humorous amusements, that he was called ...merry monarch." His wit, shrewdness, and good ...mour, form the best side of his character. On the ...r side, we find a deficiency of almost every active ...and of all steady principle. He never allowed ...dity of his station, or any claim upon his justice ...clemency, to interfere with his own interests, or even ...sturb him in his indolent and vicious pleasures. ...Leaving his wife, who never had any children, he ...t most of his time with his various mistresses, who ...only lived at court, and were even received by the ...en. Of these ladies, the most remarkable were ...ise Querouaile, whom he created Duchess of Ports...uth, and Barbara Villiers, whom he made Duchess ...Cleveland. Six sons of the king by his mistresses ...e made dukes, and five of these were the progeni...s of families in the English nobility.

...During the reign of Charles II., the nation advanced ...siderably in the arts of navigation and commerce; ...d the manufactures of brass, glass, silk, hats, and ...ce, were established. The post-office, set up during ...e Commonwealth as a means of raising money, *was* ...ormed in this reign, *and the penny post was now* ...*set up in London by a private person. Roads were* ...*being improved, and stage-coach travelling was com*-

...menced, though not carried to any great extent. During this reign, tea, coffee, and chocolate, which have had a great effect in improving and softening manners, were first introduced. In 1660, the Royal Society was established in London, for the cultivation of natural science, mathematics, and all useful knowledge. The science of astronomy was greatly advanced by the investigations of Flamstead and Halley. But the greatest contribution to science was made by Sir Isaac Newton, whose Principles of Natural Philosophy were published in 1623; in this work, the true theory of planetary motions was first explained, in reference to the principle of gravitation. Amongst the literary men of the period, the first place is to be assigned to John Milton, author of the Paradise Lost and other poems: Samuel Butler shines as a humorous and satirical poet, and Edmund Waller as a lyrist. Amongst divines, the highest names connected with the church are those of Jeremy Taylor and Isaac Barrow; while the highest among the nonconformists are those of Richard Baxter and John Bunyan. The theatre, which had been suppressed during the Commonwealth, was revived in this reign; but the drama exhibited less talent and more licentiousness than it did in the previous reigns. Female characters, which had formerly been acted by men, were now for the first time performed by females.

JAMES II.—EXPEDITION OF MONMOUTH.

Charles II., with all his faults, had conducted himself towards his subjects with so much personal cordiality, and had so well calculated his ground before making any aggressions upon popular liberty, that he might probably have pursued his arbitrary career for many years longer. But his brother James, though much more respectable as a man, more industrious, and more sincere, wanted entirely the easiness of carriage, pleasantry, and penetration, which were the grounds of the late king's popularity and success. He was, moreover, an avowed Catholic, and inspired by an ardent desire of reforming the nation back into that faith. He began his reign by declaring before the privy council his intention to govern solely by the laws, and to maintain the existing church; and such was the confidence in his sincerity, that he soon became very popular. Addresses poured in upon him from all quarters, professing the most abject devotion to his person. The parliament called by him voted an ample revenue, and expressed the greatest servility towards him in all things. The doctrines of passive obedience, and the divine right of the sovereign, were now openly preached. The University of Oxford promulgated an elaborate declaration of passive obedience to rulers, which they declared to be "clear, absolute, and without any exception of any state or order of men."

The remains of the Whig party still existed, though in exile, and there were some districts of the country where they were supposed to have considerable influence. The Duke of Monmouth and the Earl of Argyle (the latter of whom had been condemned to death in Scotland, for adding a qualification to the test-oath, but had escaped) met in Holland, and projected two separate invasions, for the purpose of expelling King James. The former soon after landed in the west of England with a small retinue, and quickly found himself at the head of 5000 persons, though irregularly armed. At several places he caused himself to be proclaimed king, which offended many of his principal adherents, as inconsistent with his previous engagements. Upon the whole, his conduct was not energetic enough for the management of such an enterprise. Being attacked by the king's troops near Bridgewater, his infantry fought with some spirit, but, being deserted by the cavalry, and by the duke himself, were obliged to give way. Monmouth was taken and executed. Many of his followers were hanged without form of trial by the royal troops, and others were afterwards put to death, with hardly any more formality, by the celebrated Chief-Justice Jefferies, whom the king sent down with a commission to try the offenders. The

butchery of several hundred men of low condition, who were unable of themselves to do any harm to the government, was looked upon as a most unjustifiable piece of cruelty, even if it had been legally done; and the principal blame was popularly ascribed to the king.

The Earl of Argyle sailed in May with a corresponding expedition, and landed in that part of the West Highlands which owned his authority. Unfortunately for him, the government had received warning, and seized all the gentlemen of his clan, upon whom he had chiefly depended. He nevertheless raised between two and three thousand men, and made a timid advance to Glasgow, in the expectation of being joined by the persecuted Presbyterians of that part of the country. Being surrounded on the march by various parties of troops, he dispersed his army, and sought to escape in disguise, but was taken, brought to Edinburgh, and executed. Thus terminated the last effort made by the Whig party to ameliorate the despotic sway of the Stuarts.

ARBITRARY MEASURES OF THE KING.

Encouraged by his successes, James conceived that he might safely begin the process of changing the established religion of the country. On the plea of his supremacy over the church, he took the liberty of dispensing with the test-oath in favour of some Catholic officers, and thus broke an act which was looked upon, under existing circumstances, as the chief safeguard of the Protestant faith. His Parliament, servile as it was in temporal matters, took the alarm at this spiritual danger, and gave the king so effectual a resistance that he resorted to a dissolution. Transactions exactly similar took place in Scotland.

Heedless of these symptoms, he proclaimed an universal toleration, for the purpose of relieving the Catholics, and thus assumed the unconstitutional right of dispensing with acts of Parliament. The nation was thrown by this measure, and by the numerous promotions of Roman Catholics, into a state of great alarm; even the clergy, who had been so eager to preach an implicit obedience to the royal will, began to see that it might be productive of much danger. When James commanded that his proclamation of toleration should be read in every pulpit in the country, only two hundred of the clergy obeyed. Six of the bishops joined in a respectful petition against the order; but the king declared that document to be a seditious libel, and threw the petitioners into the Tower. In June 1688, they were tried in Westminster Hall, and, to the infinite joy of the nation, acquitted.

Blinded by religious zeal, the king proceeded on his fatal course. In defiance of the law, he held open intercourse with the Pope, for the restoration of Britain to the bosom of the Romish church. He called Catholic lords to the privy council, and even placed some in the cabinet. Chapels, by his instigation, were everywhere built, and monks and priests went openly about his palace. A court of high commission—a cruel instrument of power under Charles I.—was erected, and before this every clerical person who gave any offence to the king was summoned. He also excited great indignation, by violently thrusting a Catholic upon Magdalen College, at Oxford, as its head, and expelling the members for their resistance to his will. Public feeling was wound to the highest pitch of excitement by the queen being delivered (June 10, 1688) of a son, who might be expected to perpetuate the Catholic religion in the country, and whom many suspected to be a supposititious child, brought forward solely for that purpose.

The disaffection produced by these circumstances extended to every class of the king's subjects, except the small body of Roman Catholics, many of whom could not help regarding the royal measures as imprudent. The Tories were enraged at the ruin threatened to the Church of England, which they regarded as the grand support of conservative principles in the empire. The Whigs, who had already made many strenuous efforts to exclude or expel the king, were now more in against him than ever. The clergy, a popular a fluential body, were indignant at the injuries in upon their church; and even the dissenters, comprehended in the general toleration, saw too through its motive, and were too well convinced illegality of its manner, and of the danger of its as affecting the Protestant faith, to be exempte the general sentiment. But for the birth of the of Wales, the people at large might have been co to wait for the relief which was to be expected the death of the king, from the succession of the P of Orange, who was a Protestant, and united chief military defender of that interest in Europ this hope was now shut out, and it was neces resolve upon some decisive measures for the s the national religion.

THE REVOLUTION.

In this crisis, some of the principal nobility and with a few clergymen, united in a secret addres Prince of Orange, calling upon him to come ov an armed force, and aid them in protecting the and liberties. This prince, who feared that F would soon be joined to France against the few ing Protestant powers, and also that his pros the succession in that country, as nephew and law of the king,* were endangered, listened re this call, and immediately collected a large fl army, comprising many individuals, natives Scotland and England, who had fled from the government of the Stuart princes. The prep for the expedition were conducted with great and James was partly blinded to them, by a that their only object was to frighten him into connexion with France, in order to make him to his subjects. When he was at length assure minister in Holland that he might immediately a formidable invasion, he grew pale, and drop letter from his hands. He immediately ordere and large army to be collected, and, that he m gain the affections of his subjects, he called a ment, and undid many of his late measures. Th justly suspected his concessions to be insince were confirmed in their belief, when, on a ru the Prince of Orange being put back by a st recalled the writs for assembling Parliament.

On the 19th of October, the Prince of Ora sail with 50 ships of war, 25 frigates, 25 fire-sh 500 transports, containing 15,000 land-troops. occasioned some damage and delay; but he s to sea again, and proceeded with a fair wind al British Channel, exhibiting from his own vesse on which were inscribed the words, "The Pro Religion and the Liberties of England," w apposite motto of his family, "*Je Maintiendrai*" will maintain. As he passed between Dover and his armament was visible to crowds of spect both shores, whose feelings were much excited by its appearance and its well-known purpos English fleet being detained at Harwich by t wind which was so favourable to the prince, he (November 5) without opposition at Torbay, and diately proceeded to circulate a manifesto, decla grievances of the kingdom, and promising, v support of the people, to redress them.

At the first, there seemed some reason to f the prince would not meet with adequate supp his march to Exeter, and for eight days after there, he was not joined by any person of conse The nation, however, soon became alive to th sity of giving him encouragement. The gentry o and Somersetshires formed an association in hi The Earls of Bedford and Abingdon, with other of distinction, repaired to his quarters at Exete

* The mother of the prince was Mary Stuart, eldest of Charles I., and sister of James II. Failing the infa of Wales, his own wife, and the Princess Anne, the two of the king, he was the heir of the British crown.

...ment took arms in Cheshire; the city of York was ... by the Earl of Danby; the Earl of Bath, governor of Plymouth, declared for the prince; and the Earl of Devonshire made a like declaration in Derby. He proceeded ...ard a vessel in the Medway, and, after some ob...ions, arrived safely in France, where Louis readily ...ted him an asylum.

...same day that the king left Whitehall for the ..., his nephew and son-in-law arrived at St ...'s. The public bodies immediately waited on him, ...press their zeal for his cause; and such of the ...bers of the late Parliaments as happened to be in ..., having met by his invitation, requested him to ...write for a convention, in order to settle the na...

He was in the same manner, and for the same ..., requested to call a convention in Scotland. ...English convention met on the 22d of January ..., and during its debates the prince maintained a ...unanimous silence and neutrality. The Tory party, ...h it had joined in calling him over, displayed ...scruples respecting the alteration of the succes... and seemed at first inclined to settle the crown on ...ncess, while William should have only the office ...ent; but when this was mentioned to the prince, ...ously replied, that in that event, he should immedi...ly return to Holland. A bill was then passed, ...ring that "James II., having endeavoured to sub... the constitution, by breaking the *original contract* ...een the king and people, and having withdrawn ...self from the kingdom, has *abdicated* the govern...t; and that the throne is thereby become *vacant*." ...he bill was added what was called a *Declaration of ...*, namely, an enumeration of the various laws by ...h the royal prerogative and the popular liberties ...formerly been settled, but which had been violated ...evaded by the Stuart sovereigns. WILLIAM and ..., having expressed their willingness to ratify this ...aration, were proclaimed king and queen jointly—...administration to rest in William; and the con...tion was then converted into a Parliament.

...Scotland, where the Presbyterians had resumed ...ascendancy, the convention came to a less timid ...ion. It declared that James, by the abuse of his ..., had *forfeited* all right to the crown—a decision ...affecting his posterity; and William and Mary ...e immediately after proclaimed. By a bill passed in the English Parliament, the succession was settled upon the survivor of the existing royal pair; next upon the Princess Anne and her children; and, finally, upon the children of William by any other consort—an arrangement in which no hereditary principle was overlooked, except that which would have given a preference to James and his infant son.

By the Revolution, as this great event was styled, it might be considered as finally decided that the monarchy was not a divine institution, superior to human challenge, as the late kings had represented it, but one dependent on the people, and established and maintained for their benefit. Many advantages, of smaller importance, though of more direct and practical utility, resulted from the change. The Episcopal Church, which in Scotland had occasioned incessant discontent and disturbance for the last twenty-eight years, was abolished in that kingdom, and the favourite Presbyterian forms were established, to the almost universal satisfaction of the nation. By an act passed in the English Parliament, the dissenters from the Church in England were freed from the severities to which they had been exposed during the last two reigns. The royal revenue, which had formerly been fixed at the beginning of each reign, was now settled annually by the House of Commons, so that the king was more under the control of his people than formerly. The independence and impartiality of the judges were now ensured by their being appointed for life, or during good behaviour, instead of being removable at the royal pleasure as heretofore. William is said to have wished to grant some farther concessions in favour of the Dissenters, but was prevented by the powerful opposition which the Tory party presented in Parliament.

RESISTANCE IN SCOTLAND AND IRELAND.

The new government was at first extremely popular in Scotland; but one portion of the people was much opposed to it. This consisted of the Highland clans—a primitive race, unable to appreciate the rights which had been gained, prepossessed in favour of direct hereditary succession, and of such warlike habits, that though a minority, they were able to give no small trouble to the peaceful Lowlanders. When the Scottish convention was about to settle the crown on William and Mary, Viscount Dundee, formerly Graham of Claverhouse, and celebrated for his severity upon the recusant Presbyterians, raised an insurrection in the Highlands in favour of King James, while the Duke of Gordon, a Catholic, still held out Edinburgh Castle in the same interest. It was with no small difficulty that the new government could obtain the means of reducing these opponents. The castle, after a protracted siege, was given up in June (1689). General Mackay was dispatched by William, with a few troops, to join with such forces as he could obtain in Scotland, and endeavour to suppress the insurrection in the Highlands. He encountered Dundee at Killiecrankie (July 27), and, though his troops were greatly superior in number and discipline, experienced a complete defeat. Dundee, however, fell by a musket-shot in the moment of victory, and his army was unable to follow up its advantage. In a short time the Highland clans were induced to yield a nominal obedience to William and Mary.

In Ireland, a much more formidable resistance was offered to the revolution settlement. Since the accession of James, the Romish faith might be described as virtually predominant in that kingdom. The laws against Catholics had been suspended by the royal authority, all public offices were filled by them, and, though the established clergy were not deprived of their benefices, very little tithe was paid to them. The vice-regal office was held by the Earl of Tyrconnel, a violent and ambitious young man, disposed to second the king in all his imprudent measures, and resolved, in the event of their failing, to throw the country into the hands of the French. The people at large, being chiefly Catholics, were warmly attached to the late sovereign, whose cause they regarded as their own.

Early in the spring of 1689, James proceeded from France to Ireland, where he was soon at the head of a large though ill-disciplined army. He immediately ratified an act of the Irish Parliament for annulling that settlement of the Protestants upon the lands of Catholics, which had taken place in the time of Cromwell, and another for attainting two thousand persons of the Protestant faith. The Protestants, finding themselves thus dispossessed of what they considered their property, and exposed to the vengeance of a majority over whom they had long ruled, fled to Londonderry, Inniskillen, and other fortified towns, where they made a desperate resistance, in the hope of being speedily succoured by King William. That sovereign now led over a large army to Ireland, and (July 1) attacked the native forces under his father-in-law at the fords of the Boyne, near the village of Dunore, where he gained a complete victory.

James was needlessly dispirited by this disaster, and lost no time in sailing again to France. In reality, the Irish made a better appearance, and fought more vigorously, after the battle of the Boyne, than before it. The Duke of Berwick, a natural son of James, and the Earl of Tyrconnel, still kept the field with a large body of cavalry, and the infantry were in the mean time effectually protected in the town of Limerick. William invested this town, and, in one assault upon it, lost two thousand men, which so disheartened him, that he went back to England, leaving his officers to prosecute the war. The Irish army afterwards fought a regular battle at Aghrim, when, partly owing to the loss of their brave leader, St Ruth, they were totally routed. The remains of the Catholic forces took refuge in Limerick, where they finally submitted in terms of a treaty which seemed to secure the Catholic population in all desirable rights and privileges. It was agreed that they should receive a general pardon; that their estates should be restored, their attainders annulled, and their outlawries reversed; that Roman Catholics should enjoy the same toleration as in the days of Charles II., and not be disturbed in the exercise of their religion; that they should be restored to all the privileges of subjects, on simply swearing allegiance to the king and queen; and that such as chose to follow the fortunes of James (of whom there was a vast number), should be conveyed to the Continent at the expense of government.

King William, whose disposition was tolerant, promised to procure a ratification of this treaty by Parliament, but he was thwarted in his design. An act was passed in England, making it necessary for all members of the Irish Parliament, and all persons filling civil, military, and ecclesiastical offices in Ireland, to take an oath abjuring the most important doctrines of the Catholic faith. After this had taken effect, in the filling of the Irish Parliament with Protestants, an act was passed by that assembly, professing to be a confirmation of the treaty of Limerick, but in reality putting the Catholics into a worse condition than before.

REIGN OF WILLIAM III.

Though all military opposition was thus overcome, William soon found difficulties of another kind in the management of the state. The Tories, though glad to save the established church by calling in his interference, had submitted with no good grace to the necessity of making him king; and no sooner was the danger past, than their usual principles of hereditary right were in a great measure revived. From the name of the exiled monarch, they now began to be known by the appellation of *Jacobites*. James's hopes of a restoration were thus for a long time kept alive, and the peace of William's mind was so much embittered, as to make his sovereignty appear a dear purchase. Perhaps the only circumstance which reconciled the king to his situation, was the great additional force he could now bring against the ambitious designs of Louis XIV. Almost from his accession he entered heartily into the combination of European powers for checking this warlike prince, and conducted military operations against him every summer in person. The necessi supplies for that purpose rendered him u he had been willing, to resist any liberal me posed to him in Parliament, and hence hi the famous Triennial Act in 1694, by whic pointed that a new Parliament should be third year. In this year died Queen Ma offspring; after which William reigned s narch.

While William was treated in Englan than justice, he lost all his popularity in consequence of two separate acts, chara great cruelty and injustice. An order had commanding all the Highland chiefs, under and sword, to give in their submission bef day of the year 1691. One individual—M Glencoe—was prevented by accident fron the day, and letters of fire and sword, si king, were accordingly issued against him. tary party intrusted with this duty, instea advancing to the task, came among the cla partook of their hospitality and amusement indicated their intentions till the morning of February (1692), when they attacked th ing people in their beds, and mercilessly came in their way. Thirty-eight persons, i chief and his wife, were slaughtered, and died in the snow, as they vainly tried to more atrocious action does not stain mod though the barbarous circumstances of th were more owing to feelings of private rev part of some of the officials of government than to the intentions of William.

Two or three years after, the Scottish p to turn their attention to commerce, by whi great advantages gained by neighbouring they planned a colony on the Isthmus of D: they thought might become an emporium fo and Indian produce. They subscribed ar selves, for this purpose, no less than £100,0 was added more than as much again by n London and Holland. QUEEN ANNE.—MARLBOROUGH'S CAMPAIGNS.

William was succeeded by his sister-in-law ANNE, ...nd daughter of the late James II.; a *princess now ...y-eight years of age, and chiefly remarkable for ... zealous attachment to the Church of England.* The movement against the King of France had not been confined to Great Britain; it was a combination of that power with the Emperor of Germany and the States of Holland. Queen Anne found it necessary to maintain her place in the Grand Alliance, as it was formed; and the Duke of Marlborough was sent over to the Continent with a large army to prosecute the war in conjunction with the allies. Now commenced that career of military glory which has rendered the reign of Anne and the name of Marlborough so famous. In Germany and Flanders, under this commander, the British army gained some signal successes, particularly those of Blenheim and Ramillies: in Spain, a smaller army, under the chivalrously brave Earl of Peterborough, performed other services of an important kind. The war, however, was one in which Britain had no real interest—for it has been seen that Spain has continued under a branch of the House of Bourbon, without greatly endangering other states.

A party, consisting chiefly of Tories, endeavoured, in 1706, to put an end to the war; and France was so much reduced in strength, as to concede all the objects for which the contest had been commenced. But the people were so strongly inspired with a desire of humiliating France, which in commerce and religion they considered their natural enemy, that some ambitious statesmen of a contrary line of politics were enabled to mar the design of a treaty. Among these was the Duke of Marlborough, who, being permitted to profit, not only by his pay but by perquisites attached to his command, wished the war to be protracted, merely that he might make his enormous wealth a little greater. It was in consequence of these unnecessary interferences with continental politics, urged chiefly by the people, and by a popular class of statesmen, that the first large sums of the national debt were contracted.

UNION OF ENGLAND AND SCOTLAND.

Since their religious enthusiasm had been laid at rest by the Revolution Settlement, the Scottish people had been chiefly animated by a desire of participating in the commerce of England. The treatment of their expedition to Darien had now inspired them with a bitter feeling against their southern neighbours, and they resolved to show their power of counter-annoyance, by holding up threats of dissenting from England in the matter of the succession. In 1703, their Parliament passed the famous *Act of Security*, by which it was ordained that the successor of her Majesty in Scotland should not be the same with the individual adopted by the English Parliament, unless there should be a free communication of trade between the countries, and the affairs of Scotland thoroughly secured from English influence. Another act was at the same time passed, for putting the nation under arms. The English ministers then saw that an incorporating union would be necessary to prevent the Pretender from gaining the Scottish crown, and to protect England from the attacks of a hostile nation. For this purpose, they exerted themselves so effectually in the Scottish Parliament, as to obtain an act, enabling the queen to nominate commissioners for the arrangement of an union. The men appointed, thirty on each side, were, with hardly an exception, the friends of the Court and of the Revolution Settlement; and the treaty accordingly was framed without difficulty.

In October 1706, this document was submitted to the Scottish Parliament, and was found to contain the following principal points:—that the two nations were to be indissolubly united under one government and legislature, each, however, retaining its own civil and criminal law; the crown to be in the House of Hanover; the Scottish Presbyterian church to be guaranteed; forty-five members to be sent by the Scottish counties and burghs to the House of Commons, and sixteen elective peers to be sent to the Upper House by the nobles; the taxes to be equalised, but, in consideration of the elevation of the Scotch imposts to the level of the

English (for the latter people already owed sixteen millions), an equivalent was to be given to Scotland, amounting to nearly four hundred thousand pounds, which was to aid in renewing the coin, and other objects. These terms were regarded in Scotland as miserably inadequate; and the very idea of the loss of an independent legislature and a place among governments, raised their utmost indignation. Nevertheless, by dint of bribery, the union was carried through Parliament; and, from the 1st of May 1707, the two countries formed one state, under the title of the Kingdom of Great Britain.

HIGH CHURCH ENTHUSIASM.

Since the Revolution, the Whigs might be considered as the predominant party in England. They almost exclusively constituted the ministries, and a large majority in the Parliaments, of King William. The sentiments of the queen were of a different cast from theirs. She disrespected the Revolution Settlement, by which she reigned; and was more zealously attached than they to the Church of England, in all its doctrines, practices, and privileges. As the remembrance of the errors of King James faded from the public recollection, or were put out of view by more recent grievances, the people began to partake more generally of the Tory spirit. The Parliament which they returned at the beginning of the new reign, contained a much larger admixture of that party than the former one. The Tory feeling of both people and Parliament chiefly took the direction of a strong attachment to the Church of England, which they wished to maintain in uncompromising supremacy, and in all its privileges; while the Whig party, in general, were favourable to the toleration called for by the dissenters. The distinction of High Church and Low Church now became conspicuous, the one phrase implying the ecclesiastical views of the Tories, while the other referred to those of the Whigs. In this Parliament, the House of Commons passed a bill against *occasional conformity*, by which penalties were imposed on all persons in office who should attend dissenting places of worship; but it was thrown out by the Upper House, in which the bishops created by William voted against it.

An impeachment of the ministry raised the High Church enthusiasm to an extraordinary height. A divine of inferior note, named Henry Sacheverell, had preached a violent sermon, in which he seemed to call upon the people to take up arms in defence of their endangered church. The ministers were so weak as to give this man a solemn trial, during which the people rose so tumultuously in his favour, that, though declared guilty, it was found impossible to inflict upon him more than a nominal punishment. After the trial, he received more marks of public reverence and honour than were ever bestowed on the greatest national benefactor. In proportion to the popularity of Dr Sacheverell, was the loss of public favour experienced by the Whig party. About the same time, through some court intrigues, they forfeited all remaining favour with their royal mistress. Mrs Masham, a lady of the court, and favourite of the queen, had contrived to introduce into the cabinet two Tory statesmen, Mr Robert Harley, afterwards Earl of Oxford, and Mr Henry St John, afterwards Lord Bolingbroke. These gentlemen having attempted to set up a party for themselves, their superior, Lord Godolphin, dismissed them, to the great displeasure of Queen Anne, who now resolved to get quit of the Whig party at the first opportunity. In August 1710, Harley and St John came into power, at the head of a decidedly Tory ministry, which, though of brief duration, was destined to make an important figure in the national history. The queen at the same time called a new Parliament, which proved to be almost wholly composed of the Tory party.

PEACE OF UTRECHT.—DEATH OF QUEEN ANNE.

The ascendancy of the new cabinet immediately applied *measures*, though very secretly, to the business of bringing about a peace. When their plans w tured, the consent of the House of Commons w gained; but the Lords having shown some rel it was found necessary to create twelve new p order to overpower the sense of that part of tl lature. After a tedious course of negotiation, and Holland concluded a peace at Utrecht (171 ing the Emperor of Germany still at war. arrangement, Philip V. was permitted to retai and the Indies, but no other part of the dominio his ambitious grandfather had endeavoured t for him; and it was provided that he and his ants should never inherit the kingdom of Fra any future King of France accede to the crown Britain obtained nothing tangible by all her ex except the possession of Gibraltar and Minor the privilege of being exclusively employed t slaves to the Spanish American colonies. It ha been considered a stain upon the nation, that i have concluded a separate peace under such cla circumstances, as the interests of the other bel parties were thereby greatly injured. For th fication of their High Church supporters, the m obtained an act for preventing dissenters from schools, and another for establishing church pa in Scotland, the former of which was repeale following reign.

It is believed that Queen Anne and her Tor ters were in secret willing to promote the res of the main line of the Stuart family, and Ha St John are now known to have intrigued for th pose. But before any plan could be formed, th took suddenly ill and died (August 1, 1714), w ministers had no alternative but to proceed ac to the Act of Settlement. The Electress Sophi recently dead, her son, the elector, was pro under the title of George I.

The reign of Queen Anne is not more distin by the wonderful series of victories gained by borough, than by the brilliant list of literary m now flourished, and who have caused this to b the Augustan age of English literature, as reso that of the Roman Emperor Augustus. Alexand stands unrivalled in polished verse on moral s Jonathan Swift is a miscellaneous writer of s vigour and an extraordinary kind of humour. Addison wrote on familiar life and on moral a tical subjects with a degree of elegance before un Sir Richard Steele was a lively writer of miscel essays. The last author, with assistance from and others, set on foot the Tatler, Spectat Guardian, the earliest examples of small pe papers in England, and which continue to thes be regarded as standard works. Gibber, Co Vanburgh, and Farquhar, were distinguished of comedy; and Prior, Philips, and Rowe, were p poets. In graver literature, this age is not le nent. Dr Berkeley shines as a metaphysicia Sherlock, Atterbury, and Clark as divines; and B as a critic of the Roman classics.

ACCESSION OF THE HOUSE OF HANOVER.—GEORGE I. 1715 to

The new sovereign lost no time in coming Britain, and fixing himself in that heritage wh family has ever since retained. He was fifty-fou of age, of a good though not brilliant understa and very firm in his principles. Knowing well t Whigs were his only true friends, he at once them into the administration. It was the cus great period for every party, on getting into po try to annihilate their opponents. Not only wa whole Tory party insulted by the king, but a com of the House of Commons was appointed to p articles of impeachment against Oxford, Bolin the Duke of Ormond, and the Earl of Str Bolingbroke, perceiving his life to be in danger, the Continent; and his attainder was in conse moved and carried by his rival Walpole. Ormo

a similar fate. Oxford, after a protracted trial, ly saved in consequence of a difference between rds and Commons.

ing the first year of King George, the Tories kept y unwavering popular disturbances in favour of Church principles; but the Whigs, gaining a ty in the new House of Commons, were able to ass a little by the celebrated enactment called ial Act, which permits military force to be used in ing a crowd, after a certain space of time has allowed. Disappointed in their hopes of office and , and stung by the treatment of their leaders, the resolved to attempt bringing in the Pretender rs of arms. With an eager hopefulness, which ing time was characteristic of the party, they be- that all England and Scotland were ready to up arms for the Pretender, when in reality there at a limited portion of the people so inclined, and section unwilling to move, if they saw the least lined to these circumstances, and without design ment, they commenced the unfortunate civil war 5.

Earl of Mar, who had been a secretary of state late administration, raised his standard in Brae- September 6), without any commission from the reign, and was soon joined by Highland clans to mount of 10,000 men, who rendered him master Scotland north of the Forth. There, however, ently permitted himself to be cooped up by the of Argyle, who, with a far less numerous force, ssed himself at Stirling. Mar expected to be ted by an invasion of England by the Duke of ord, and a rising of the people of that country. he duke completely failed in his design, and no ssible place, except in Northumberland. There ester, one of the members of Parliament for the y, and the Earl of Derwentwater, with some other ons, appeared in arms, but unsupported by any derable portion of the people. Mar detached a ut 1000 foot, under Mackintosh of Borlum, to the Northumbrian insurgents, who complained they had no infantry. The junction was managed great address; and at the same time some noble- and gentlemen of the south of Scotland attached selves to the southern army. The government ll provided with troops; but it nevertheless sent a force against Mr Foster, as obliged him to re- with his men into the town of Preston, in Lanca- , where, after an obstinate defence, the whole (November 13) surrendered themselves prisoners e king's mercy. On the same day, the Earl of met the Duke of Argyle at Sheriffmuir, near Dun- , where a battle was fought, in which, after the ur of the battles in the civil war, the right wing ch army was successful, but neither altogether rious. The duke withdrew in the face of his y to Stirling, and the Earl retired to Perth, re- d to wait for the news of an invasion from France, r the arrival of the Pretender, whom he had in- to Scotland.

e did not for some time become aware how little n he had to expect support from France. Louis , upon whom the hopes of the party greatly rested, ed in September, leaving the government to the nt Orleans, who had strong personal reasons for ng to cultivate the good will of the British mo- h, and of course declined to assist in the present rpose. The Pretender, nevertheless, sailed for land, and, on the 22d of December, arrived incog- at Peterhead, bringing nothing but his own person d his adherents. Mar, who had already attempted gotiate a submission to the government, brought forward to Perth, where he was amused for some with preparations for his coronation. But before ad been many days there, the Duke of Argyle d himself in a condition to advance against the in- nt forces; and, on the 30th of January 1716, this rtunate prince commenced a retreat to the north, with his dispirited army. On the 4th of February, he and the Earl of Mar provided for their own safety by going on board a vessel at Montrose, and setting sail for France: the army dispersed itself into the Highlands. For this unhappy appearance in arms, the Earl of Derwentwater, Viscount Kenmure, and about twenty inferior persons, were executed; forty Scottish families of the first rank lost their estates, and many excellent members of society became exiles for the remainder of their lives.

CHARACTER OF THE GOVERNMENT UNDER GEORGE I.

The suppression of this insurrection, and the ruin of so many Tory leaders, tended to increase the power of the Whig party, and the stability of the Hanoverian dynasty. The government, nevertheless, acted under considerable difficulties, as they were opposed by the majority of the clergy and country gentry, as well as by the whole of the mob feeling, except in the large commercial towns. To avoid the hazard of too often appealing to the people, they carried, in 1716, a bill for repealing King William's Triennial Act, and protracting the present and all future Parliaments to a duration of seven years. The chief popular support of the government was in the Dissenters, and the middle classes of the community.

From the peace of Utrecht, Britain remained free from foreign war for nearly thirty years, excepting that, in 1718, the ministry was called on to interfere for the repression of an attempt on the part of Spain to regain her Italian territories. A Scotsman, named Law, who had become comptroller-general of France, and aroused that country with financial schemes, which at first promised to enrich, but finally almost ruined the country, was the means, in 1720, of inspiriting the British people with a similar visionary project, called the South Sea Scheme. This might be described as a joint-stock company, professedly trading in the South Seas, but chiefly engaged in a scheme for managing the national debt. It seemed for a time to prosper, and many realised large fortunes by selling their shares at a premium to others; but in a short time its unsoundness was discovered, the price of shares fell, and thousands were utterly ruined. With great difficulty, and by an extremely complicated adjustment, the House of Commons equalised as nearly as possible the state of gain and loss among the innocent parties, and credit was restored. Sir Robert Walpole, who was chiefly concerned in effecting this arrangement, became Premier and Chancellor of the Exchequer, and for upwards of twenty years from that period (April 1721), he must be looked on as the prime manager of the public affairs.

At the beginning of the reign of George I. the national debt amounted to fifty-three millions, and, owing to there having been no war, it was rather less at the time of the king's death. The annual expenditure of the state was about seven millions, or scarcely a seventh part of what it now is. The commerce and manufactures of England continued to advance steadily during this reign; but Scotland and Ireland remained in an unimproved state. Roads were now for the first time made in the Highlands. The chief literary men were the same as those who had come into repute in the time of Queen Anne: in addition to them, John Gay is to be reckoned amongst the poets, and Waterland and Lardner amongst the divines. This was also more particularly the age of Daniel Defoe, a dexterous writer of pamphlets on the nonconformist side, but far more noted in later times on account of his admirable tale of Robinson Crusoe.

GEORGE II.—WAR WITH SPAIN AND FRANCE.

George I., at his death in 1727, was succeeded by his son, GEORGE II., a prince of moderate abilities, but conscientious, and free from all gross faults. In the early part of his reign, Walpole effected some useful measures, and upon the whole was a vigorous and enlightened administrator of public affairs, though nothing can justify the extensive system of bribery by which

alone he pretended to manage the House of Commons. After a peace of extraordinary duration, he was urged, much against his will, into a contest with Spain, on account of some efforts made by that country to check an illicit trade carried on by British merchants in its American colonies. In searching vessels for the prevention of this traffic, the Spaniards had made some trifling aggressions; and British spirit took fire at the indignity of being liable to a search by any neighbouring state, even for the prevention of a notorious breach of treaty. The community therefore demanded a war, and the minister, with great reluctance, was obliged to comply. One fleet, under Admiral Haddock, was sent to cruise off the coast of Spain, and another, under Admiral Vernon, was sent against the American colonies. The latter gained lustre by taking the important town of Portobello. Another and larger expedition, with 10,000 soldiers, was then sent to reinforce Vernon; but, owing to disputes between him and the commander of the troops, no further triumphs were gained. A timid, ill-concerted, and ill-conducted attack upon the fortifications of Carthagena, lost Britain about 20,000 men. Meantime, a third fleet, under Anson, sailed to the eastern coast of Spanish America, in order to co-operate with Vernon; but only one of the vessels reached its destination. Anson, thus reduced in naval force, took several prizes off Chili, and plundered the town of Paita, but could venture upon no more hazardous enterprise. He cruised across the Pacific, in the hope of meeting one of the Spanish galleons, which usually contained great quantities of bullion; but did not succeed, till, on his return from refitting at Canton, he took the Manilla transport, with treasure to the amount of three hundred thousand pounds. Though he had failed in all the proper objects of his expedition, the money he brought to the public treasury caused him to be very well received by the people; while the flagrant mismanagement at Carthagena was the subject of general execration.

The Spanish war now languished for some time, while the attention of Britain was attracted to the proceedings of France. After the death of the Emperor Charles VI. of Germany, his dominions fell by inheritance to his daughter, the celebrated Maria Theresa, Queen of Hungary. She was opposed in this succession by the sovereigns of France, Saxony, and Bavaria, all of whom pretended to have some claims on her dominions. A war was commenced against her; the Elector of Bavaria was crowned emperor, under the title of Charles VII.; and such was the success of the French arms, that she was soon reduced to the greatest distress. With this quarrel Britain had little reason for interfering; but the king thought his dominions in Germany endangered, and the people were animated by their usual hostility to the French. Walpole, being conscientiously opposed to the war, allowed himself to be driven from office (February 1742), though he still continued to enjoy the respect of the king.

The ministry was recruited by the most popular men of the late minority, among whom the most conspicuous were Lord Carteret and the Earl of Bath. To the surprise of the nation, this set of statesmen opposed, now they were in power, all the improvements they had lately professed to clamour for, and seemed even more willing than their predecessors to carry out the policy which was suggested by the king's anxiety on account of his foreign dominions. About the time when Great Britain entered into this struggle, the affairs of the Hungarian queen took a surprising turn, and her armies, under her husband the Grand Duke of Tuscany, Prince Charles of Lorraine, and other eminent commanders, began to drive her enemies from her dominions. France, having lost 100,000 men in the contest, sued for peace; but this the queen haughtily refused, in the hope of gaining still greater triumphs by means of Britain. The aid of that power, as it turned out, was of little service to the queen. The Earl of Stair had permitted his army to get into a position of great difficulty at Aschaffenburg, on the Upper Maine, and, but for a blunder of the French, it would probably h starved into a surrender, along with the king a minister (Carteret), both of whom had recent it. The blunder consisted in an attack mad Duke of Grammont, with 30,000 troops, upon tish and Hanoverian infantry, upon a plain village of Dettingen (June 16, 1743). The cheered by the presence of the king, who rode the lines with his sword drawn, received the the French cavalry with great firmness, and c them to retreat—a movement which commu panic to the whole French army, and might h attended with the most disastrous consequence British monarch would have permitted his a to be followed up. This was the last occasion of Great Britain appearing on the field of batt

The death of the Emperor Charles VII., f this great European contest appeared to have rise, might have now given an opportunity for sation of hostilities; but the French thought still necessary, in order to prevent the husband Theresa from being elected emperor, and th were still animated by their usual antipath French. A campaign was therefore opened in the troops of the French nation being comm Count Saxe, distinguished for military genius perience; while the British and Hanoverian a under the charge of the young Duke of Cun second son to the king. To animate the Frenc their sovereign (Louis XV.) and the dauphin the camp. The French having invested To was resolved by the English to hazard a battle, to save that strong city.

The rencounter took place (May 1745) at F near the bridge of Colonne. The British inf vanced under Cumberland, and, notwithsta tremendous fire, which swept them off in who attacked the centre of the position of the Fren which they beat back in so furious a style, t advised the king to retire for the safety of hi Louis bravely refused to stir, being apprehen a retrograde motion on his part would decide against his army. Ashamed to desert their s the French returned to the charge; the cavalry their efforts; and other circumstances conspire a turn to the battle. The British cavalry were p by a mistake from giving their support to the i and the Dutch and Austrian part of the army v totally ineffective. Assailed on all sides, fatig their great exertions, and galled by the French the infantry was obliged to retire, with a loss men, after having beaten every regiment in th army. The Duke of Cumberland, though able draw in good order, did not venture after this to face the enemy during the whole campaign. theless, the Queen of Hungary at this time g summit of her wishes, by the election of her to the imperial throne.

REBELLION OF 1745.

The Pretender had married, in 1719, the Clementina Sobieski of Poland, and was now t of two sons in the bloom of youth, the elder has been distinguished in history by the title Charles Stuart. The misfortunes of the Brit on the Continent, and the dissensions which among the people and the Parliament, encoura prince to make an attempt to recover the thro ancestors. In 1744, he had been furnished b with a large fleet and ample stores to invade th dominions, but had been driven back by a sto prevented from again setting sail by a super under Sir John Norris. The object of Franc enterprise was to produce a diversion in favou own army in the Netherlands. At present, i quence of the victory of Fontenoy, such an e was no longer necessary; but though the Fre narch would not grant him any further supply, resolved to make the proposed attempt, trusti

The ...ament, it must be remarked, had hitherto acted ...e Scotland in a harsh and partial spirit. Sus...

pected and hated by the ruling faction, the High...landers had every temptation to continue in adherence to the exiled family. But when the government be...gan to treat them in a milder spirit, and admitted them to the army and other branches of the public service, their naturally generous and loyal feelings were turned as zealously in favour of the new dynasty as they ever had been in favour of the old. The middle of the eigh...teenth century may be described as the time when Scot...land, after a long period of sloth and poverty, first be...gan to make advances towards that equality with Eng...land, in respect of comfort and prosperity, which it has since attained.

PEACE OF AIX-LA-CHAPELLE.

During the remainder of the war in which Britain and other powers were now engaged with France, the latter was generally successful by land, and unfortunate at sea, the contrary being the case with Britain. In 1748, the two countries found, after nine years of contention, that their losses were equal, though in different departments of their strength. Thirty millions had been added to the national debt of Britain, and France had expended an equal sum. They therefore agreed, by a treaty formed at Aix-la-Chapelle, mutually to restore their respective conquests, and to go back in exactly the same condition in which they stood before the war. A more signal illustration could have scarcely been held forth of the important truth—that war is to the parties in general only a means of waste and loss, and can do no good to any man except at the expense of his neighbour.

COLONIES AND DEPENDENCIES OF BRITAIN—THE SEVEN YEARS' WAR.

For several years after this period the national resources underwent rapid improvement. The most respectable minister who immediately followed Walpole, was the Honourable Henry Pelham, First Lord of the Treasury and Chancellor of the Exchequer, whose commercial and financial schemes were usually very successful. Since the reign of Elizabeth, the British had been active in planting and rearing colonies; of which a considerable number now existed in the West Indies and in North America. The East India Company had also obtained large possessions in Hindostan, which proved the source of great wealth to Britain. The exclusive spirit in which Britain managed the commerce of those territories, provoked the cupidity of the French, who commenced a system of aggression both in India and North America. They, in particular, drew a line of forts along the back settlements of the whole range of the American colonies, from the Gulf of St Lawrence to the Mississippi, so as to prevent the settlers from advancing beyond the Appalachian mountains.

For two or three years the British government suffered these aggressions, and even insults of a more decided nature, to pass unresented; but at length it was determined, in 1756, to proclaim war. A campaign of a novel and difficult character was opened in North America, for the purpose of driving the French from their forts. The first movements were attended with defeat and disaster. The French had gained the exclusive affection of the native Indians, who proved a dangerous and barbarous enemy to the British. Several of the forts were attacked, but without success; in the assault upon Ticonderago, 2000 men were killed. At length, on the accession of Mr William Pitt (afterwards Earl of Chatham) to the office of Secretary of State, a more auspicious era commenced. The British troops and provincials became more experienced in the nature of the service. One after another, the principal forts fell into their hands; and a diversion was created by an attack upon Canada. In September 1759, General Wolfe reduced the town and fort of Quebec, though at the expense of his own life; and the whole colony soon after submitted to the British arms. Meanwhile, Colonel Clive had been equally successful in the East

Indies. He had destroyed the French settlement at Pondicherry, thereby securing to his country the whole coast of Coromandel; and by his famous victory at Plassey (June 26, 1756), over a combination of French and native forces, he laid the foundation of the great territorial power which the British have since gained in Hindostan. Thus the French, instead of gaining the colonies of other nations, ended by losing some of their own.

While Britain was thus successful in two remote quarters of the world, she experienced a different fortune in Europe. Austria, Russia, and Poland, had combined with France against the new and rising power of Prussia, which was at present directed by Frederick II., commonly called Frederick the Great. Britain on this occasion became the ally of the Prussian monarch, not from any regard to her own interests, but in order that the king might be able to protect his Hanoverian dominions. Immense sums of money were raised for the purpose of paying the troops of those countries which the king was anxious to defend; and the Duke of Cumberland was appointed their commander. This prince was so unfortunate (September 1757) as to bring an army of 40,000 men into an angular piece of country, from which there was no escaping, so that the whole were obliged to lay down their arms to the French, who then became masters of Hanover. Notwithstanding this failure on the part of his ally, Frederick was able, by his extraordinary military genius, and by British subsidies, to defend his dominions for several years against all the forces that Austria, France, and Russia, could bring against him. In the midst of this war (October 25, 1760), George II. died suddenly, in the seventy-seventh year of his age, and was succeeded by his grandson GEORGE III., then only in his twenty-third year.

MISCELLANEOUS CIRCUMSTANCES CONNECTED WITH THE REIGN OF GEORGE II.

The chief domestic event of the reign of George II. was the rise of the religious sect called Methodists. The church had for a considerable time been in a languid state; amongst the community there was little religious feeling of a fervid character; and at no previous time were there so many conspicuous writers against the main doctrines of Christianity. John Wesley, a clergyman of the established church, and several other individuals of an enthusiastic turn of mind, were prompted by these circumstances to attempt to rouse a more zealous piety amongst the people; and in this object they were surprisingly successful. Another clergyman named Whitefield, gifted with oratorical powers which gave him great command over the feelings of an audience, proved of much service as an itinerant preacher in working this reformation. The consequence of these exertions was the organisation of a new religious body, generally called Methodists, comprehending a vast number of congregations in all parts of the kingdom, as well as in the American colonies.

Newspapers first acquired political importance in this reign. They originated in the time of the Commonwealth, but none of a regular periodical nature appeared till after the Restoration, when a busy writer named Roger L'Estrange established in London a weekly one called *The Intelligencer*. Till the Revolution, such small and unimportant newspapers as existed, were trammelled by a licensing power and censorship. When these restrictions were removed, newspapers increased in number, till, in 1709, they were again restricted by the imposition of a penny stamp. In these days newspapers were chiefly conducted by a set of needy and poor writers, to whom the term "Grub Street authors" was generally applied, from many of them living in that wretched part of London. The influence which newspapers were calculated to have over the public mind, was first recognised by Sir Robert Walpole, who, while he never thought of giving the least encouragement to literature on its own account, liberally pensioned various editors who supported his government. About the beginning of this reign, were, in London, one daily paper, fifteen three times week, and one twice a-week, besides a few country papers. A monthly pamphlet, begun in 1731 by Edward Cave, a London bookseller, under the name of the *Gentleman's Magazine*, was composed of the best articles from the newspapers; and thus originated the periodical works termed magazines, which are now conspicuous as vehicles of light literature and political discussion.

The peculiar literary genius of the age was shown in the fictitious prose writings of Fielding, Smollett, Sterne, and in the pictures of Hogarth, all of which represent the national character in its greatest breadth. The novels of Richardson are equally accurate descriptions of manners, but contain no trace of the humour. Next in distinction to these writings, may be placed the essays of John Hawkesworth and Samuel Johnson, the latter of whom did a great service to literature in compiling a dictionary of the English language. James Thomson, William Collins, and Thomas Gray rank high as poets. Carte and Echard were respectable historical writers; and philosophy was cultivated by Francis Hutcheson and David Hartley. Drs Conyers Middleton, Joseph Butler, and Isaac Watts, were the principal writers on religious subjects.

GEORGE III.—BUTE ADMINISTRATION.—PEACE OF 17

Soon after his accession, George III. espoused Princess Charlotte of Mecklenburg-Strelitz, by whom he had a large family. One of his earliest political measures was to confer one of the state-secretaryships upon the Earl of Bute, a Scottish nobleman of Tory Jacobite predilections, who had been his preceptor, and possessed a great influence over his mind. This, with other alterations, infused a peaceful disposition into majesty's counsels, which was not much relished by Pitt. That minister, having secretly discovered that Spain was about to join France against Britain, being thwarted in the line of policy which he consequently thought it necessary to assume, retired with a pension, and a peerage to his wife; after which the ministry was rendered still less of a warlike temper. A negotiation for peace was entered into with France, which offered, for that end, to give up almost all her colonial possessions. The demands of the British were, however, rather more exorbitant than France expected, and not only was the treaty broken off, but Spain commenced those hostilities which Mr Pitt had foreseen. Nevertheless, Britain continued that splendid career of conquest, which, except at the beginning, had been her fortune during the whole of this war. In a very few months, Spain lost Havannah, Manilla, and all the Philippine Isles. The Spanish forces were also driven out of Portugal, which they had unjustly invaded; and on sea the British fleets reigned every where triumphant, and at no former period was the country in so proud a situation. The ministry, however, were sensible that war, even with all this good fortune, was a losing game, and they therefore, much against the will of the nation, concluded a peace in February 1763.

By this treaty, Great Britain gave up a certain portion of her conquests, in exchange for others which had been wrested from her; but on the whole she was nevertheless a gainer to an immense amount. She acquired from the French, Canada, that part of Louisiana east of the Mississippi, Cape Breton, Senegal, the Islands of Grenada, Dominica, St Vincent's, and Tobago, with all the acquisitions which the French had made upon the Coromandel coast in the East Indies since 1749. From Spain she acquired Minorca, East and West Florida, with certain privileges of value. The continental powers in alliance with Great Britain were also left as they had been. These advantages on the part of Great Britain had been purchased at the expense of an addition of sixty millions to the national debt, which amounted in all to £133,253,270.

HISTORY OF GREAT BRITAIN AND IRELAND,

FROM THE PEACE OF 1763 TILL THE YEAR 1840.

TRANSACTIONS IN IRELAND.

...n the pacification at Limerick, Ireland had been ...d exclusively by the Protestant party, who, under ...influence of feelings arising from local and religious ...ctions, had visited the Catholics with many severe... These measures naturally rendered the Catholic ...ntented subjects, and led to much turbulence. ...common people of that persuasion, being denied ...ccess to justice, took it into their own hands, and ...ired those lawless habits for which they have since ...remarkable. Treachery, cruelty, and all the lower ...ions, were called into vigorous exercise. The passing of a bill in 1719 by the English Parliament, declaring the power to legislate for Ireland, occasioned general dissatisfaction, and caused the rise of a patriotic party in the Parliament and people of Ireland, who ...med to look to the advantage of the country, as ...guished from that of Great Britain. The discontent of the Tory party mingled with this spirit; and ...ebrated Swift, in 1724, blew it into a flame by ...ere pamphlets, called the *Drapier's Letters*, which ...ensibly decried a new coinage of halfpence, but ...in reality aimed at the English ministry.

The discontents of the Catholics continued unabated, ...the connections of the patriotic party with the ad...ers of the English ministry were carried on with ...greatest keenness in Parliament, when the rebellion ...Scotland (1745) alarmed the government for the ...ety of Ireland. The Earl of Chesterfield, celebrated ...his literary productions, was, in this exigency, sent ...a short time as lord lieutenant, and allowed to hold ...all possible encouragement to the Catholics and ...otic party. By discountenancing party distinc..., and giving the Catholics the full protection of the ..., he so effectually soothed and tranquillised the ...ery, that, while the neighbouring Protestant king... exhibited an army seeking the restoration of a ...ose prince, Ireland, though full of Christians of ... persuasion, and bound to the Jacobite cause by ...y underrood associations, remained perfectly faith... to the Hanover dynasty. When the danger was ..., the earl was recalled, and the former system re...ed. The struggles of the patriots with the English ...erial party were continued with unabated vio... down to the death of George II., without produc... any marked benefit to Ireland, although at one ... the former party gained an ascendancy in the ...ve Parliament.

CASE OF MR WILKES.

...ver since the accession of the Brunswick family in ..., the government had been chiefly conducted by ... Whig party, who formed a very powerful portion ...the aristocracy of England. Walpole, Pelham, New..., and Pitt, had all ruled chiefly through the strength of this great body, who, till a period subsequent to the rebellion of 1745, seem to have had the support of the more influential portion of the people. After that period, when the Stuart claims ceased to have any effect in keeping the crown in check, a division appears to have grown up between the government and the people, which was manifested in various forms even before the demise of George II., but broke out in a very violent manner during the early years of his successor. George III., who had imbibed high notions of the royal prerogative from the Earl of Bute, showed, from the beginning of his reign, an anxious desire to extend the power of the crown, to shake off the influence of the great Whig families, and keep popular force of all kinds within strict limits.

A stranger, with no connexion in the country, a favourite, and moreover a man of unprepossessing manners, the Earl of Bute had neither the support of the aristocracy nor of the people. He was assailed in Parliament, and through the newspapers, with the most violent abuse, the unpopular peace furnishing a powerful topic against him. To this storm he at length yielded, by retiring (April 8, 1763).

Among the public writers who assailed the ministry, none was more virulent than Mr John Wilkes, member for Aylesbury, and editor of a paper entitled the *North Briton*. Mr George Grenville, who succeeded Bute, commenced his career by prosecuting Wilkes for a libel, contained in the forty-fifth number of his paper, in which he had directly accused his majesty of falsehood. The king's messenger, being provided with a general warrant against the editor, printers, and publishers of the *North Briton*, entered the house of Mr Wilkes, and apprehended him. After being examined before the secretaries of state, he was committed to the Tower, and his papers were seized and sealed up. A few days after, he was brought to Westminster Hall by *habeas corpus*, and released by Chief-Justice Pratt, in consideration of his being a member of Parliament. The Parliament ordered the seditious paper to be burnt by the hands of the common hangman—an operation that produced a riot, not in itself dangerous, but serving to discover the angry spirit of the populace. Mr Wilkes was soon after expelled from the House of Commons, and found it convenient to retire to the continent. One result of his case was favourable to the popular cause: a prosecution which he instituted against the secretary of state, on the plea that his seizure was illegal, terminated in a verdict of damages, and a declaration by Chief-Justice Pratt, that general warrants were inconsistent with the laws of England.

AMERICAN STAMP ACT.

The administration of Mr Grenville is memorable for the first attempt to tax the American colonies. An act passed under his influence (March 1765) for im-

posing stamps on those countries, appeared to the colonists as a step extremely dangerous to their liberties, considering that they had no share in the representation. They therefore combined almost universally to resist the introduction of the stamped paper by which the tax was to be raised. Resolutions were passed in the various assemblies of the states, protesting against the assumed right of the British legislature to tax them. Partly by popular violence, and partly by the declarations issued by the local legislative assemblies, the object of the act was completely defeated.

The home government were then induced to agree to the repeal of the act, but with the reservation of a right to impose taxes on the colonies. Between the Stamp Act and its repeal, a change had taken place in the administration: the latter measure was the act of a Whig ministry under the Marquis of Rockingham, which, however, did not long continue in power, being supplanted by one in which Mr Pitt, now created Earl of Chatham, held a conspicuous place. The second Pitt administration was less popular than the first: the Earl of Chesterfield, reflecting on the title given to the minister, at the same time that he sunk in general esteem, called his rise a *fall up stairs*. All the ministries of this period laboured under a popular suspicion, probably not well founded, that they only obeyed the will of the king, while the Earl of Bute, as a secret adviser behind the throne, was the real though irresponsible minister.

At the suggestion of Mr Charles Townsend, a member of the Earl of Chatham's cabinet, it was resolved, in 1767, to impose taxes on the Americans in a new shape, namely, upon British goods imported into the colonies, for which there was some show of precedent. An act for imposing duties on tea, glass, and colours, was accordingly passed with little opposition. Soon after this, Mr Townsend died, and the Earl of Chatham, who had been prevented by illness from taking any share in the business, resigned. The Americans met the new burdens with the same violent opposition as formerly.

THE WILKES TUMULTS.

Early in 1768, a new administration was formed under the Duke of Grafton, a pupil of Chatham, and soon after a new Parliament was called. At the general election, Mr Wilkes re-appeared in England, though a sentence of outlawry still stood against him. He even ventured to become candidate for the county of Middlesex, where he was returned by a large majority. Having previously surrendered to the jurisdiction of the King's Bench, his outlawry was reversed; but by virtue of the verdicts which two courts had given against him, he was subjected to a fine and two years' imprisonment. On his arrest, Mr Wilkes quietly committed himself to the officers of justice, but was forcibly rescued by the populace; and in a riot subsequent to this violence, a young man, who had no participation in the tumult, was killed. During his imprisonment, Mr Wilkes was formally expelled the House, on the pretext that, by the vote of censure passed by the preceding Parliament, he was for ever disqualified from being a representative of the people. This decision incensed a great portion of the community, and the case became identified in their estimation with the liberties of the nation itself. Four times did the county of Middlesex return Mr Wilkes; but the rival candidate, Colonel Luttrell, with only a fourth of the votes, was accepted by the House.

These proceedings occasioned many keen debates in the House of Commons, where an opposition of much talent and ardour of purpose now took up every popular question. Tumults of a dangerous character were constantly taking place; the cry of "Wilkes and Liberty" resounded every where, excepting only in Scotland, his scurrility against the Scotch having rendered him generally detested in that country. Even the municipal bodies and corporations, though usually not easily moved by popular objects, became zealous partisans of Mr Wilkes, and thought it their duty to remonstrate with the king on the high hand with which his ment was conducted. At this agitated time (1 unknown writer, styling himself Junius, comm series of letters in a newspaper, animadvertir most virulent manner on both the men and n of the government. These compositions were t remarkable, as, from the force and elegance style, they were evidently the production of sc son, not only far above the usual character paper writers, but fitted to rank with the first i of his day. The publisher of the newspaper secuted for publishing them; but the author r concealed, and his name, though still an object sity, has never been discovered.

MINISTRY OF LORD NORTH—THE CITY OF LONI REMONSTRANCE.

At the opening of Parliament in January was expected that the conspicuous topic in th speech would be the Middlesex election. The was general when it was found that the king make the least reference to the troubles respec Wilkes. The opposition were enraged at th sight, and moved, as an amendment to the that an inquiry ought to be made into the caus prevailing discontents; on which occasion, James Fox, afterwards so celebrated as a leader, made his first speech in Parliamen amendment was negatived by 254 against 18 showed that the king was quite secure of the of the House of Commons.

At this time, the Duke of Grafton retired f cabinet, and his place was supplied by Lord N of the Earl of Guilford. The new ministry tenth which had existed during as many years, first in which the king might be considered pletely free of the great Whig families, who, Parliamentary influence, had possessed the chi since the Revolution. This was the beginning o of Tory administrations, which, with few and tervals, conducted the affairs of the nation dow close of the reign of George IV.

The supposed injury which the cause of free had sustained from the decision of the House mons, still for a time agitated the public mind. eight peers, including all the great Whig chiefs shire, Rockingham, Grosvenor, Fitzwilliam, Tan King, &c.), besides the Earl of Chatham, made declaration that they should not cease their ef they had obtained full justice to the electors of The city of London, and some other corpora note, presented remonstrances to the king on t subject. The policy of the king and cabinet wear out the public fervour by dignified silen notice was therefore taken of these remons Under the policy of the king, the Wilkes agita time subsided.

THE AMERICAN WAR OF INDEPENDENCE.

Meanwhile, the remonstrances of the Americ nists had induced the ministry to give up all taxes, excepting only that on tea, which it wa mined to keep up, as an assertion of the right liament to tax the colonies. In America, t remaining tax continued to excite as much di as the whole had formerly done, for it was the p of a right to impose taxes which they found fa and not the amount of the tax itself. Their di with the mother country was found to affect tr siderably, and the British merchants were an bring the dispute to a close. The government v induced to grant such a drawback from the Brit on tea, as enabled the East India Company to c article in America at a lower rate than form that the American duty, which was only thr a-pound, did not affect the price. It was never that this expedient would satisfy the colonists, a shipments of tea were accordingly sent out fr British ports. But the principle of the right to

lurked under the concession, and the result only showed how little the sentiments of the Americans were understood.

The approach of the tea cargoes excited them in a manner totally unlooked for in Britain. At New York and Philadelphia, the cargoes were forbidden to land. In Charlestown, where they were permitted to land, they were put into stores, and prohibited from being sold. At Boston, a ship-load, which had been introduced into the harbour, was seized by a lawless mob, and tossed into the sea. This last act of violence was resented by the passing of a bill in Parliament for interdicting all commercial intercourse with the port of Boston, and another for taking away the legislative assembly of the state of Massachusetts. The former measure was easily obviated by local arrangements; and in reference to the latter, a congress of representatives from the various states met at Philadelphia, in September 1774, when it was asserted that the exclusive power of legislation, in all cases of taxation and internal policy, resided in the provincial legislatures. The same assembly denounced other grievances, which have not here been particularly adverted to, especially an act of the British legislature for trying Americans, for treasonable practices, in England. The congress also framed a covenant of non-intercourse, by which the whole utility of the colonies to the mother country, as objects of trading speculation, was at once laid prostrate. The colonists still avowed a desire to be reconciled, on the condition of a repeal of the obnoxious statutes. But the government had now resolved to attempt the reduction of the colonists by force of arms. Henceforth, every proposal from America was treated with a proud silence on the part of the British monarch and his advisers.

The war opened in summer 1775, by skirmishes between the British troops and armed provincials, for the possession of certain magazines. At the beginning there seemed no hope of the contest being protracted beyond one campaign. The population of the colonies was at this time under three millions, and they were greatly inferior in discipline and appointments to the British troops. They possessed, however, an indomitable zeal in the cause they had agreed to defend, and fought with the advantage of being in the country of their friends. At Bunker's Hill, near Boston (June 17, 1775), they had the superiority in a well-contested fight with the British troops, of whom between two and three hundred were killed. At the end of one year, the British government was surprised to find that no progress had been made towards a reduction of the Americans, and sent out an offer of pardon to the colonists, on condition that they would lay down their arms. The proposal only met with ridicule.

On the 4th of July 1776, the American congress took the decisive step of a declaration of their independence, embodying their sentiment in a document remarkable for its pathos and solemnity. During the next two campaigns, the slender forces of the new republic were hardly able any where to face the large and well-appointed armies of Great Britain. Much misery was endured by this hardy people in resisting the British arms. Notwithstanding every disadvantage and many defeats, America remained unsubdued.

The first serious alarm for the success of the contest in America, was communicated in December 1777, by intelligence of the surrender of an army under General Burgoyne at Saratoga. In the House of Commons, the ministers acknowledged this defeat with marks of deep dejection, but still professed to entertain sanguine hopes, from the vigour with which the large towns throughout Britain were now raising men at their own expense for the service of the government. Mr Fox, the leader of the opposition, made a motion for the discontinuance of the war, which was lost by 165 to 259, a much narrower majority than any which the ministry had before reckoned in the Lower House.

In proportion to the dejection of the government, was the elation of the American congress. Little more than two years before, the British sovereign and ministers had treated the petitions of the colonists with silent contempt; but such had been the current of events, that, in 1778, they found it necessary, in order to appease the popular discontent, to send out commissioners, almost for the purpose of begging a peace. As if to avenge themselves for the indignities of 1775, the Americans received these commissioners with the like haughtiness; and, being convinced that they could secure their independence, would listen to no proposals in which the acknowledgment of that independence, and the withdrawal of the British troops, did not occupy the first place. The ministers, unwilling to submit to such terms, resolved to prosecute the war, holding forth to the public, as the best defence of their conduct, the necessity of curbing the spirit of insubordination, both in America and at home, which they described as threatening the overturn of the most sacred of the national institutions.

The rise of Great Britain during the seventeenth and eighteenth centuries, in wealth and military and naval power, had been observed by many of the surrounding states with no small degree of jealousy. France, in particular, had not yet forgiven the triumphant peace which Britain had dictated in 1763. The Americans, therefore, by their emissary, the celebrated Benjamin Franklin, found no great difficulty in forming an alliance with France, in which the latter power acknowledged the independence of the colonists, and promised to send them large auxiliary forces. Viewing the distressed state to which Britain was reduced by the contest, and concluding that the time had arrived to strike a decisive blow for her humiliation, Spain soon after declared war against her; and in 1780, Holland was added to the number of her enemies. Russia then put herself at the head of what was called an Armed Neutrality, embracing Sweden and Denmark, the object of which was indirectly hostile to Britain. So tremendous was the force reared against Britain in 1779, even before all these powers had entered into hostilities, that it required about three hundred thousand armed men, three hundred armed vessels, and twenty millions of money annually, merely to protect herself from her enemies. Even her wonted superiority at sea seemed to have deserted her; and for some time the people beheld the unwonted spectacle of a hostile fleet riding in the Channel, which there was no adequate means of opposing.

It was now obvious to the whole nation, that this contest, upon whatever grounds it commenced, was a great national misfortune; and the Opposition in Parliament began to gain considerably in strength. After some votes, in which the ministerial majorities appeared to be gradually lessening, Mr Dunning, on the 6th of April 1780, carried, by a majority of eighteen, a motion, "that the influence of the crown had increased, was increasing, and ought to be diminished." This was looked upon as a severe censure of the government, considering that the House of Commons was not altogether a popular body, but included many who had seats there only through the influence of the crown, or by the favour of the nobility and gentry.

In the year 1778, an act had been passed, relieving the Roman Catholics in England from some of the severe penal statutes formerly enacted against them. The apprehension of a similar act for Scotland caused the people of that country to form an immense number of associations, with a view to opposing it; and, in the early part of 1779, the popular spirit broke out at Edinburgh and Glasgow in several alarming riots, during which one or two Catholic chapels, and some houses belonging to Catholics, were pillaged and burnt. An extensive Protestant Association was also formed in England, to endeavour to procure the repeal of the English act. This body was chiefly led by Lord George Gordon, a son of the late Duke of Gordon, and member of the House of Commons. In June 1780, an immense mob assembled in London to accompany Lord George to the House of Commons, where he was to present a

petition against the act, signed by 120,000 persons. His motion for the repeal of the act being rejected by a vast majority, he came out to the lobby and harangued the crowd in violent terms, suggesting to them similar acts to those which had taken place in Scotland. The mob accordingly proceeded to demolish the chapels of the foreign ambassadors. Meeting with no effectual resistance, for the magistrates of the city were afraid to take decisive measures against them, they attacked Newgate, released the prisoners, and set the prison on fire. The new prison at Clerkenwell, the King's Bench and Fleet Prisons, and the New Bridewell, were treated in like manner. At one time, thirty-six fires were seen throughout the city. The mob had uncontrolled possession of the streets for five days, pillaging, burning, and demolishing; until the king in council determined to authorise the military to put them down by force of arms. Tranquillity was then restored, but not before upwards of 400 persons were killed and wounded. Many of the ringleaders were convicted and executed. Lord George Gordon was tried for high treason, but acquitted on a plea of insanity, which his subsequent life showed to be well founded. Similar outrages were attempted in other cities, but prevented by the vigour of the magistrates. The chief sufferers from these riots were the party who aimed at political reforms. On the other hand, the king obtained increased respect, in consequence of the firmness he had shown in taking measures for the suppression of the riots.

The states of North and South Carolina, which contained a larger proportion of persons friendly to the British crown than any of the northern states, had submitted, in 1780, to a British army under General Clinton. Next year, the greater part of the troops which had been left in those states were conducted northward by Lord Cornwallis, in the hope of making further conquests; but the consequence was that General Greene, after a series of conflicts in which he greatly distressed various parties of the British troops, regained both Carolinas, while Lord Cornwallis took up a position at Yorktown in Virginia. At this time, General Washington, the American commander-in-chief, to whose extraordinary sagacity and purity of motives the colonists chiefly owed their independence, was threatening General Clinton's army at New York. Clinton tamely saw him retire to the southward, believing that he only meant to make a feint, in order to draw away the British from New York, when he in reality meant to attack Cornwallis. On the 29th of September (1781), Yorktown was invested by this and other corps of Americans and French; and in three weeks more, the British batteries being completely silenced, Lord Cornwallis surrendered, with his whole army. With this event, though some posts were still kept up by British troops, hostilities might be said to have been concluded.

At the next opening of Parliament, many of those who had formerly supported the war, began to adopt opposite views; and, early in 1782, a motion, made by General Conway, for the conclusion of the war, was carried by a majority of nineteen. The necessary consequence was, that, on the 20th of March, Lord North and his colleagues resigned office, after twelve years of continued misfortune, during which the prosperity of the country had been retarded, a hundred millions added to the national debt, and three millions of people separated from the parent state.

As usual in such cases, a new administration was formed out of the Opposition. The Marquis of Rockingham was made prime minister, and Mr Fox one of the secretaries of state. The new ministers lost no time in taking measures for the restoration of peace. Unfortunately for their credit with the nation, Sir George Rodney gained an important victory over the French fleet off the island of Dominica, April 12, 1782, after the ministers had dispatched another officer to supersede him in the command. On this occasion, thirty-seven British vessels encountered thirty-four French, and, chiefly by the dexterous manœuvre of a breach of the enemy's line, gained one of the most complete victories recorded in modern warfare. The trium
eminently necessary, to recover in some mea
national honour, and enable the ministers to
the war upon tolerable terms. In Novembe
sional articles for a peace with the United States
rica, now acknowledged as an independent pow
signed at Paris, and the treaty was conclud
ensuing February. When the American am
was afterwards, for the first time, introduce
British levee, the king received him kindly, a
with a manly frankness, that though he had
last man in his dominions to desire that the
dence of America should be acknowledged, he sh
be the last to wish that that acknowledgment s
withdrawn. War was soon after concluded with
Spain, and Holland, but not without some com
concessions of colonial territory on the part
Britain.

The conclusion of this war is memorable as
of great suffering, arising from the exhaustio
national resources, the depression of comme
the accident of a bad harvest. The principle
sperity were after all found to be so firmly
the country, that, immediately after the first d
had passed away, every department of the state
its wonted vigour; and, during the ensuing t
of peace, a great advance was made in nationa

On the unexpected death of the Marquis of
ham, in July 1782, the king chose as his succe
Earl of Shelburne, who, though nominally a W
not sufficiently inclined to the general measure
party to be agreeable to Mr Fox and other
members of the cabinet. On their consequent
tion, the vacancies were filled up by the friends
burne, among whom was Mr William Pitt, a
son of the Earl of Chatham. This young st
to whom was assigned the office of chancello
exchequer, had already distinguished himself
part he took in the popular proceedings for
of the House of Commons—an object which t
sition and their supporters had for some yea
cated with great zeal, but which soon after
great measure out of public notice.

COALITION MINISTRY.

The present ministry was opposed by two p
very different principles, namely, the adherent
North administration, and the friends of thos
who had lately retired from the cabinet. Th
parties, notwithstanding that they had been op
each other throughout all the late war, coale
factious or ambitious purposes; and, being trit
over the ministry, forced themselves upon th
counsels. Then was formed (April 2, 1783) w
called the Coalition Ministry, in which Lord N
Mr Fox acted together as secretaries of state,
two years had hardly elapsed since the lat
breathed the most violent threats in Parliament
his present associate. A coalition, in which
principle was supposed to be abandoned for the
office, could not be agreeable to the nation, whi
evidently embarrassing to the sovereign. Mr
prepared and carried through the Lower H
famous bill for the regulation of the East Ind
pany, by which all authority was to devolve o
directors chosen by the House of Commons;
words, by which the immense patronage of this
of the empire was to fall into the hands of the n
The India bill, as it was called, was generally s
to aim at fixing the ministry in power beyond
trol of both king and people, and it accordingly
much indignation. His majesty, therefore, ful
dent of support from the people, used his pers
fluence, in no covert way, to induce the House
to reject the bill, and (December 18) sent a me
to demand the seals of office from his over-ar
ministers, appointing Mr Pitt to be the prime
and chancellor of the exchequer of a new cabin
sisting chiefly of his majesty's friends.

e various departments of the state were now thrown
relative position, which had never been known
e, and has never recurred. The king and his mi-
, backed by a decided majority of the public,
opposed by two powerful aristocratic factions in
louse of Commons, who defeated every measure
as introduced, refused the usual supplies, and
again and again resolutions against the continu-
of the present men in office, which they denounced
constitutional. But in the course of a few weeks,
influence of the opposition was sensibly reduced;
ublic sentiment and the power of the court began
e effect even on this intractable body; and when
gth their majority had been worn down to *one*,
happened on a motion by Mr Fox, the king dis-
d the Parliament—a measure which, whatever it
promise to him, he did not previously think
iable. So far were the votes of the coalition from
based on popular support, that in the new elec-
no fewer than one hundred and sixty members
their seats. The new House of Commons was so
rable towards the king and ministry, as to enable
ublic service to go on without further interrup-

LEGISLATIVE MEASURES IN IRELAND.

om the end of the reign of George I., a patriotic
in Ireland, composed of a mixture of Catholics and
stants, had been exerting itself to reduce the in-
ce of the English ministry in their country. The
tance of the American colonists gave a powerful
lus to this body; and, on some alarm of an inva-
of the French, they found a pretext for taking up
, apparently for the protection of the country, but
ality to render themselves formidable to England.
uraged by Parliament, and headed by the princi-
en in the country, the Volunteer Corps, as they
called, held meetings and passed resolutions, in
h they openly avowed their determination, at the
rd of life and fortune, to achieve the indepen-
e of the native legislature, and a complete parti-
ion in the commercial rights of the British. The
rnment, being then too feeble to resist, bowed to
demands. Poyning's law, and others which had
the English Parliament a right to interfere with
nd, were repealed; and acts were passed for the
of *habeas corpus* and the independence of the
es. In November 1783, the volunteers held a
l convention in Dublin, and proposed to urge the
ion of Parliamentary reform; but the government
began to regain strength, and in a short time, by
l measures, it prevailed upon the corps to dissolve.

STRY OF MR PITT—FROM 1784 TO THE COMMENCEMENT OF THE FRENCH REVOLUTION.

hough the favourite minister of a sovereign decidedly
ead to all popular innovations, Mr Pitt continued
rofess his former zeal for a reform in the House of
mons; but, as might be expected, was unable to
g the power of the government to bear upon the
ject. In April 1785, he asked leave of the House
ring in a bill for this object; but it was refused by
rge majority. The desire of Parliamentary reform
ertheless continued to animate a large portion of
community. In 1784, a regular society had been
ituted in Scotland, for the purpose of obtaining such
asure; and in the succeeding year, forty-nine out
he sixty-six boroughs had declared in favour of it.
re were also numerous associations of a similar
racter in England.
a 1786, Mr Pitt established his celebrated but fal-
ous scheme for redeeming the national debt, by
t was called a Sinking Fund. The revenue was at
time above fifteen millions, being about one million
re than was required for the public service. This
ss he proposed to lay aside annually, to lie at com-
nd interest; by which means he calculated that each
lion would be quadrupled at the end of twenty-eight
rs, and thus go a great way towards the object he had in view. To this scheme Mr Fox added the infinitely more absurd amendment, that, when the government required to borrow more money, one million of every six so obtained should be laid aside for the same purpose. The scheme was so well received as to increase the popularity of the minister, and it was not till 1813 that its fallacy was proved.

In the same year commenced the Parliamentary proceedings against Mr Warren Hastings, for alleged cruelty and robbery exercised upon the natives of India during his governorship of that dependency of Great Britain. These proceedings were urged by Mr Burke and other members of the Whig party, and excited so much public indignation against Mr Hastings, that the ministry was obliged, though unwillingly, to lend their countenance to his trial, which took place before Parliament in the most solemn manner, and occupied one hundred and forty-nine days, extending over a space of several years. The result was the acquittal of Mr Hastings.

The king and queen had, in the mean time, become the parents of a numerous family of sons and daughters. The eldest son, George, Prince of Wales, had now for several years been of age, and exempted from the control of his father. He had no sooner been set up in an establishment of his own, than he plunged into a career of prodigality, forming the most striking contrast with the chastened simplicity and decorum of the paternal abode. He also attached himself to the party of the Opposition, though rather apparently from a principle of contradiction to his father, than a sincere approbation of their political objects. The result was the complete alienation of the Prince of Wales from the affections of the king.

In November 1788, an aberration of intellect, resulting from an illness of some duration, was observed in the king, and it became necessary to provide some species of substitute for the exercise of the royal functions. To have invested the Prince of Wales with the regency, appeared the most obvious course; but this would have thrown out the ministry, as it was to be supposed that his royal highness would call the chiefs of his own party to his councils. Mr Fox contended that the hereditary nature of the monarchy pointed out an unconditional right in the prince to assume the supreme power under such circumstances; but Mr Pitt asserted the right of Parliament to give or withhold such an office, and proposed to assign certain limits to the authority of the intended regent, which would have placed the existing ministry beyond his reach. The Irish Parliament voted the unconditional regency to the prince; but that of Great Britain was about to adopt the modified plan proposed by Mr Pitt, when, March 1789, the king suddenly recovered, and put an end to the difficulty. The debates on the regency question show in a very strong light how statesmen will sometimes abandon their most favourite and strongest principles on the call of their own immediate interests.

MISCELLANEOUS CIRCUMSTANCES FROM 1760 TO 1790.

At the beginning of the reign of George III., both the commerce and the manufactures of the country might be considered as in a highly flourishing condition. Scotland was not now, as formerly, exempt from the general prosperity. In that country, since the year 1746, great improvements of various kinds had taken place: the linen manufacture had been much advanced; a trade with the colonies had sprung up; agriculture was undergoing great changes for the better; the Highlands were now peaceful, and throughout the whole country were seen conspicuous symptoms of increasing wealth, and its natural consequence, refinement of manners.

During the first ten years of the reign of George III., some discoveries and inventions were made, by which the prosperity of the whole empire received a new impulse. By the improvements effected in the steam-engine by Mr James Watt, a superior mechanic

power was obtained for the driving of machinery and other purposes. Mr James Hargreaves of Blackburn invented the *spinning-jenny*, a contrivance for abridging the use of hand-labour in the cotton manufacture. Upon this an improvement was afterwards made by Mr Richard Arkwright, who invented what was called the *spinning-frame*, by which a vast number of threads of the utmost fineness were spun with very little aid from hand-labour. A third invention, called the *mule-jenny*, by Mr Crompton of Bolton, came into use some years later; and, finally, the *power-loom* was invented, for superseding hand-labour in weaving. By these means, the cotton manufacture was brought to a pitch of prosperity in Britain, such as no particular branch of manufacture had ever experienced before in any country. The immense wealth produced by it is allowed to have been what chiefly enabled the nation to sustain the great contest in which it was afterwards involved with France. Considering these results, the original condition of the principal persons concerned in improving the manufacture is remarkable. Mr Watt, who gave it a mechanic force in the steam-engine, was an artisan in his early days; Mr Hargreaves was a carpenter; and Mr Arkwright a dresser of hair. The last, who was knighted by George III., left, at his death, nearly a million sterling, realised by the profits of his invention.

The early part of the reign of George III. was distinguished by the discoveries of Captain Cook in the Pacific Ocean, by the formation of many canals for internal navigation, and by the foundation of the Royal Academy for the Promotion of the Fine Arts. This period derives lustre from the admirable paintings of Barry, Blake, Hoppner, and Reynolds. Astronomy was cultivated by Dr William Herschel, who in 1781 discovered the planet Uranus. Chemistry was improved by Dr Joseph Black and Mr Cavendish. The science of medicine was advanced by Dr Cullen of Edinburgh; and natural history by Sir Joseph Banks. In literature, the chief place is due to Dr Samuel Johnson, who had flourished also in the preceding reign. Oliver Goldsmith, Mark Akenside, and William Cowper, were the most eminent poets. History was written in a masterly manner by William Robertson and David Hume; Henry Home, David Hume, and Adam Smith, figure as philosophical writers; Sir William Blackstone wrote on English law; and amongst divines, the most eminent were Bishops Warburton, Jortin, and Hurd.

FRENCH REVOLUTION, AND CONSEQUENT WAR WITH FRANCE.

The country had for several years experienced the utmost prosperity and peace, when it was roused by a series of events which took place in France. The proceedings of the French nation for redressing the political grievances under which they had long laboured, commenced in 1789, and were at first very generally applauded in Britain, as likely to raise that nation to a rational degree of freedom. Ere long, the violence shown at the destruction of the Bastille, the abolition of hereditary privileges, the open disrespect for religion, and other symptoms of an extravagant spirit, manifested by the French, produced a considerable change in the sentiments of the British people. The proceedings of the French were still justified by the principal leaders of Opposition in Parliament, and by a large class of the community; but they inspired the government, and the propertied and privileged classes generally, with great alarm and distrust.

When at length the coalition of Austria and Prussia with the fugitive noblesse had excited the spirit of the French people to a species of frenzy, and led to the establishment of a republic and the death of the king, the British government and its supporters were effectually roused to a sense of the danger which hung over all ancient institutions, and a pretext was found (January 1793) for declaring war against France. A comparatively small body of the people were opposed to this step, which was also loudly deprecated in Parliament by Mr Fox and Sheridan; but all these remonstrances were drowned in the general voice of the nation. At such a crisis, to speak of political reforms in E seemed the height of imprudence, as tending to rage the French. All, therefore, who contin make open demonstrations for that cause, we branded as enemies to religion and civil ord Scotland, Mr Thomas Muir, a barrister, and Mr I an Unitarian clergyman, were tried for seditic sentenced to various terms of banishment. named Skirving, Gerald, and Margarot, were in like manner by the Scottish criminal judg offences which could only be said to derive t racter ascribed to them from the temporary a dental circumstances of the nation. An atte inflict similar punishments upon the English ref was defeated by the acquittal of a shoemaker Hardy; but the party was nevertheless subjecte the apparent concurrence of a large and influen tion of the people, to many minor severities.

After alliances had been formed with the other hostile to France, the British ministers dispat army to the Netherlands, under the command king's second son, the Duke of York, to co-ope reducing the fortresses in possession of the I while the town of Toulon, being inclined to under the authority of the royal family, put its the hands of a British naval commander. At fi French seemed to fail somewhat in their defenc on a more ardently republican party acceding t under the direction of the famous Robespier national energies were much increased, and th of Brunswick experienced a series of disgrac verses. The Prussian government, having adopt views of the condition of France, now began t draw its troops, on the pretext of being unable them; and though Britain gave nearly a millio quarter sterling to induce this power to rema months longer upon the field, its co-operation no further service, and was soon altogether lo the 1st of June 1794, the French Brest fleet su a severe defeat from Lord Howe, with the loss ships; but the republican troops not only dro combined armies out of the Netherlands, but, advantage of an unusually hard frost, invaded H by the ice which covered the Rhine, and reduc country to a republic under their own control. successes of the British were limited to the abov victory, the temporary possession of Corsica and T the capture of several of the French colonies West Indies, and the spoliation of a great quan the commercial shipping of France; against were to be reckoned the expulsion of an army fr Netherlands, the loss of 10,000 men and 60,000 of arms in an unsuccessful descent upon the wes of France, some considerable losses of shipping, increase of annual expenditure from about four nearly forty millions.

In the course of the year 1795, the lower p of the community began to appear violently discon with the progress of the war, and to renew th mands for reform in the state. As the king was p (October 29) to open the session of Parliament, s was thrown into his coach, and the interference horse guards was required to protect his perso an infuriated mob. The ministers consequent tained acts for more effectually repressing seditio for the dispersion of political meetings. They w the same time compelled to make a show of yield the popular clamours for peace; and commenced gotiation with the French Directory, which was b off by the refusal of France to restore Belgi Austria. In the ensuing year, so far from any ad being made towards the subjugation of Franc northern states of Italy were overrun by its a and formed into what was called the Cisalpine Re The celebrated Napoleon Bonaparte made his firs spicuous appearance as the leader of this expe which terminated in Austria submitting to a hu ing peace. At the close of 1796, a French fleet for Ireland, with the design of revolutionising

untry, and detaching it from Britain; but its object as defeated by stress of weather. At this crisis, a new ttempt was made to negotiate with the French Republic; but as the events of the year had been decidedly favourable to France, a renewed demand of the ritish for the surrender of Belgium was looked upon s a proof that they were not sincere in their proposals, nd their agent was insultingly ordered to leave the rench territory. To add to the distresses of Britain, hile Austria was withdrawn from the number of her es, Spain, by a declaration of war in 1797, increased n no inconsiderable degree the immense force with hich she had to contend.

THREATENED INVASION.—SUBSEQUENT EVENTS.

For some time an invasion of Britain had been hreatened by France; and, sacred as the land had en for centuries from the touch of a foreign enemy, e successes of the republicans had hitherto so greatly nnulled all previous calculation, that the execution of eir design did not appear improbable. Just as the nterference of the neighbouring powers had, in 1792, used the energies of the French, so did this proposed asion stimulate the spirit of the British people. The murs of reformers, and of those who were friendly to ance, were now lost in an almost universal zeal for the fence of the country; and not only were volunteer ps every where formed, but the desire of prosecut- the war became nearly the ruling sentiment of the ion. The ministers, perceiving the advantage which s to be derived from the tendency of the national rit, appeared seriously to dread an invasion, and s produced an unexpected and very distressing re- t. The credit of the Bank of England was shaken; un was made upon it for gold in exchange for its es, which it could not meet. On the 25th of Febry 1797, therefore, the bank was obliged, with the ction of the privy-council, to suspend cash payts, that is, to refuse giving coin on demand for the per money which had been issued. This step led to great depreciation in the value of Bank of England es, and a very serious derangement of the currency sued for a number of years.

In April, a new alarm arose from the proceedings the seamen on board the Channel fleet, who mutinied r an advance of pay, and the redress of some alleged grievances. A convention of delegates from the various ips met in Lord Howe's cabin, and drew up petitions the House of Commons and the Board of Admiralty. pon these being yielded to, order was restored; but e seamen on board the fleet at the Nore soon after roke out in a much more alarming revolt; and, on e refusal of their demands, moored their vessels cross the Thames, threatening to cut off all communiation between London and the open sea. The reduction of this mutiny appeared at one time as if it could nly be effected by much bloodshed; but by the firmness of the government, and some skilful dealings with e seamen, a loyal party was formed, by whom the ore turbulent men were secured, and the vessels restored to their officers. The ringleaders, the chief of hom was a young man named Richard Parker, were ried and executed.

The same year was remarkable for several victories gained by the British fleets. A Spanish fleet of twenty-seven ships was attacked by fifteen vessels under Admiral Jervis (February 14), off Cape St Vincent, and completely beaten, with the loss of four large vessels. A fleet under Admiral Harvey, with a military force under Sir Ralph Abercromby, captured the island of Trinidad, a Spanish colony. In October, a Dutch fleet, under Admiral De Winter, was attacked off the village of Camperdown, upon their own coast, by Admiral Duncan, who, after a desperate battle, captured nine of the enemy's vessels. These naval successes compensated in some measure for the many land victories of the French, and served to sustain the spirit of the British nation under this unfortunate contest.

In 1798, the French overran and added to their dominions the ancient republic of Switzerland, which gave them a frontier contiguous to Austria, and enabled them eventually to act with increased readiness and force upon that country. In this year, the directors of the French republic, beginning to be afraid of the ambition of their general, Bonaparte, sent him at the head of an expedition to reduce and colonise Egypt, intending from that country to act against the British empire in the East Indies. The expedition was successful in its first object; but the fleet which had conveyed it was attacked in Aboukir Bay, by Admiral Nelson (August 1), and almost totally destroyed or captured. While so much of the strength of the French army was thus secluded in a distant country, the eastern powers of Europe thought they might safely recommence war with the republic. Austria, Naples, and Russia, formed a confederacy for this purpose; and Britain, to supply the necessary funds, submitted to the grievance of an income tax, amounting in general to ten per cent., in addition to all her previous burdens.

The new confederacy was so successful in 1799, as to redeem the greater part of Italy. A Russian army, under the famous Suwaroff, acted a prominent part in the campaign, but, in the end, attempting to expel the French from Switzerland, this large force was nearly cut to pieces in one of the defiles of that mountainous country. In August of the same year, Great Britain made a corresponding attempt to expel the French from Holland. Thirty-five thousand men, under the Duke of York, formed the military part of the expedition. The fleet was successful at the first in taking the Dutch ships; but the army, having landed under stress of weather at an unfavourable place for their operations, was obliged, after an abortive series of skirmishes, to make an agreement with the French, purchasing permission to go back to their country by the surrender of 8000 prisoners from England.

The reverses which France experienced in 1799, were generally attributed to the weakness of the Directory—a council of five, to which the executive had been intrusted. Bonaparte suddenly returned from his army in Egypt, and, by a skilful management of his popularity, overturned the Directory, and caused himself to be appointed the sole depositary of the executive power of the state, under the denomination of First Consul. He immediately wrote a letter to King George, making overtures of peace, but was answered, by the British secretary, that no dependence could be placed by Great Britain on any treaty with France, unless her government were again consolidated under the Bourbons. Bonaparte, having much reason to wish for peace, made a reply to this note, vindicating France from the charge brought against her, of having commenced a system of aggression inconsistent with the interests of other states, and asserting her right to choose her own government—a point, he said, that could not decently be contested by the minister of a crown which was held by no other tenure. But the British government was at this time too much elated by the expulsion of the French army from Italy, and the late changes in the executive, which, in their estimation, betokened weakness, to be immediately anxious for peace.

The events of 1800 were of a very different nature from what had been calculated upon in England. Sir Sidney Smith, who commanded the British forces in Syria, had made a treaty with the French army after it had been left by Bonaparte, whereby it was agreed that the French should abandon Egypt, and retire unmolested to their own country. The British government, in its present temper, refused to ratify this arrangement; and the consequence was a continuance of hostilities. The French overthrew a large Turkish army at Grand Cairo, and made themselves more effectually than ever the masters of the country, so that Britain was obliged to send an army next year, under Sir Ralph Abercromby, to accomplish, at an immense expense and a great waste of human life, what the French had formerly agreed to do. In Europe the presence of Bonaparte produced equally disastrous re-

sults. By one of his most dexterous movements, he eluded the Austrians, led an army over the Alps by the Great St Bernard into the Milanese, and, having gained a decisive victory at Marengo (June 14), at once restored the greater part of Italy to French domination. Contemporaneously with Napoleon's movements, Moreau led another army directly into Germany, overthrew the Austrians in several battles, and advanced to within seventeen leagues of Vienna. These reverses obliged Austria next year to make a peace, by which France became mistress of all Europe west of the Rhine and south of the Adige.

REBELLION IN IRELAND—UNION WITH GREAT BRITAIN.

Although the government had been able, in 1783, to procure a dissolution of the volunteer corps, the bulk of the Irish people continued to express the most anxious desire for such a reform in their parliament as might render it a more just representation of the popular voice. Unable to yield to them on this point, Mr Pitt endeavoured to appease them by extending their commercial privileges; but his wishes were frustrated, chiefly by the jealousy of the British merchants. A strong feeling of discontent, not only with the government, but with the British connexion, was thus engendered in Ireland.

The commencement of the revolutionary proceedings in France excited the wildest hopes of the Irish. Towards the close of the year 1791, they formed an association, under the title of the United Irishmen, comprehending persons of all religions, and designed to obtain "a complete reform of the legislature, founded on the principles of civil, political, and religious liberty." The government from the first suspected this association of meditating an overturn of the state, and took strong measures for keeping it in check. Acts were passed for putting down its meetings, and the secretary, Mr Hamilton Rowan, was tried, and sentenced to a fine and two years' imprisonment for what was termed a seditious libel. At the same time, some concessions to the popular spirit were deemed indispensable, and the Irish parliament accordingly passed acts enabling Catholics to intermarry with Protestants, to practise at the bar, and to educate their own children.

On discovering that a treasonable correspondence had been carried on with France by some leading persons in the society of United Irishmen, the government was so much alarmed as to send (1794) a Whig lord-lieutenant (Earl Fitzwilliam) to grant further concessions; but, ere any thing had been done, the ministers were persuaded by the Protestant party to return to their former policy. The patriotic party now despaired of effecting any improvement by peaceable means, and an extensive conspiracy was entered into for delivering up Ireland to the French republic. The scheme was managed by a directory of five persons, and though half a million of men were concerned in it, the most strict secrecy was preserved. In December 1796, a portion of the fleet which had been fitted out by the French to co-operate with the Irish patriots, landed at Bantry Bay; but measures for a rising of the people not being yet ripe, it was obliged to return. Next year, the losses at Camperdown crippled the naval resources of France, and prevented a renewal of the expedition. Losing all hope of French assistance, the conspirators resolved to act without it; but their designs were betrayed by one Reynolds; and three other members of the directory, Emmet, Macnevin, and Bond, were seized. Notwithstanding the precautionary measures which the government was thus enabled to take, the Union persisted in the design of rising on a fixed day. Lord Edward Fitzgerald, another of its leaders, was then arrested and, being wounded in a scuffle with his cap- soon after died in prison. On the 21st of May rd Castlereagh, secretary to the lord-lieutenant, he whole plan of insurrection, which had been mmence on the 23d.

hus thwarted in their designs, and deprived *t leaders, the* conspirators appeared in arms in various [illegible] untry. Parties attacl and Carlow, [illegible] ulsed with loss. A lar under a priest named [illegible]rphy, appeared in th of Wexford, and ton- [illegible]e city of that name insurrections about [illegible]same time broke ou northern counties of Antrim and Down, but we suppressed. In Wexford alone did the insurr pear in formidable strength. Under a prie Roche, a large party of them met and defeated of the government troops; but, on a second though they fought with resolution for four ho were compelled to retreat. Another defeat Ross exasperated them greatly, and some m cruelties were consequently practised upon t soners. On the 20th of June, their whole f collected upon Vinegar Hill, near Enniscorth an army of 13,000 men, with a proportionate artillery, was brought against them by Gener They were completely overthrown and dispers this time the rebellion languished, and in Ju so far ceased to be formidable, that an act of was passed in favour of all who had been en it, except the leaders.

On the 22d of August, when the rebellion h completely extinguished, 900 French, under Humbert, were landed at Killala, in the opp tremity of the country from that in which the in had shown the greatest strength. Though to be of any decisive effect, they gave some troub government. A much larger body of Britis under General Lake, met them at Castlebar, treated in a panic. They then advanced to th of the country, while the lord-lieutenant confi formidable reputation which their countrymen quired, by concentrating an immensely dispro force against them. On the 8th of Septemb were met at Carrick-on-Shannon by this lar to which they yielded themselves prisoners of

During the ensuing two years, the British exerted themselves to bring about an incor union of Ireland with Great Britain; a measure the Irish were almost universally opposed, bu by the use of bribes and government patron rally employed amongst the members of the Iri lature, was at length effected. From the 1st of 1801, the kingdom of Ireland formed an essen of the empire, on which was now conferred t of the United Kingdom of Great Britain and The act of union secured to the Irish most of t mercial privileges which they had so long sough a comparison of the aggregate exports and im the two countries, Ireland was to raise two revenue for every fifteen raised by Great Britai the first twenty years of the union, after wh regulations were to be made by Parliament hundred commoners were to be sent by Irelan British (now called the Imperial) Parliament, two for each county, two for each of the cities lin and Cork, one for the university, and one f of the thirty-one most considerable towns. Fo spiritual, by rotation of sessions, and twenty-eig temporal, elected for life by the Peers of Irela to sit in the House of Lords.

The Union, though upon the whole effected in of fairness towards Ireland, increased the disco the people, which broke out in 1803 in a new i tion. Under Robert Emmett and Thomas Ri conspiracy was formed for seizing the seat of t government, and for this purpose a great mult peasantry from the county of Kildare assemble 23) in Dublin. Disappointed in their attempt u castle, they could only raise a tumult in the str the course of which Lord Kilwarden, a judge, nephew, Mr Wolfe, were dragged from a carri killed. The mob was dispersed by soldiery, a mett and Russell, being seized, were tried and ex

CHANGE OF MINISTRY, AND PEACE OF AMIENS, 1

At the commencement of 1801, Britain had

this unexpected turn of fortune, but to reckon r enemies the whole of the northern states of which had found it necessary to place them- friendly footing with Bonaparte, and, though ot declare war against Britain, yet acted in anner as to render hostilities unavoidable. iled in March, with a large fleet for Copen- d proved so successful against the Danish reduce that country to a state of neutrality. of the Russian Emperor Paul, which took e same time, and the accession of Alexander, friendly to Britain, completely broke up the confederacy. Yet the great achievements of the continent, joined to the distresses of a hich at this time bore hard on the British oduced a desire for that peace which, a year ight have been gained upon better terms. ew, apparently, to save the honour of Mr Pitt riends, a new ministry was appointed under gton, by whom a peace was at length, in the e year (1801), concluded with France, which the state of aggrandisement which has just ribed.

r of the French Revolution placed Great Bri- session of a considerable number of islands ies in the East and West Indies and elsewhere; only two war ships had been lost on her had taken or destroyed 80 sail of the line, 181 nd 224 smaller ships belonging to the enemy, ith 743 privateers, 15 Dutch, and 76 Spanish he triumphs of the British fleets were indeed and splendid, and had the effect of keeping al commerce almost inviolate during the whole r, while that of France was nearly destroyed. s, however, hardly the most trifling instance by land; and the expenses of the contest enormous. Previously to 1793, the sup- lly voted by the House of Commons were 00; but those for 1801 were £42,197,000, ble the amount of the whole land-rent of the

WED WITH FRANCE, 1803.—SUBSEQUENT EVENTS.

only one of the results of the war against dependence, that France was led by the course to place herself under the control of her chief enius, Napoleon Bonaparte; a man singularly or concentrating and directing the energies try in the existing condition of France, but more by personal ambition than by any ex- ws of the good of his species. It was soon hat Bonaparte did not relish peace. By taking antage of several points left loose in the treaty, ed Great Britain to retaliate by retaining of Malta; and the war was accordingly re- d in May 1803. Britain immediately em- r superior naval force to seize the French a colonies; while France took possession of and excluded British commerce from Ham- Bonaparte collected an immense flotilla at for the avowed purpose of invading England; porous were the preparations made by the tish population, and so formidable the fleet d Nelson, that he never found it possible to sign in execution. In the year 1804, he was the dignity of Emperor of the French; and ce more exhibited the formalities of a court, t of the kind which the European sovereigns see established. In April of the same year, gton administration was exchanged for one d by Mr Pitt, and of which he formed the

, under the fostering influence of Great Bri- r coalition of European powers, consisting of weden, Austria, and Naples, was formed poleon. He, on the other hand, had drawn a his side, and was making great exertions ing with Britain the empire of the sea. A irty-three sail, partly French and partly Spanish, met a British fleet of twenty-seven, under Nelson, off Cape Trafalgar, October 25, 1805, and was completely beaten, though at the expense of the life of the British commander. Britain thus fixed permanently her dominion over the seas and coasts of the civilised world. At this time, however, Napoleon was asserting with equal success his supremacy over continental Europe. By a sudden, rapid, and unexpected movement, he conducted an army into Germany, where the Austrians were already making aggressions upon neutral territory. On the 17th October, he took the fortress of Ulm, with its artillery, magazines, and garrison of 30,000 men; a month after, he entered Vienna without resistance. He then pursued the royal family, and the allied armies of Russia and Austria, into Moravia; and, on the 2d of December, he gained the decisive victory of Austerlitz, which put an end to the coalition, and rendered him the dictator of the continent.

This series of events caused much gloom in the British councils, and with several other painful circumstances, among which was the impeachment of his colleague Lord Melville, for malpractices in the Admiralty, proved a death-blow to Mr Pitt, who expired on the 23d of January 1806, completely worn out with state business, at the early age of forty-seven, half of which time he had spent in the public service. Mr Pitt is universally allowed the praise of high talent and patriotism. But his policy has been a subject of dispute between the two great parties into which British society is divided. By the Tories it is firmly believed, that his entering into the war against the French republic was the means of saving the country from anarchy and ruin; by the Whigs, that this step only tended to postpone the settlement of the affairs of France, and loaded Britain with an enormous debt. Of the absence of all selfish views in Mr Pitt, there can be no doubt; for, so far from accumulating a fortune out of the public funds, he left some debts, which Parliament gratefully paid.

Mr Pitt's ministry was succeeded by one composed of Lord Grenville, Mr Fox, and their friends; it was comprehensively called Whig, although Lord Grenville was in every respect a Tory, except in his advocacy of the claims of the Catholics for emancipation. In the course of 1806, the new cabinet made an attempt to obtain a peace from France, which now threatened to bring the whole world to its feet. But the Grenville administration encountered serious difficulties from the king, who never could be induced to look with the least favour on the Catholic claims, or those who advocated them. Exhausted by his useless labours, Mr Fox died, September 13, 1806. Few names are more endeared to the British people than his, for, though the leader of the Whigs, he never excited any rancour in his opponents. He was remarkable for his frankness and simplicity. His abilities as a parliamentary orator and statesman were of the first order, and he was invariably the consistent and sincere friend of popular rights.

A new coalition, excluding Austria, but involving Prussia, had been subsidised by Britain, and was now preparing to act. With his usual decision, Napoleon led what he called his "Grand Army" by forced marches into Prussia; gained, on the 14th of October, the battles of Jena and Averstadt, which at once deprived that country of her army, her capital, and her fortresses; and then proclaimed the famous "Berlin Decrees," by which he declared Great Britain in a state of blockade, and shut the ports of Europe against her merchandise. The King of Prussia, Frederick William III., took refuge with his court in Russia, which now was the only continental power of any importance that remained unsubdued by France.

Towards that country Napoleon soon bent his steps, taking, as he went, assistance from Poland, which he promised to restore to independence. After a series of skirmishes and battles of lesser importance, he met the Russian army in great strength (June 14, 1807), at Friedland, and gave it a total overthrow. He might

now have easily reduced the whole country, as he had done Austria and Prussia; but he contented himself with forming a treaty (called the treaty of Tilsit, from the place where it was entered into), by which Russia agreed to become an ally of France, and entered into his views for the embarrassment of Britain by the exclusion of her commerce from the continental ports. France had thus, in the course of a few years, disarmed the whole of Europe, excepting Great Britain, an amount of military triumph for which there was no precedent in ancient or modern history.

The Grenville administration was displaced in spring 1807, in consequence of the difference between its members and the king on the subject of the Catholic claims, which had long been urged by the Whig party, with little support from the people. The next ministry was headed by the Duke of Portland, and included Lords Hawkesbury and Castlereagh (afterwards Earl of Liverpool and Marquis of Londonderry), and Mr Canning, as secretaries; Mr Spencer Perceval being chancellor of the exchequer. After being accustomed to the services of such men as Pitt and Fox, the people regarded this cabinet as one possessing comparatively little ability. One of its first acts was the dispatch of a naval armament to Copenhagen, to seize and bring away the Danish shipping, which was expected to be immediately employed in subserviency to the designs of France, and for the injury of Britain. The end of the expedition was easily gained; but it was the means of lowering the honour of Britain in the eyes of foreign states.

FIRST PENINSULAR CAMPAIGN.—SUBSEQUENT EVENTS.

The retaliation of France, for the interferences of other powers with its revolution, even supposing such retaliation justifiable, was now more than completed. Further measures could only appear as dictated by a desire of aggrandisement. But France was now given up to the direction of a military genius, who had other ends to serve than the defence of the country against foreign aggression or interference. The amazing successes of Napoleon had inspired him with the idea of universal empire; and so great was the influence he had acquired over the French, and so high their military spirit, that the attainment of his object seemed by no means impossible. There was a difference, however, between the opposition which he met with before this period, and that which he subsequently encountered. In the earlier periods of the war, the military operations of the European powers were chiefly dictated by views concerning the interests of governments, and in which the people at large felt little sympathy. Henceforth a more patriotic spirit rose every where against Napoleon: he was looked upon in England and elsewhere as the common enemy of humanity and of freedom; and every exertion made for the humiliation of France was animated by a sentiment of desperation, in which the governors and governed alike participated.

The Spanish peninsula was the first part of the prostrated continent where the people could be said to have taken a decidedly hostile part against Napoleon. He had there gone so far as to dethrone the reigning family, and give the crown to his elder brother Joseph. A sense of wrong and insult, mingled with religious fanaticism, raised the Spanish people in revolt against the French troops; and though their conduct was every where barbarous in the extreme, it was hailed in Britain as capable of being turned to account. In terms of a treaty entered into with a provisional government in Spain, a small army was landed, August 8, 1808, in Portugal, which had been recently taken possession of by the French. Sir Arthur Wellesley, who afterwards became so famous as Duke of Wellington, was the leader of this force. In an engagement at Vimeira, on the 21st, he repulsed the French, under Junot, who soon after agreed, by what was called the Convention of Cintra, to evacuate the country. Sir Arthur being recalled, the British army was led into Spain under the command of Sir John Moore; but this officer found the reinforcements poured in by Napoleon too great to be withstood, and accord in the end of December, he commenced a disa though well-conducted retreat towards the p Corunna, whither he was closely pursued by M Soult. The British army suffered, on this occ the severest hardships and losses, but did not rience a check in battle, or lose a single standar a battle which took place at Corunna, Janua 1809, for the purpose of protecting the embarka the troops, Sir John Moore was killed.

Much of the public attention was about thi engrossed by circumstances in the private life eldest son of the king. The Prince of Wales ha tempted, in 1796, by the prospect of having his debts paid by the nation, to marry the Princess line of Brunswick, for whom he entertained no tion. Almost ever since the marriage, he had the most marked disrespect for his consort, wh sequently, lived separate from him, and was l considered by many as deficient in her conduc matron.

In 1809, Austria was induced once more to mence war with France. Upwards of half a mil men were brought into the field, under the comm the Archduke Charles. Bonaparte, leaving Spai partatively open to attack, moved rapidly forwar Germany, and, by the victory of Echmuhl, open the way to Vienna, which surrendered to him. gaining a slight advantage at Essling, the ar came to a second decisive encounter at Wagram, the strength of Austria was completely brok pieces. The peace which succeeded was sealed marriage of Napoleon to Maria Louisa, daughter Emperor of Austria, for which purpose he di his former wife Josephine.

In the autumn of 1809, the British governme patched an armament of 100,000 men, for the p of securing a station which should command the gation of the Scheldt. The expedition was placed the command of the Earl of Chatham, elder bro Mr Pitt, a nobleman totally unacquainted with m affairs on such a scale. The army, having disem on the insalubrious island of Walcheren, was sw in thousands by disease. The survivors retur December without having done any thing towa object for which they set out. This tragical affair l the subject of inquiry in the House of Commons, by a majority of 272 against 232, vindicated the r in which the expedition had been managed.

SUCCESSES OF WELLINGTON IN SPAIN.

A new expedition in Spain was attended with success. Taking advantage of the absence of N in Austria, a considerable army was landed, A 1809, under the command of Sir Arthur We who immediately drove Soult out of Portugal, a made a rapid move upon Madrid. King Jose vanced with a considerable force under the co of Marshal Victor; and, on the 28th of July, a the British and Spanish troops in a strong pos Talavera. The contest was obstinate and sang and though the French did not retreat, the ad lay with the British. As this was almost the fi cess which Britain experienced by land in the of the war, Sir Arthur Wellesley became the t universal praise, and he was elevated to a p under the title of Viscount Wellington of T He was obliged immediately to fall back upon P where he occupied a strong position near Santa

Early in 1810, Napoleon reinforced the a Spain, and gave orders to Massena to "drive t tish out of the peninsula." Wellington posted hi on the heights of Busaco—eighty thousand in n including Portuguese—and there, on the 27th tember, was attacked by an equal number of Both British and Portuguese behaved well: the were repulsed with great loss, and, for the first the war, conceived a respectful notion of the troops. Wellington now retired to the lines of

though intended to be retaliatory, only increased the evil, no vessel belonging to a neutral power—such, for instance, as the United States—was permitted to carry goods to those ports, unless they should previously land and pay a duty in Britain. Thus the nation at once suffered from the shortsighted despotism of the French emperor, and from its own narrow and imperfect views of commerce; for, by embarrassing America, it only deprived itself of one of its best and almost sole remaining customers.

The power of Bonaparte, though sudden in its rise, might have been permanent, if managed with discretion. It was used, however, in such a way as to produce a powerful reaction throughout Europe in favour of those ancient institutions, which, twenty years before, had been threatened with ruin. The exclusion of British goods—a measure which he had dictated in resentment against England—proved the source of great distress, oppression, and hardship throughout the continent, and was greatly instrumental in exciting a spirit of hostility against him. The very circumstance of a foreign power domineering over their native princes, raised a feeling in favour of those personages, which, being identified with the cause of national independence, acted as a very powerful stimulant. On the other hand, a sense of the grasping ambition of Napoleon—of his hostility to real freedom—of his unscrupulousness in thrusting away the lives of his subjects for his own personal aggrandisement—had for some time been gaining ground in France itself.

In 1812, when the transactions in Spain had already somewhat impaired Napoleon's reputation, Alexander, Emperor of Russia, ventured upon a defiance of his decrees against British merchandise, and provoked him to a renewal of the war. With upwards of half a million of troops, appointed in the best manner, he set out for that remote country, determined to reduce it into perfect subjection. An unexpected accident defeated all his plans. The city of Moscow, after being possessed by the French troops in September, was destroyed by incendiaries, so that no shelter remained for them during the ensuing winter. Napoleon was obliged to retreat; but, overtaken by the direst inclemency of the season, his men perished by thousands in the snow. Of his splendid army, a mere skeleton regained central Europe. Returning almost alone to Paris, he contrived with great exertions to reinforce his army, though there was no replacing the veterans lost in Russia.

Early in 1813, he opened a campaign in northern Germany, where the Emperor of Russia, now joined by the King of Prussia and various minor powers, appeared in the open field against him. After various successes on both sides, an armistice was agreed to on the 1st of June, and Bonaparte was offered peace on condition of restoring only that part of his dominions which he had acquired since 1805. Inspired with an overweening confidence in his resources and military genius, he refused these terms, and lost all. In August, when the armistice was at an end, his father-in-law, the Emperor of Austria, joined the allies, whose forces now numbered 500,000 men, while an army of 300,000 was the largest which Napoleon could at present bring into the field. Henceforth he might be considered as overpowered by numbers. By steady though cautious movements, the allies advanced to France, driving him reluctantly before them, and increasing their own force as the various states became emancipated by their presence. At the close of 1813, they rested upon the frontiers of France, while Lord Wellington, after two successful campaigns in Spain, had advanced in like manner to the Pyrenees.

HOME AFFAIRS.—WAR WITH AMERICA.

Some changes had in the mean time taken place in the British administration. On the 11th of May 1812, the premier, Mr Perceval, was shot in the lobby of the House of Commons, by a man named Bellingham, whom some private losses had rendered insane. Lords Liverpool and Castlereagh then became the ministerial leaders.

in the two Houses of Parliament, but were quickly voted down by a majority of four, upon a motion made by Mr Stuart Wortley, afterwards Lord Wharncliffe. The ministry was finally rendered satisfactory to Parliament by the admission of Earl Harrowby as president of the council, Mr Vansittart as chancellor of the exchequer, and Lord Sidmouth (formerly premier while Mr Addington) as secretary for the home department; Lord Liverpool continuing as premier, and Lord Castlereagh as foreign and war secretary.

Notwithstanding the successes which were at this period brightening the prospects of Britain, the regent and his ministers did not enjoy much popularity. The regent himself did not possess those domestic virtues which are esteemed by the British people, and he had excited much disapprobation by the steps which he took for fixing a criminal charge upon his consort. The general discontents were increased by the effects of the orders in council, for prohibiting the commerce of neutral states. Vast multitudes of working people were thrown idle by the stagnation of manufactures, and manifested their feelings in commotion and riot. The middle classes expressed their dissatisfaction by clamours for Parliamentary reform.

At this unhappy crisis, provoked by the orders in council, as well as by a right assumed by British war-vessels to search for and impress English sailors on board the commercial shipping of the United States, that country (June 1812) declared war against Britain. Before the news had reached London, the orders had been revoked by the influence of Lord Liverpool; but the Americans, nevertheless, were too much incensed to retrace their steps. During the summer and autumn, several encounters took place between single American and British ships, in which the former were successful. It was not till June 1, 1813, when the Shannon and Chesapeake met on equal terms, that the British experienced any naval triumph in this war with a kindred people. On land, the Americans endeavoured to annoy the British by assaults upon Canada, but met with no decisive success. The British landed several expeditions on the coast of the States; and were successful at Washington, at Alexandria, and at one or two other points, but experienced a bloody and disastrous repulse at New Orleans. The war ended, December 1814, without settling any of the principles for which the Americans had taken up arms. But, while thus simply useless to America, it was seriously calamitous to Britain. The commerce with the States, which amounted in 1807 to twelve millions, was interrupted and nearly ruined by the orders in council, and the hostilities which they occasioned: henceforth America endeavoured to render herself commercially independent of Britain, by the encouragement of native manufactures —a policy not immediately advantageous, perhaps, to herself, but decidedly injurious to Great Britain. The fatal effects of the Berlin and Milan decrees to Napoleon, and of the orders in council to the interests of Britain, show how extremely dangerous it is for any government to interfere violently with the large commercial systems upon which the immediate interests of their subjects depend.

PEACE OF 1814.—SUBSEQUENT EVENTS.

At the close of 1813, it was evident that Bonaparte could hardly defend himself against the vast armaments collected on all hands against him. Early in 1814, having impressed almost every youth capable of bearing arms, he opposed the allies on the frontiers with a force much less numerous and worse disciplined. Even now he was offered peace, on condition that he should only retain France as it existed before the Revolution. But this proposition was too humiliating to his spirit to be accepted; and he entertained a hope that, at the worst, his father-in-law, the Emperor of Austria, would not permit him to be dethroned. Two months were spent in almost incessant conflict with the advancing allies, who, on the 30th of March, entered Paris in triumph; and, in the course of a few days, ratified a treaty with Napoleon, by which he agreed to resi government of France, and live for the future a sovereign of Elba, a small island in the Mediterr

In the measures for settling France, Great B concurred by her representative Lord Castlereag attended the allies during the campaign of 1814 peace was proclaimed in London on the 20th of France was deprived of all the acquisitions gaine under the republic and the empire, and restored rule of the ancient royal family in the person of XVIII. The Emperor of Russia and the K Prussia visited England in June, and were re with all the honours due to men who were cons as the liberators of Europe. Wellington, now c a duke, received a grant of L.400,000 from the of Commons, in addition to one of L.100,000 ously voted; and had the honour to receive i son the thanks of the house for his services. B sentatives from the European powers concerned war met at Vienna, October 2, in order to set disturbed limits of the various countries, and p against the renewal of a period of war so disa Throughout the whole arrangements, Great B acted with a disinterested magnanimity, which her great sufferings and expenses, could hardl been looked for, but was highly worthy of the ei name which she bore amidst European nations.

In March 1815, the proceedings of the co were interrupted by intelligence that Napoleo landed in France, and was advancing in triumph capital. He had been encouraged by various favo circumstances to attempt the recovery of his th and so unpopular had the new government alrea come, that, though he landed with only a few m was every where received with affection, and 20th of March, was reinstated in his capital, whi that morning been left by Louis XVIII. The sovereign had granted a charter to his people, by he and his successors were bound to rule under restrictions, and with a legislature composed chambers, somewhat resembling the British Ho Parliament. Bonaparte now came under simi gagements, and even submitted to take the votes nation for his restoration, on which occasion he million and a half of affirmative, against less tha a million of negative voices, the voting being per by ballot. His exertions to reorganise an arm successful to a degree which showed his extraor influence over the French nation. On the 1st o he had 559,000 effective men under arms, of 217,000 were ready to take the field.

A Prussian army of more than 100,000 men, Blucher, and one of about 80,000 British, Ge and Belgians, under Wellington, were quickly r voused in the Netherlands, while still larger arm Austrians and Russians, making the whole force a million, were rapidly approaching. These pr to make war, not on France, but against Bon alone, whom they denounced as having, by his of the treaty, "placed himself out of the pale o and social relations, and incurred the penalty o mary execution." Napoleon, knowing that his e would accumulate faster in proportion than h troops, crossed the frontier on the 14th of Jun 120,000 men, resolved to fight Blucher and Wel separately, if possible. The rapidity of his move prevented that concert between the Prussian an lish generals which it was their interest to est On the 16th, he beat Blucher at Ligny, and com him to retire. He had, at the same time, intru Marshal Ney the duty of cutting off all connex tween the two hostile armies. His policy, thou fully acted up to by his marshals, was so far succ that Blucher retired upon a point nearly a day's from Wellington.

After some further fighting next day, Na brought his whole forces to bear, on the 18th, a Wellington alone, who had drawn up his troops the road to Brussels, near a place called Waterlo

THE PRINCESS CHARLOTTE.—POPULAR TUMULTS.

...May 1816, the Princess Charlotte, only child of ...Prince Regent, was married to Prince Leopold of ...-Coburg, a young officer who had gained her affec...s when attending the allied sovereigns at the British ...rt. In November 1817, to the inexpressible grief ...he whole nation, the young princess died, immedi...y after having given birth to a dead son.

...August 1816, a British armament under Lord ...mouth bombarded Algiers, and reduced that pirati...state to certain desirable conditions respecting the ...ment of Christian prisoners.

...he year 1816, and the four following years, will ...ys be memorable as an epoch of extraordinary dis..., affecting almost every class of the community. ...liberation of European commerce at the end of the ..., produced a proportionate diminution of that trade ...ch England had previously enjoyed, through her ...usive possession of the seas. While all public bur...s continued at their former nominal amount, the ...es of every kind of produce, and of every kind of goods, had fallen far below the unnatural level to which a state of war and of paper money had raised them; and hence the expenses of the late contest, which had never been felt in the fictitious prosperity then prevalent, came to press with great severity upon the national resources, at a time when there was much less ability to bear the burden. To complete the misery of the country, the crop of 1816 fell far short of the usual quantity, and the price of bread was increased to an amount more than double what has since been the average rate.

Tumultuary proceedings took place in various parts of the country; and a desire for a reform in the House of Commons, which was supposed to be the only means of reducing the public expenditure, began to take deep root among the lower orders, and produced tumultuary excesses in the metropolis. The government then adopted expedients for counteracting the force of the popular spirit. They endeavoured to make it appear that an extensive conspiracy had been formed for the overthrow of the government. Of the four rioters charged with high treason, a conviction was obtained only against one. Such unanimity, however, prevailed between the ministry and the Parliament, that, at the close of February (1817), an act was passed for the suspension of the Habeas Corpus Act. Many persons were imprisoned, and detained for some time at the will of the ministers.

A temporary revival of prosperity occurred in 1818, but was quickly followed by renewed distress. In the autumn of 1819, the misery of the working classes had reached its greatest height, and still parliamentary reform was demanded as the only measure which could permanently improve their prospects. On the 12th of July, at a public meeting in the unrepresented town of Birmingham, an attorney was elected to proceed to Westminster, and openly claim to be received as a member of Parliament. On the 16th of August, a vast body of operatives assembled at Manchester, in an open space of ground called St Peter's Field, for a similar purpose, though professedly to petition for parliamentary reform. As they came in regular array, bearing banners with inscriptions, the magistrates professed to consider the meeting as dangerous to the public peace, and accordingly, ere the proceedings were far advanced, a body of troops, consisting chiefly of yeomanry, dashed into the mass, trampling down many persons of both sexes under the horses' feet, and killing and wounding others with their sabres. The meeting was dispersed by these means, and Messrs Hunt and Johnston, the principal orators, were apprehended. The tragic nature of this event, and its appearing as an invasion of the popular right of meeting for redress of grievances, produced some marks of public resentment; but the magistrates who conducted the attack received the immediate and cordial thanks of the government.

When Parliament reassembled in November, there was an evident increase of attachment to the ministry; and, in addition to the strong measures already taken for suppressing popular discontent, acts were passed to suppress unstamped political publications, to prevent secret training to arms, and to restrict the right of calling a public meeting to magistrates.

The year 1819 was remarkable, among other things, for the provision made, by act of Parliament, for the resumption of cash payments at the bank.

On the 20th of January 1820, George III. died at Windsor, in his eighty-second year, without having experienced any lucid interval since 1810. The Prince Regent was immediately proclaimed as GEORGE IV.; but there was no other change to mark the commencement of a new reign. A few days after the decease of George III., the Duke of Kent, his fourth son, died suddenly, leaving an infant daughter, Victoria, with a very near prospect to the throne.

MISCELLANEOUS CIRCUMSTANCES FROM 1790 TO 1820.

Owing to the superiority of Britain at sea, she was able to preserve her commerce during the war, while

that of France was comparatively ruined. This circumstance, combined with the remarkable effects of machinery in various manufactures, and the great improvements effected in agriculture, maintained the prosperity of the country during a contest which otherwise must have sunk her as low as it did Austria and Prussia. The value of the exports, which had been fifteen millions in 1760, and had only advanced to twenty in 1790, was, in 1802, *forty-six millions*.

This period is above all things memorable for the introduction of the use of steam in navigation. A model vessel, with a small steam-engine on board, was tried in 1788 by Mr Patrick Miller of Dalswinton in Dumfriesshire. Soon after, a vessel on a larger scale was exhibited in perfect action on the Forth and Clyde Canal. The idea fell asleep for a few years, but was revived by Mr Fulton, an American, who, in 1807, set agoing a steam-vessel on the Hudson River, the first in the world which was regularly employed in conveying passengers. In 1812, Mr Henry Bell of Helensburgh launched a similar vessel on the Clyde, being the first seen in Europe; and from that period steam-vessels quickly became numerous. Their superiority, in propelling vessels without regard to wind or tide, was in time universally acknowledged; and ultimately they have been used in voyages across large oceans.

In this period, considerable efforts were made for the more general education of the people. Sunday schools, first suggested by Mr Raikes of Gloucester, overspread the whole country, and proved the means of instructing many children who otherwise would have remained altogether ignorant. A plan of teaching great numbers of children, by employing the best pupils as monitors or assistants, was originated by Dr Bell and Mr Joseph Lancaster, and widely introduced. Two great societies were formed for the purpose of setting up and supporting schools in the districts where they were most needed. This period also beheld the rise of various societies, whose object it was to send missionaries to convert the heathen in distant lands, and to disseminate Bibles both at home and abroad. Great efforts were at the same time made in Britain to put an end to slavery in the West India colonies.

The latter part of the reign of George III. was also distinguished by great improvements in the dress and social condition of the people. Old fashions gradually disappeared, and the more simple and agreeable costume of the present day came into use. In the year 1750, cocked hats, wigs, swords, and buckles, were generally worn, and all gentlemen used hair powder. From the year 1790 to about 1800, these and many other oddities completely disappeared. Speedy travelling by stage-coaches, and the rapid transmission of letters by mail-carriages, became at the same time general in all parts of the United Kingdom.

At no period did a more brilliant class of literary men exist. Poetry assumed new and attractive forms in the works of Campbell, Moore, Southey, Wordsworth, Byron, and Scott. The novel or fictitious tale was advanced to a dignity it had never known before, in consequence of the production, by Sir Walter Scott, of a series of such compositions, in the highest degree dramatic and entertaining. In the Edinburgh and Quarterly Reviews, periodical criticism acquired an importance it never before possessed. At the same time, the more grave walks of divinity, history, and travels, were filled by a respectable body of writers. The name of Sir Humphry Davy stands pre-eminent in science, which was also cultivated with distinguished success by Wollaston, Leslie, Playfair, and Robison. In philosophical literature, the names of Dugald Stewart and Thomas Brown ask for peculiar respect.

REIGN OF GEORGE IV.

At the time when George IV. commenced his reign, the Manchester affair and the recent proceedings of the ministry, had inspired a small band of desperate men with the design of assassinating the ministers at a binet dinner, and thereafter attempting to set them-

s as ; ...visional government. On th
... 18... ... w ... surprised by the p
t ... ...l, after a desperate re
... ... hom one Thistlewood
... ...en were tried for hi
... and ex... ...rly about the same t
...mpt was made by the workmen in the west
l to bring about some alteration in the sta
... men were executed.

...n the accession of the king, his consort's n
...been omitted from the liturgy. This and othe
...nit es induced her to return from a voluntary
...y, June 1820, to the great embarrassmen
... ... and his ministers. Her majesty, who h
...been befriended by the Opposition, was receive
people with the warmest expressions of sy
Whatever had been blameable in her conduct w
looked on account of the greater licentiousnes
ascribed to her husband, and the persecution
she had suffered for twenty-four years. The ki
had established a system of observation rou
majesty during her absence from the country,
a bill of pains and penalties against her to be
(July 6) into the House of Lords, which thus
a court for her trial. Messrs Brougham and L
who afterwards attained high judicial stations,
counsel for her majesty, and displayed great d
and eloquence in her defence. The examin
witnesses occupied several weeks; and nothing
undone which might promise to confirm her n
guilt. But no evidence of criminality could so
indignation with which almost all classes of th
munity regarded this prosecution. Though
was read a second time by a majority of 28 in
of 216, and a third time by 108 against 99, the
ment considered it expedient to abandon it, lea
queen and her partisans triumphant.

In July 1821, the coronation of George IV. to
under circumstances of great splendour. On th
sion, the queen made an attempt to enter West
Abbey, for the purpose of witnessing the ceremo
was repelled by the military officers who guar
door; an insult which gave such a shock to her
as to cause her death in a few days. During the
of August, the king paid a visit to Ireland, w
was received with much cordiality by all classes
excitable people, notwithstanding his known
to the Catholic claims. In September, he pai
to the kingdom of Hanover. In August of the
year, he completed this series of visits by a vo
Scotland, where, owing to the novelty of the o
and the historical associations which it was the
of awakening, he was also received with extren
ness. During his absence in Scotland, his leadi
ster, the Marquis of Londonderry (formerl
Castlereagh) put an end to his own life, in conse
of a morbid sense of the difficulty of his positio
gard to continental affairs. The successor of th
quis of Londonderry in the direction of foreig
was Mr George Canning, who had quitted the
two years before on account of the prosecution
queen, and was at this time preparing to leave th
try as governor-general of India. Mr Cannin
statesman of enlightened and humane spirit, and
other popular qualities, possessed a rich and
style of parliamentary eloquence.

JOINT-STOCK MANIA.—COMMERCIAL EMBARRASSM

The two ensuing years were characterised by
traordinary activity in almost all departments
and commerce. Mr Huskisson, an able com
minister introduced by Mr Canning, originated
measures highly important; especially the repe
duties on goods passing between Great Brit
Ireland—an alteration in the duties affecting
manufacture—the repeal of the combination la
of the law against the emigration of artisans; w
executive formed commercial treaties, on the
city system, with various countries of Euro

...owledging the independence of the revolted Spanish ...ies in America, drew them as additional customers ... the British market.

...ital now so far exceeded the ordinary means of ...ployment, that many joint-stock companies were ...ed, as a means of giving it a wider range than that ...hich it was usually limited. Some of these associa... professed objects which were by long-established ... the proper business of individuals alone, and ...e fraudulent boundless and visionary projects, which ... to be carried into effect in remote countries. The ...ased state of trade in 1824 and 1825, had led to a ...ortionate importation and production of goods, and ... succeeded by an advance of prices in 1825. The ...quence was a sudden and unusually active demand, ... powerful reaction of supply, which did not cease ... productions had far exceeded the bounds of moderation.

Through the facilities afforded by large issues of ... money, the delusion was kept up longer than it ... otherwise have been. The first symptom of ...thing being wrong, was the turning of the exchange ...st England. A diminution of issues at the bank ...ued. Merchants began to feel a difficulty in ... pecuniary obligations. Then took place a run ... the banks, some of which, both in London and in ...ntry, were obliged to stop payment. Between ...ber 1825 and February 1826, fifty-nine commissions of bankruptcy were issued against English country ..., and four times the number of private compositions were calculated to take place during the same ...d. While the merchant and manufacturer were ...out credit, their inferiors were without employment, ...distress reached almost every class of the community.

Some liberal pecuniary measures on the part of ...k of England, helped in a short time, rather by ...ring confidence than by actual disbursement of ..., to retrieve, in some measure, the embarrassed ...mstances of the country.

SIR CANNING'S ADMINISTRATION.—CATHOLIC EMANCIPATION.

...e spring 1827, the illness of Lord Liverpool (followed soon after by his death) opened the way for Mr ...ning's promotion to the first place in the administration; an occasion, for various reasons of a ...onal as well as political character, the more uncompromising class of Tories resigned their places, leaving ...ns of government in the hands of a comparatively ...ular party. Mr Canning, however, sank under the ... had imposed upon him, and died in the ensuing ...mer. His friend Lord Goderich succeeded as premier; but resigned in January 1828, when the Duke ...Wellington was appointed in his place, with Mr ...rwards Sir) Robert Peel as secretary for the home ...rtment.

...rom the year 1805, the Catholic claims had been ...minent subject of parliamentary discussion, and ...e 1821 they had been sanctioned by a majority in ... House of Commons. Almost despairing of their ..., while left to the progress of mere opinion in the ...lish aristocracy, the Irish Catholics had in 1824 ...ed themselves in an association, with the scarcely ...ealed purpose of forcing their emancipation by ...ns of a terrifying exhibition of their physical ...gth. An act was quickly passed for the suppression of this powerful body; but it immediately reappeared in a new shape. In fact, the impatience of the ...olic population of Ireland under the disabilities ... degradation in which they were subjected on account of religion, was evidently becoming so very great, ... there could be little hope of either peace or public ...er in that country till their demands were conceded. ...ugh the English public lent little weight to the agitation, and the king was decidedly hostile to its object, ...olic emancipation rapidly acquired importance with ... classes, and in all parts of the empire. In spring ..., a kind of preparation was made for the concession, by the repeal of the test and corporation oaths, ...ch had been imposed in the reign of Charles II.

The ministry soon after received an alarming proof of the growing force of the question. Mr Vesey Fitzgerald had vacated his seat for the county of Clare, on becoming president of the board of trade. He was a friend to emancipation, and possessed great influence in the county; but he was also a member of an anti-Catholic administration. As an expedient for annoying the ministry, the Catholic Association, and all the local influences on that side, were set in motion to procure the return of Mr Daniel O'Connell, the most distinguished orator of the Catholic party. To the surprise of the nation, Mr O'Connell was returned by a great majority. It was even surmised that the laws for the exclusion of Catholics from Parliament would be unable to prevent him from taking his seat. The Duke of Wellington now began to see the necessity of taking steps towards a settlement of this agitating question; and the first, and most difficult, was to overcome the scruples of the sovereign. At the opening of the session of 1829, in consequence of a recommendation from the throne, bills were introduced by ministers for removing the civil disabilities of Catholics, and putting down the Catholic Association in Ireland; and, notwithstanding a great popular opposition, as well as the most powerful exertions of the elder and more rigid class of Tories, this measure was carried by a majority of 353 against 180 in the House of Commons, and 217 to 112 in the House of Lords.

REIGN OF WILLIAM IV.

The agitations respecting the Catholic Relief Bill had in some measure subsided, when, June 26, 1830, George IV. died of ossification of the vital organs, and was succeeded by his next brother, the Duke of Clarence, under the title of WILLIAM IV. About a month after, a great sensation was produced in Britain by a revolution which took place in France, the main line of the Bourbon family being expelled, and the crown conferred upon Louis-Philippe, Duke of Orleans. By this event, a great impulse was given to the reforming spirit in Britain, and the demands for an improvement in the parliamentary representation became very strong. The consequence was the retirement of the Wellington administration in November, and the formation of a Whig cabinet, headed by Earl Grey. The agitations of the time were much increased by a system of nocturnal fire-raising, which spread through the south of England, and caused the destruction of a vast quantity of agricultural produce and machinery.

The Whig ministry came into power upon an understanding that they were to introduce bills for parliamentary reform, with reference to the three divisions of the United Kingdom. These, when presented in March 1831, were found to propose very extensive changes, particularly the disfranchisement of boroughs of small population, for which the members were usually returned by private influence, and the extension of the right of voting in both boroughs and counties to the middle classes of society. The bills accordingly met with strong opposition from the Tory, now called the Conservative party. By a dissolution of Parliament, the ministry found such an accession of supporters as enabled them to carry the measure through the House of Commons with large majorities; but it encountered great difficulties in the House of Lords, and it was not till after a temporary resignation of the ministry, and some strong expressions of popular anxiety respecting reform, that the bills were allowed to become law.

During the few years which followed the passing of the Reform Bills, the attention of Parliament was chiefly occupied by a series of measures which a large portion of the public deemed necessary for improving the institutions of the country, and for other beneficial purposes. The most important of these, in a moral point of view, was the abolition of slavery in the colonies, the sum of twenty millions being paid to the owners of the negroes, as a compensation for resigning a right of property which had long been a disgrace to humanity. By this act, eight hundred thousand slaves were (August 1,

1834) placed in the condition of freemen, but subject to an apprenticeship to their masters for a few years.

In the same year, an act was passed for amending the laws for the support of the poor in England, which had long been a subject of general complaint. One of the chief provisions of the new enactment established a government commission for the superintendence of the local boards of management, which had latterly been ill conducted, and were now proposed to be reformed. The able-bodied poor were also deprived of the right which had been conferred upon them at the end of the eighteenth century, to compel parishes to support them, either by employment at a certain rate, or pecuniary aid to the same amount: they were now left no resource, failing employment, but that of entering poor-houses, where they were separated from their families. The contemplated results of this measure, were a reduction of the enormous burden of the poor-rates, which had latterly exceeded seven millions annually, and a check to the degradation which indiscriminate support was found to produce in the character of the labouring classes.

On the renewal of the charter of the East India Company in 1834, the government deprived it of its mercantile privileges, and extended the right of trading with China to the community at large. The ancient policy of not allowing Europeans to settle in Hindostan was also departed from, under some restrictions of inferior importance. Some reforms, equally advantageous to the public, were effected in the administration of the law, and in the privileges held by the Bank of England.

In 1833, a reform took place in the mode of electing the councils and magistracies of the Scottish boroughs. Instead of regulations which took their rise in an early age, and had been found productive of mismanagement, the parliamentary constituencies were empowered, in all except a few cases, to choose the requisite number of councillors, to whom then belonged the duty of appointing the requisite number out of their own body to act as magistrates. In 1835, the English municipal corporations were reformed, upon a principle similar to that applied to Scotland, except that the rate-payers and freemen were designed to form the electoral bodies, and that the councils in most cases were to consist of a greater number of members. A modified reform of the same kind took place in Ireland, by virtue of an act passed in 1840.

During the summer of 1834, the ministry endeavoured to carry through Parliament a bill to enable them to take unusual measures for restraining turbulence in Ireland. In consequence of a difficulty experienced in passing the measure, Lord Althorp and Earl Grey resigned their situations. The earl, who had now passed his seventieth year, was anxious for other reasons to retire from more active life, in order to spend the remainder of his days in the bosom of his family. He withdrew with the admiration of all parties, his whole career having been marked by consistency and sincerity. His place was supplied by Viscount Melbourne, and Lord Althorp was induced to resume office. The Irish Coercion Bill, with certain alterations, was then passed. On the 10th of October in this year, the two Houses of Parliament were burnt by accident.

In November, the death of Earl Spencer caused the advancement of his son Lord Althorp to the House of Peers, and the ministry was then left without a leader in the House of Commons. The king, who had for some time inclined to the Conservative party, took advantage of this circumstance to dissolve the cabinet. The Duke of Wellington was again called into office, and a messenger was dispatched to Italy to bring Sir Robert Peel home from that country, in order to accept the premiership. Sir Robert hastened to London, and on the 10th of December, the new ministry was constituted, chiefly of the individuals who lost office in Sir Robert, though sensible of the difficulty of public affairs at such a time, resolved to do so conciliate popular favour, by entering upon reforming measures. In a new House of mons, his party was strengthened by nearly a h new votes; but he was still in a minority. After ing forward a variety of measures of a reformi racter, being defeated on the question of devotin part of the Irish church revenues to education, compelled to resign (April 8, 1835), and allow th bourne ministry to be replaced.

In the session of 1836, the ministry were defea majorities in the House of Lords, in attempts t several important measures of reform, but suc in passing an act for commuting tithes in Engla a corn rent-charge payable in money; also in for enabling dissenters in England to be married wise than by the established clergy; and anothe general registry of births, deaths, and marriages. likewise reduced the stamp-duty on newspapers penny, by which the circulation of that class of cations was very largely increased. From this there was a marked diminution in the zeal whi for some years been manifested for changes in t tional institutions. Early in 1837, the ministry introduced into the House of Commons a bill f tling the Irish tithe question; but before this other measure of importance had been carried, t died of ossification of the vital organs (June 20), seventy-third year of his age, and seventh of his being succeeded by his niece, the Princess V who had just completed her eighteenth year. T ceased monarch is allowed to have been a consci and amiable man, not remarkable for ability, the same time free from all gross faults.

COMMENCEMENT OF THE REIGN OF QUEEN VICTOR

The commencement of the reign of Queen V has been marked by no signal events, and may [February 1841] be rather considered as a pe promise than of performance. Meanwhile, her r appears to have given unmixed satisfaction people by her marriage to Prince Albert of Cobourg, and the birth of a princess-royal.

MISCELLANEOUS CIRCUMSTANCES FROM 1820 TO 1

This period is remarkable for the great efforts were made to diffuse knowledge more generally a the people. *Mechanics' Institutions* were for most considerable towns, for the purpose of inst that class of the community in mechanical and science. Various periodical works were also set a for the purpose of communicating science and branches of instruction, in such forms as to be gible to the less educated classes. At the same considerable efforts were made to still farther education by means of ordinary schools. Among individuals who sought to promote these objec most conspicuous was Lord Brougham, who fil office of Lord Chancellor in the Grey administr

In this period, the national energies were turned towards the arts of peace, and accordin prosperity of the country made, upon the whole advances. Though agricultural produce had to bring the high prices it realised during the w farmers paid rents nearly equally high; and th were enabled to do in consequence of the soil been so much improved as to produce much crops. During this period steam navigation w mensely increased; ordinary roads were grea proved by the mode of paving invented by Mr Ma and railways began to overspread all parts of th try, for the conveyance of goods and passeng means of steam locomotive carriages, the commo of which is about thirty miles an hour. These stances form the fair side of the picture: on the we behold discontents pervading large sections working population, on account of the low w labour, and other real or imaginary grievances.

CONSTITUTION AND RESOURCES OF THE BRITISH EMPIRE.

...British Empire consists of the United Kingdom of ...eat Britain and Ireland (including a number of ...ller islands around their shores), and colonies and ...er dependencies in different quarters of the world. ...e most remarkable peculiarity in the political con... of the British empire, is the high degree of civil ...d religious liberty which all classes of subjects prac...lly enjoy. Slavery exists in no quarter of the ...itish dominions: personal freedom, with liberty to ...e and go, unquestioned and unimpeded, is assured ...ll, without respect of birth, rank, language, colour, ...religion.

Britain, while in population and some other respects ...passed by several other nations, possesses a degree ...wealth and political influence which may be said to ...se her at the head of all nations. This unprece...ented affluence and power appears to have taken its ...se in a fortunate concurrence of favouring circum...nces, some of a physical and others of a moral cha...acter.

The first of the physical causes in importance is un...estionably the insular situation, at once protecting ...e country from the destructive invasions which have ...much depressed and retarded many continental ...ons, and furnishing opportunities for a ready com...erce with all the shores of the civilised world. The ...cond of these causes is to be found in the natural fer...ity of a large portion of the United Kingdom, and ...e temperate climate enjoyed by it, favouring the pro...uction of the food necessary for a large population. ...e third cause is the large amount of the mineral wealth ...England, furnishing her with the means of prose...ting manufactures to an extent beyond all which the ...rld has ever before had experience of. Thus Britain ...s been naturally qualified to become the seat of a ...ge agricultural, manufacturing, and commercial na...n, and must always, from the nature of things, have ...ntinued to assume that character. Moral causes, it is ...e, might have been unfavourable. Had a branch ...f the Ethiopian or Mongolian races possessed the ...untry, its natural advantages would probably have ...remained unused. But the stock of the British popula...n chances to have sprung from the Teutonic branch ...f the Caucasian variety, a race who have in many ...ountries proved the superiority of their intellectual ...nd moral organisation. The idea of trial by jury, and ...f arranging public affairs by a representative body, ...pon at an early period by this race, show that it ...possesses a natural aptitude for forming improved poli...al institutions. Its concern in the most important ...odern inventions shows its ingenuity in the arts. Its ...aritime enterprise and mercantile intrepidity were ...splayed at a time when other nations were engaged ...ly in feudal broils. Planted in England in the fifth ...entury, and probably in Scotland many centuries be...re, we see this people making a continual advance ...ver since in political institutions and in the arts of peace. Historians point out the accidents which effected conspicuous changes; but, while the feebleness and wickedness of a John may have been the immediate cause of the Magna Charta, and the passion of Henry VIII. for a beautiful woman the proximate cause of the reformation of religion, there must have also been something in the people pressing them irresistibly towards liberty of person and of conscience, and enabling them to overcome all obstacles to the accomplishment of those objects. It was in the nature of the people to establish free institutions—and they were established. A people so active and so ingenious could not fail to take advantage of the natural facilities which they enjoyed for manufactures and commerce. They made the best of blades in the days of Cœur de Lion, and in the time of Elizabeth their sails whitened every neighbouring sea. Arts, driven out of other countries by ruthless bigotry, found refuge and flourished amongst a people who eagerly grasp at every kind of employment which promises to be useful. It is to their persevering industry, exercised by favour of so many natural circumstances, and constantly protected by free institutions, that we are mainly and most immediately to look for the source of the greatness of the British empire.

FORM OF THE BRITISH GOVERNMENT.

The government of the United Kingdom is constitutional, or possesses a regular form, in which the civil rights of all classes are acknowledged and guaranteed. The constitution is a monarchy, in which the sovereign accepts of his dignity under an express agreement to abide by certain prescribed forms of government according to the laws of the realm, and to maintain inviolate the Protestant religion, with all the rights and privileges of the church. The sovereign is the head or directing power in the executive of government, the fountain of all honours, and the watchful guardian of the interests of the state: he is held to be incapable of doing wrong; and if an unlawful act is done, the minister instrumental in that act is alone obnoxious to punishment. The legislative part of the government is composed of two deliberating bodies—the House of Lords and the House of Commons, both of which consist of individuals belonging to the United Kingdom only, the colonial dependencies of the empire having no share in the general management.

House of Lords.—The persons who compose the House of Lords form a separate class or rank, which is called collectively the Peerage, and whose members enjoy certain exclusive privileges and honours, which will be explained afterwards. The members of the House of Lords are either lords spiritual or temporal. The spiritual lords are archbishops and bishops, and hold their seats in virtue of their office; the temporal lords enjoy their seats from hereditary right, or in virtue of being elevated to the peerage. In 1837, at the meeting of the first Parliament of Queen Victoria, the number of

members of the House of Lords was 641; namely, 3 princes of the blood royal, 2 English archbishops, 21 dukes, 19 marquises, 112 earls, 19 viscounts, 24 English bishops, 6 Irish prelates, 193 barons, 16 representative peers of Scotland, and 28 representative peers of Ireland. The House of Lords is liable at all times to an increase of number by the elevation of commoners to the peerage; but this prerogative of the crown is sparingly used.

The House of Commons.—This body consists of 658 members; of whom 253 are chosen by counties, 6 by universities, and 399 by cities, boroughs, and towns. England returns 471, Wales 29, Ireland 105, and Scotland 53. The number of persons entitled to vote in the election of these members is probably about a million; of whom about 600,000 vote for county members, 5000 for representatives of universities, and 400,000 for members for cities, boroughs, and towns. The great bulk of the voters, as settled by the Reform Acts of 1832, is composed of the agricultural tenantry and the occupants of houses of L.10 of yearly rent; in other words, the middle classes. The operative classes, from their not in general inhabiting houses of such value, possess little direct influence in the election of members of the House of Commons. A House of Commons cannot legally exist for more than seven years; but, in reality, it rarely exists so long, the death of the sovereign, change of ministry, and other circumstances, causing a renewal on an average every three or four years. Reckoning from 1802 till November 15, 1837, there were thirteen Houses of Commons; as the thirteenth still exists (January 1841), we have an average of three years for each: those of longest duration were the fourth, from 1807 to 1812, and the fifth, from 1812 to 1818.

The Houses of Lords and Commons compose the *Parliament.* The Parliaments of England and Scotland were united in 1707, and then called the British Parliament. In 1800, the Irish Parliament merged in the British Parliament. The three kingdoms were first represented in one Parliament in 1801. Since that period it has been called the *Imperial Parliament*, and is always convened at Westmin-ter.

The two houses, with the sovereign, compose the three estates of the realm, or legislative body. The sovereign takes no personal concern in the proceedings of Parliament, further than opening or proroguing the sessions; but the interests of the crown in Parliament are intrusted to members of the cabinet council or ministry, and by them are defended and explained. The two houses, with the sovereign, have the power to pass laws, impose taxes, borrow money, make inquiries into the management of the public revenues, or the transactions of the great officers of government, and even to bring the latter to trial, if necessary. Members of either house inquire into the manner in which all great public institutions or boards of management are conducted, such as those for education, for purposes of charity, for the erection of lighthouses on the coast, for the construction of harbours, and generally, indeed, into all the business which is intrusted to the executive part of the government; they cannot direct what is to be done, but may always make scrutiny into it afterwards, if any error or mismanagement has taken place. The discussions on these subjects are often very warm and eager, and bring to light facts of great public importance. No act of the two deliberative bodies becomes valid as a law, without the assent of the sovereign; and all propositions relating to money to be raised for the public service, must originate with the House of Commons, the Lords merely giving their assent as a matter of form, without being allowed to alter any thing. This circumstance gives a much larger share of influence to the Commons than is possessed by the Lords; the former having it in their power, whenever they are dissatisfied with the measures of government, to stop the supplies of money, and bring the whole machinery to a stan-.

Each of the two houses has one presiding member, whose duty it is to preserve order and see t gulations of the assembly are attended to b bers; he is also the person through whom an cation passes between the house and the que having the privilege of addressing her maje of the house. Hence, in the House of Cor officer is called the *Speaker;* in the House is commonly known as the *Lord Chanc* another office which he holds; but the d latter are quite the same as those of the Spe Commons. There are numerous forms est the regularity of business in Parliament, b there are only a few which need be ment Any proposal which is laid before either of in order to pass into a law, must be made promoter *in the form* of an act of Parlian only known by the name of a *bill* while un sion: permission must first be obtained t the bill, and it must then be read and co the house three several times, besides being tinised more closely by a committee or sele of the members, and, if a public bill, by the sitting as a committee, when each member i to speak as frequently as he sees occasion, the regular sittings of the house no one is speak more than once, except to explain wh statements have been misunderstood. If it jected in any of these three readings, or g the committee, the bill is said to have passe then go through the same process in the o where it is sometimes adopted, sometimes re if any alterations are made on it here, th reported to the house where it first originat two cannot agree on the changes proposed, to the ground; but some modification is ger trived which satisfies both parties. It still obtain the sanction of the sovereign, whic ever refused, when the *bill* becomes an *act ment* or *law.*

The members of both houses have certa privileges, which are deemed necessary fo them properly to attend to their public Parliament, they enjoy absolute freedom and cannot be questioned out of the hou thing said in the debates; they and their s exempted from arrest (except in criminal ca their attendance in Parliament.

The Executive, as already stated, is repo hands of a sovereign. The dignity of the s hereditary in the family of Brunswick, r throne, and in the person of either a male A queen reigning, therefore, enjoys the s leges as a king. Besides enforcing the l realm, through the medium of courts of j a variety of functionaries, the sovereign with the office of levying taxes granted for service, and of defending the empire a abroad against foreign enemies. He, or reference to our present sovereign), also c intercourse with the rulers of other nation treaties and alliances, declaring war or peace. She has the duty of protecting the p trade of British subjects in foreign countries purpose, she has the sole appointment of who perform these duties; of judges in t courts of law; of officers in the army and public ambassadors, and of consuls at foreig the safety of trade; and of the officers wh taxes. She has also large forces, both nava tary, at her disposal, which are stationed i parts of the empire where she or her advisers they are wanted for the time. The task of m these extensive concerns, which would fall tion in the hands of one person, is deputed by to a number of persons, who are denominate *nisters*, and sometimes the *Cabinet.* These nally selected and appointed by the queen h as her choice would be in vain if it were to f who were disagreeable to Parliament (whic

An ...judiced foreigner would probably remark, that ...greatest drawback from its happy working now is, ...position in which it places the labouring portion of ...community.

FINANCES.

...venue.—The revenue of the British empire has va-...xceedingly of late years; from 1761 to 1774, which ...a period of peace, it increased from L.6,800,000 to ...,073; and since that time, from the various ...s in which the country was engaged, the immediate ...ses, and the interest of public debts, it has conti-... to augment till within these last ten or twelve ...s. From 1775 to 1783, which was the period of ...American war, it rose from ten millions to twelve ...ns; and during the peace which followed till 1793, ...e increased to seventeen and a half millions a-year. ...ter this period the French revolutionary war com-...ced. That war was by no means unpopular with ...ation; and it was besides gilded by the many ...dful victories which continued to be obtained by ...sh seamen as long as the enemy had a fleet to ...er at sea. Heavy taxes for defraying the expenses ...e war were therefore submitted to without remon-...ce, and the public revenue rose accordingly to a ...large amount. From 1794 to the peace of Amiens ...1, which only lasted two years, the revenue was increased from seventeen and a half millions to twenty-eight millions; and from 1803 till 1816, the year after the final conclusion of peace, it had risen to L.76,934,494, which was the largest sum raised by taxes in one year.

The sums thus raised in taxes, large as they were, did not, however, meet the expenditure of the country during these periods of war. In order to defray the great charges which arose, it became necessary also to borrow to a great amount. The following table will show the sums raised by the taxes, the sums borrowed, and the total expenditure for each of the years specified.

Year.	Raised in Taxes.	Borrowed.	Total Expenditure.
1794	L.17,674,355	L.5,079,971	L.22,754,366
1801	28,035,629	33,582,350	61,617,988
1805	36,401,736	25,972,742	62,378,480
1808	53,686,194	22,350,673	76,056,796
1810	66,929,349	22,763,202	89,792,551
1814	70,926,315	52,309,445	122,235,660
1815	72,834,494	54,471,464	130,305,958

These sums will appear altogether enormous, and must give the most extraordinary idea of the resources of a government, which, while it raised such a large yearly amount in taxes, had yet credit to borrow the immense additional sums which were wanted. The whole sum which was expended in the wars of the revolution, from 1794 to 1815, amounted to 1700 millions of pounds sterling—a sum so far beyond all ordinary dealings, that we can have little conception of its amount or value. All the mines that are at present wrought in Europe and America would not furnish gold and silver equal to it in less than 310 years.

The debt formed by borrowing money at different rates of interest to conduct the warlike operations of the country, has risen from small beginnings towards the conclusion of the seventeenth century, to an unparalleled amount. At the revolution of 1688, the national debt amounted to only L.664,263; at the accession of Queen Anne, L.16,394,702; of George I., L.54,145,363; of George II., L.52,092,235; at the end of the Spanish war in 1748, L.78,293,313; at the commencement of war in 1755, L.74,571,040; at conclusion of peace in 1762, L.146,682,644; at commencement of American war in 1776, L.135,583,031; at conclusion of peace in 1783, L.238,434,370; at commencement of French revolutionary war, L.238,733,009; at peace of Amiens in 1801, L.582,839,377; at peace of (Feb. 1) 1816, L.864,822,461; on the 5th of January 1832, L.782,667,234—interest, L.28,341,416. Since 1832, the debt has increased, chiefly by the funding of exchequer bills (adding floating obligations to funded stock), and in 1839, the amount was L.841,000,000, with an interest of L.29,000,000.

The revenue which it is necessary to raise for the purpose of paying the interest of the debt, and conducting the business of the country, is derived from taxation upon a great variety of different articles, which are all, however, reduced to the following heads:—

1. *The Customs.*—These are taxes levied upon the foreign commerce of the country, being the duties paid upon articles imported from abroad, such as tea, sugar, coffee, spirits, wines, tobacco, &c. They include also a few on some goods exported, such as coals, wool, and skins. Their whole amount, in the year ending October 10, 1840, was L.20,152,739.

2. *The Excise.*—The excise taxes are those which are levied on goods of British manufacture, such as glass, malt, paper, &c. The duty is paid back again to the maker, if the commodity is to be exported to foreign countries. This class of taxes yielded, in the above year, L.11,985,467.

3. *Stamp Duties.*—These consist of the prices affixed to stamped papers, upon which the law makes it imperative that every document for the transfer of property, or other obligation, shall be written. Deeds, settlements, and bills, bills of exchange, receipts (above a certain small amount), and a great variety of other instruments of business, are required to be stamped in this manner;

and the prices affixed to the stamps, which are often high, bring a large revenue. Under the head of stamps, are also included newspaper stamps, indentures, dice, duties on plate, and other anomalous items. The whole amounted in the above year to L.6,726,317.

4. *Direct Taxes.*—These are duties levied on land, on windows (eight or upwards), male servants, riding horses, dogs, use of armorial bearings, hair powder, &c. This class of taxes, which are levied by surveyors and collectors, amounted in the above year to L.3,744,372. The principal items are the land and window taxes, each of which was above a million.

5. *Post-Office.*—In the year ending October 1839, the revenue derived from the tax on letters passing through the post-office was L.2,390,764. But, by the reduction of postage to one penny per letter (if under half an ounce) at the beginning of 1840, the amount of revenue derived from this source in the year ending January 1840, was only L.441,000. The great advantage derived by the country from cheap postage more than compensates the deficiency.

6. The income derived from rentals of *crown property*, and the sale of timber, bark, &c., from the crown lands (with other incidents), yielded a revenue, in the year ending October 1840, of L.167,500.

7. *Miscellaneous.*—These include duties on hackney-coaches, hawkers' licenses, offices, pensions, &c.; and amounted to L.84,479.

8. Some *incidental revenues* are derived from matters connected with the regular taxes; such as duties collected at the Isle of Man, fines, and goods seized for taxes; these, with a number of other casual receipts, amounted, in the above year, to L.454,784. Besides this, there was a sum entitled *Repayments of Advances*, amounting to L.656,140.

The total annual income for the year ending October 1840, was L.44,665,798; and it will be observed that of that sum fully thirty-two millions were raised from customs and excise, or duties on foreign and British manufactures, and nearly seven millions on stamps. Thus, the great bulk of taxation is indirect, and the really direct taxes are a mere trifle in comparison. The chief burden of the taxes evidently falls on the consumers of tea, coffee, sugar, tobacco, soap, spirits, and wines, and these consumers are the great body of the people. As the land-tax amounts to no more than L.1,300,000 annually, proprietors of lands contribute but a small direct aid to the public income. The customs duties are levied on nearly 1700 articles imported into the country, but a few leading articles raise nineteen-twentieths of the entire amount, and the insignificant sum raised from the remainder acts merely as a prohibition on foreign commerce. The following were the duties levied on ten articles in the year ending January 5, 1840:—

1. Sugars and molasses,	L.4,826,917
2. Tea,	3,658,763
3. Spirits,	2,615,413
4. Wine,	1,849,308
5. Tobacco,	3,495,686
6. Coffee and cocoa,	794,818
7. Fruits of all kinds,	462,002
8. Timber and dye-woods,	1,668,584
9. Corn, grain, meal, and rice,	1,131,075
10. Provisions (including bacon, hams, butter, eggs, &c.),	368,560
Total amount,	L.20,871,126

On the following six articles, the duties levied in the year ending January 5, 1840, were as follows:—

1. Seeds of all kinds,	L.145,712
2. Oils of all kinds,	69,964
3. Spices of all kinds,	98,261
4. Hides and skins,	94,987
5. Tallow,	181,999
6. Wool (cotton and sheep's),	556,225
Carry forward,	L.1,147,148

Brought forward,	L.1,14
Which added to the duties levied on the ten articles in the preceding list, namely,	20,87
Gives a grand total on sixteen unmanufactured articles of	L.22,01
Balance received on 1136 minor articles,	94
Total net revenue,	L.22,96

Therefore the duty levied on all the remainin articles, including all raw materials and manufac goods, is L.55,674 less than one million. The re levied on manufactured articles was as follows:—

	Duty.	
Brass manufactures,	30 per cent.	L.
Boxes of all kinds,	20 ...	
Bugles,	1s. per lb.	
Earthenware, china, &c.,	15 to 20 per cent.	
Clocks and watches,	25 ...	
Copper, manufactures of	30 ...	
Cotton, manufactures of 10, and made up	20 ...	
Embroidery and needlework,	30 ...	
Flowers, artificial (not of silk),	25 ...	
Glass bottles, and all other sorts of glass,	30 to 120 ...	2
Hair and goat's wool, manufactures of	30 ...	
Hats of chip and straw,	20s. per dozen	
Leather gloves,	20 to 40 per cent.	1
Manufactures of leather, including shoes and boots,	30 ...	
Paper and paper-hangings, 3d. per lb., and 1s. per square yard, and hangings,		
Plaiting of chip and straw, 17s. to 20s. the lb.		1
Silk manufactures, various duties,	20 to 40 per cent.	24
Toys,	20 ...	
Cologne water, 1s. per flask, or 30s. the gallon,		
Woollen manufactures, 15 per cent. and made up 20 per cent.		2
Total duty levied,		L.40
On manufactures, except so much as is included in the L.80,760 received from the remaining enumerated tariffed and non-enumerated articles; say one-half on manufactures,		4
Total on manufactures,		L.44
Duty levied on raw materials, exclusive of cotton and wool, dye-woods, oils, tallow, seeds, hides, and skins,		50
Total duties levied on manufactures and minor raw materials,		L.94

The whole question of import duties, with refe to an improvement in the mode of levying them lately been considered by a committee of the Hou Commons: and it is likely that a very great alter will speedily be adopted, for it appears that the p bitive duties act injuriously on British manufact and induce foreigners, by way of retaliation, to ex our goods from their markets.

Expenditure.—The total annual revenue, as s mentioned, is at present between forty-four and f five millions, and we have now to see how this sum is spent. The first great item in the expend is in the form of interest on the national debt: i account rendered of the expenditure during the ending October 1840, the following statements are n —Amount applied to consolidated fund, L.31,836 amount applied as advances, and to pay off exch bills issued as advances, L.559,592; amount pa part of ways and means of year, L.12,270,118. difficult to obtain an exact idea of this compli statement; but we may be certain of the general that about L.31,000,000 are paid annually as inter

976,922, between 1815 and 1835. In 1835, the following statement was given of the number of persons employed in the chief departments of government, with amount of salaries:—

DEPARTMENTS.	No. of Persons.	Amount of Salaries.
Treasury, including Commissariat and Solicitor,	93	£36,340
Exchequer Offices,	14	7,005
Paymaster of Civil Services,	20	7,320
Privy-Council Office,	16	9,958
... ... for Trade,	29	11,231
Secretary of State—		
... Home Department,	30	13,678
... Foreign,	39	21,504
... Colonial,	31	20,457
India Board,	36	21,200
Privy-Seal Office,	1	2,000
Alien Office,	7	1,151
Register of Colonial Slaves' Office,	4	1,210
State-Paper Office,	8	1,573
Commander-in-Chief's Office,	21	7,167
Adjutant-General's Office,	22	3,070
Quartermaster-General's Office,	19	2,210
War Office, including Office for Military Boards,	84	32,042
Judge-Advocate-General's Office,	7	3,460
Army Medical Board Office,	5	2,050
Chaplain-General's Office,	2	276
Army Pay Office,	51	17,614
Ordnance Department,	996	159,120
Chelsea Hospital, including Secretary's Agents and Treasurer's Office,	157	25,599
Royal Military College,	80	...
Royal Military Asylum,	67	3,639
Admiralty and Naval Departments,	821	227,971
Customs Department, including Coast Guard,	11,602	940,763
Excise Department,	6,072	722,436
Stamps and Taxes ditto,	660	106,347
Post-Office,	1,774	124,439
Mint Office,	30	10,110
Audit Office, and other Offices transferred to that Department,	130	39,050
National Debt Office,	31	8,717
Exchequer Bill Office,	11	3,610
Woods, Forests, Land-Revenue, and Public Works Office,	60	13,445
Stationery Office,	34	5,070
Alienation Office,	7	300
Lottery Office,	...	...
Exchequer and other Departments in Scotland,	296	94,732
IRELAND.		
Chief Secretary's Office,	38	14,556
Chief Secretary's Office in London,	8	2,410
Privy-Council Office,	7	2,575
Vice-Treasurer's Office, late Irish Treasury, &c.,	13	4,964
Tellers' Office, Exchequer,	5	1,680
Privy-Seal Office,	2	100
Office of Public Works,	19	5,096
Office of Lieutenant-General Commanding,	6	1,066
Army Medical Office,	3	1,044
Quartermaster-General's Office,	6	684
Deputy Judge Advocate-General's Office,	1	597
Provost Marshal-General's Office,	1	153
Adjutant-General's Office,	9	1,018
Commissariat Department,	12	2,248
Royal Hospital, Kilmainham,	54	3,136
Board of Charitable Donations,	1	184
Board of Education,	25	4,756
	23,578	£3,193,378

The expenses incurred for the colonies were lately L.2,606,483 per annum, but this included the outlay in the military and naval departments; and the annual expenses for ambassadors and consuls in foreign countries was L.264,616, and for courts of justice nearly L.800,000. Altogether, the *civil* management of the United Kingdom costs about L.4,000,000, or but a tenth of the entire expenditure.

THE ARMY AND NAVY.

The Army.—According to the terms of the constitution, a permanent or standing army is not held to be legal. It is understood that the civil power, as exerted by magistrates, constables, and police, is competent to preserve order, and that the creation of a military force is only a matter of temporary necessity. An army, however, being constantly required both to assist the civil authority, and to protect the foreign possessions of the empire, an act of parliament, called the Mutiny Act, is passed annually, to maintain a large body of troops in regular service. Whether from this provision in the constitution or otherwise, it happens that education in military tactics is conducted on a very limited scale: the privates in the army are enlisted by small bounties from the lowest classes of the community, and very rarely, if ever, are promoted to the rank of commissioned officers. The commissioned officers, in general, belong to the aristocracy or landed gentry, and in most instances purchase their commission according to a scale of prices. Although both privates and officers are alike ill-prepared, by previous instruction, for performing the duties of their profession, such are the effects of discipline, the excellence of equipment, and other advantages, but, above all, a high tone of honour and spirit of valour, that the British army is found able to compete with forces recruited under far more favourable circumstances.

The army at present (1841) consists of the following numbers and descriptions of force:—

	Horses.	Men.	Officers and non-commissioned officers.	Expense—pay, clothing, &c.
Cavalry.				
Guards, 3 regts.	822	1,053	258	L.67,102
Line, 23 regts.	7,696	8,578	1,578	466,372
Infantry.				
Guards, 3 regts.	..	4,640	613	192,079
Line, 99 regts.	200	81,407	10,948	2,781,365
	8,718	95,678	13,397	L.3,526,918

To the account of expense mentioned above, there is to be added L.466,237 for recruiting, for depôts of regiments at Chatham, Maidstone, &c., and for other charges. There is also what is called the civil department of the army, or the army management, consisting of the salary of the secretary-at-war and his office, the commander-in-chief and his office, the medical departments, &c. By an act passed in the reign of George IV., a sum of L.60,000 is paid into the exchequer by the East India Company, on account of the charge for retiring pay and pensions, and other expenses of that nature, arising in respect of the forces serving in India. This sum is applied towards the general expenses of the state. The pay of a private in the horse guards varies from 1s. 9½d. to 2s. 0½d. per day; in the cavalry of the line, 1s. 4d.; in the foot guards, 1s. 2d.; and in the infantry of the line, 1s. 1d. When at home and in barracks, 6d. a-day is deducted from this, for which the soldier receives three quarters of a pound of meat and one pound of bread. The principal part of his clothes and accoutrements is furnished at the public expense; his pay, however, is subject to a deduction of 2s. 7¼d. a-week, in the case of privates serving in the cavalry; 1s. 1d. a-week from privates in the foot guards, and 1s. 6d. from all other privates, on account of these articles.

Besides the cavalry and foot regiments, there is another description of force called the ordnance, which includes artillery, engineers, miners, &c. They have *management of fortifications*, with their guns, stores, &c., the making of rockets, and differ of shot for great guns. There are 827 offic gentlemen cadets employed in this service, a men. These, with equipments, cost about L.1 annually.

Of the British army, 89,351 are employed and in the colonies, and 20,467 in the East In

The statements which we have made abo entirely to the effective force of the army, either on active duty or ready to be so c But, as we have already remarked under the Expenditure, there are a great number of pe tached to the army who do no duty, though r pay like others. Some of these are pension have either been long in service, or have su wounds, &c.

The Navy.—Great Britain has long been r as a first-rate naval power: by command of vessels it protects its commerce, and exerts it rity in the most remote quarters of the glob usual to say that Britain possesses the "dom the seas;" but this is only a figure of speec nation possesses no acquired or vested sovereig the ocean, acknowledged by other powers, alt times it may forcibly compel submission. Th royal navy is recruited in much the same m the army; but the constitution, by a singular sanctions the forcible abduction of men fro private homes to serve on board of war vessel species of impressment, however, is only res in cases of urgent necessity, as for instance, du heat of war. The sailors who enlist are g young men who have served an apprenticeship merchant vessels; and with this preparation, t seamen of the highest qualifications; their integrity, and kind-heartedness, are a lasting national gratulation. The following statemen an idea of the present extent of, and expenditu the royal navy:—

Wages of 34,465 sailors and marines,	- - -
Victuals for do.,	- - - - -
Dockyards for building and repairing ships, including naval stores,	- - - - - -
Wages to artificers in the establishments at home and abroad,	- - - - -
Establishments at home and abroad,	- - -
Miscellaneous,	- - - - -
Admiralty office,	- - - - - -
	-
	I

Besides the above, there is another expense in the navy accounts, such as the conveyance o half-pay to officers, pensions, &c., and which to L.1,488,221.

The average pay of a sailor is L.2, 7s. per with victuals, which are estimated at about additional. Much complaint is made of the hi ries paid to people about the dockyards; the workmen receiving L.250 per annum, and the s from 5s. to 12s. 6d. per day. During the w France, Great Britain had upwards of 100 manned by 184,000 seamen.

In 1835 there were in commission 1 first-rate decker), a ship whose war complement exce men; 3 second-rate, war complement above third-rate, war complement above 600; 8 fou war complement above 400; 6 fifth-rate, war ment above 250; 13 sixth-rate, complement bel and 136 smaller vessels. In ordinary, 14 fi 16 second-rate; 50 third-rate; 14 fourth-rate; rate; 13 sixth-rate; and 89 small vessels; in vessels. This does not include smaller vessels, yachts, cutters, transports, &c., which amoun tween 200 and 300 more. We give the list of preference to that for 1840, as the navy in th year was much greater than it is probable it tinue at. At present there are 234 of all k vessels in commission, and 43,000 sailors and employed in the naval service.

yled "Primate of England;" and the Archbishop of anterbury, who ranks next to the royal family, is yled "Primate of all England." The other dignitaries f the church are archdeacons, deans, and prebendaries; he inferior clergy are rectors, vicars, and curates. trictly, there are only three grades, bishops, priests, nd deacons, all clergymen belonging to one of these. he bishops are entitled to be addressed as "my lord," nd are legally spiritual peers. The revenues exigible y law for the support of the church are most unequally distributed, and the dioceses are of very unequal roportions. The same may be said of the working lergy, some of whom have wealthy and others very oor benefices; and some enjoy several benefices, while urates or assistants are paid on the meanest scale. The ollowing table, extracted from a parliamentary paper, hows the number of benefices or livings, parishes, hurches and chapels, with the population, in 1831:—

Diocese.	Number of Benefices.	Number of Parishes.	Churches and Chapels.	Population.
Asaph, - - - -	160	120	143	291,158
Bangor, - - - -	131	179	192	182,772
Bath and Wells, -	440	479	483	461,235
Bristol, - - - -	255	288	306	238,998
Canterbury, - - -	343	369	374	446,474
Carlisle, - - - -	128	109	129	133,982
Chester, - - - -	616	530	634	3,991,308
Chichester, - - -	276	295	303	254,460
St David, - - - -	451	525	561	349,441
Durham, - - - - -	178	149	214	460,833
Ely, - - - - - -	158	156	161	153,782
Exeter, - - - -	647	631	711	720,448
Gloucester, - - -	283	286	330	345,319
Hereford, - - - -	340	342	360	297,367
Llandaff, - - -	194	221	229	181,244
Lichfield and Coventry, - - - - -	685	656	958	1,463,681
Lincoln, - - - -	1,479	1,570	1,577	800,978
London, - - - -	577	630	682	1,722,103
Norwich, - - - -	1,076	1,178	1,228	620,139
Oxford, - - - -	280	257	257	146,700
Peterborough, - -	265	235	329	194,510
Rochester, - - -	93	107	111	191,579
Salisbury, - - -	408	451	474	391,683
Winchester, - - -	382	403	464	729,697
Worcester, - - -	222	230	260	271,697
York, - - - - -	828	741	870	1,491,533
Total, - - -	10,853	11,077	11,885	13,897,197

In 1831, on an average of the previous three years, he revenues of the archbishops and bishops amounted n the aggregate to L.160,292 per annum, and are now believed to be about L.150,000. The largest incomes were those of the Archbishop of Canterbury, L.19,182; Bishop of Durham, L.19,066; Archbishop of York, L.12,629; Bishop of London, L.13,929; Bishop of Winchester, L.11,151; and Bishop of Ely, L.11,105: the others were from about L.1500 to L.5000. The greater part of these revenues are derived from lands, or rents for grounds let on leases, and for which fines are taken on entry. The chapters of cathedrals, composed of deans, canons, and prebends, possess also large revenues, the dean of Durham, for instance, having L.4800 a-year, and other members of the chapter, L.32,160. In 1834, the gross revenues of the deans and chapters amounted to upwards of L.235,000. The revenues of the inferior or parochial clergy are derived from tithes commuted into money payments, and also fees at celebrating marriages, baptisms, and funerals. With respect to the parochial branch of church emoluments, we extract the following from Mr M'Culloch's Statistical Account, 1837:—"It appears that of 10,478 benefices, from which returns have been received, 297 are under L.50 a-year; 1629 are between L.50 and L.100 a-year; and 1602 are between L.100 and L.150; so that there are 1926 benefices under L.100 a-year, and 3528, or more than a third of all the benefices in the country, under L.150 a-year. On many of these benefices there are no glebe houses, nor do they possess the means of erecting any. Were the spiritual duties of the poorest of these livings not performed by the

clergymen of the neighbouring parishes, it is difficult to see how they could be performed at all." Curates are paid by the rectors or vicars, whose servants they are: by law their salary cannot be under L.80—the average is L.81.

The total revenues of the church may be stated in general terms as follow:—

Archbishops and bishops, - -	L.150,000
Cathedral and collegiate churches, -	250,000
Deans and other functionaries, -	60,000
10,540 parochial benefices, - -	3,100,000
Curates of resident clergy, - -	87,000
Curates of non-resident clergy, - -	337,000
	L.3,984,000

A proposal to introduce a greater equality into ecclesiastical salaries has for some time engaged the consideration of ecclesiastical commissioners; and lately an act of Parliament was passed appropriating revenues from certain sinecure offices in cathedrals, as they become vacant, to increase the incomes of the poorer class of parochial incumbents.

The appointment of the clergy to benefices is as follow:—Presented by the crown, 952; by archbishops and bishops, 1248; by deans, chapters, and ecclesiastical corporations, 2638; by universities, colleges, and hospitals, 721; by private individuals, 5096; and by municipal corporations, 53. This, says M'Culloch, is not exactly correct, there being upwards of 200 omitted in the returns.

In 1831, the total number of congregations belonging to the established church was 11,825. At the same time there were the following number of congregations of dissenters:—Roman Catholics, 416; Presbyterians, 197; Independents, 1840; Baptists, 1201, Calvinistic Methodists, 427; Wesleyan Methodists, 2818; other Methodists, 666; Quakers, 396; Home Missionary congregations, 453; total of dissenting congregations (exclusive of Jews), 8414. It is considered probable that this number includes as many actual worshippers as the 11,825 congregations of the establishment, or about 4,000,000. Thus, reckoning dissenters and members of the established church at 8,000,000, about 6,000,000 remain who cannot be said distinctly to attend any place of public worship, though in most instances nominally belonging to the established church.

Church of Ireland.—In Ireland, the established religion is the Protestant Episcopacy, of which another branch is established in England. Thus the same doctrines, ritual, and forms of ecclesiastical government, exist in these two countries, the hierarchies only being different with respect to their political status. At present, considerable alterations are in the course of being carried into effect with regard to the higher orders of the Irish clergy and their dioceses. Hitherto there have been four archbishoprics—Armagh, Dublin, Cashel, and Tuam, with thirty-two dioceses consolidated under eighteen bishops. When the new arrangement is carried fully into effect, by the demise of certain functionaries, there will be only two archbishops, those of Armagh and Dublin, and ten bishops. The Archbishop of Armagh is styled "Primate and Metropolitan of all Ireland;" and the Archbishop of Dublin is styled "Primate and Metropolitan of Ireland." There have hitherto been 33 deans and 30 chapters of cathedrals. The number of parishes, including perpetual curacies, is (or was lately) 2405, but many have no church, and the number of incumbents for the whole is 1385. According to the proposed arrangements, the money saved by the extinction of higher offices is to be appropriated to sustain churches and glebe-houses in parishes, and to execute other necessary purposes.

The revenues of the archbishops and bishops, in 1831, amounted to L.151,128 annually; and the total income of the church, including value of glebe-lands and tithes, was L.865,535. (*Parliamentary paper.*) The tithes of most parishes have since been compounded M'Culloch estimates the amount of composi- all the parishes at L.704,313, 15s.

The Roman Catholic church in Ireland co four archbishoprics and twenty-three bishop parochial divisions and a body of clergy simila plan of the establishment; to it also belongs a c able number of monasteries. After the Roman body, the chief dissenting communion is the Presbyterians, in the northern parts of the The following table, drawn up by properly a commissioners, shows the state of religious pa Ireland in 1834:—

PROVINCES	Members Estab. Church.	Roman Catholics.	Presby-terians.	Other Protest. Dissent.
Armagh, -	817,722	1,855,123	626,073	15,883
Dublin, -	177,930	1,053,681	2,217	3,162
Cashel, -	111,813	2,230,340	268	2,454
Tuam, -	44,588	1,188,588	809	289
Total,	852,054	6,427,712	642,366	21,883

According to law, two days throughout the y clusive of Sundays, are set apart as holidays, c from labour, in England and Ireland, namely mas and Good Friday.

Church of Scotland.—Protestant Presbyte according to a polity introduced from Geneva l was established in Scotland, by act of Parlia 1560, a few years after the previous Roman church had been completely dismembered a pressed. The history of the country dese struggles of this form of church government w copacy during the greater part of the sev century. Shortly after the revolution, an act o ment of William and Mary, in 1690, re-est Presbytery on the model of a statute of 15 cording to the plan thus established, and nev wards materially altered, the clergy of the C Scotland are all equal in rank, and are officia sters of parishes. To the church belongs a lay functionaries called elders, each church several, who assist the clergyman at the com visit the sick, and generally act as a vigilant e tical police. This incorporation of laity with th has given it a remarkably secure footing in t tions of the people. The ecclesiastical comm governed by a series of courts—the lowest b kirk-session in every parish, composed of the and elders; the next is a court composed of th of a division, called a presbytery, and an el each parish; the next is a synodal court, com functionaries from an aggregation of presbyter the highest is the General Assembly, composed gates from the presbyteries, and which meets at Edinburgh. Constant residence in their pa obligatory on the clergy.

A few years ago, before recent alterations of legality, there were in Scotland 80 presbyteri parishes, and 1050 ministers, some churches two clergymen. The church has lately includ sters of chapels of ease in its judicatories; and i ultimately sanctioned as lawful, the above nu clergymen will be considerably increased. Ne entire body of clergy (ministers of chapels of *quoad sacra* parishes, not included) are appo lay patrons, or by the crown, in virtue of a Parliament in 1711–12, reviving ancient righ General Assembly, in 1834, passed an act, called the *Veto Act*, giving male communicants, families, the right of objecting to the appointm patrons; but this has been declared illegal by courts, as interfering with the private pro patrons (the advowsons being saleable), and t tion remains in a doubtful and precarious state (1841).

The parochial clergy are supported by money levied from the heritors or landowners, on the of commuted tithes or teinds. The amount of yearly, depends on the average market value the averages being called *fiars*, which are struck

ry in every county. Each minister being entitled
rtain quantity of grain, the value of the quantity,
ing to the fiars, is paid in money. If the tends
lands of the heritors be not all uplifted, the
is liable to be increased at the end of every
years. In 1836, the gross amount of teinds
the clergy annually was L.146,942, and the
s left unappropriated in the hands of private
ds was L.136,186. It is not stated by any
rity we have consulted, what unappropriated
are in the hands of the crown; but it appears
here are bishops' teinds (formerly revenues of
s), amounting to L.16,741 annually, of which a
is drawn by the crown, and L.10,182 unappro-
d. The total income of the church, including
e glebes and manses, is calculated at L.274,620,
an average of L.256 each. In some parishes,
legible stipend is so small, that it is made up to a
m of L.150 by government. Among the largest
es are those paid to the eighteen parish ministers
nburgh, who receive about L.500 each, levied by
ular law as a money-tax from the inhabitants.
xpenses incurred for building and maintaining the
s of the churches and manses, is defrayed by the
es along with the stipends.

Scotland, no secular days, such as Christmas and
Friday, are legally set apart as holidays, the
sh church recognising no saint's days or holidays
ever. But in each parish there are one or two
ys in the year, previous to the celebration of the
munion.

land abounds in dissenters, the bulk of whom
ly separatists from the church, and, under va-
names, possess the same doctrines and formula.
e these dissenters, there is a considerable body
rotestant Episcopalians, in communion with the
h of England; also Roman Catholics and Inde-
nts. The number of congregations belonging to
Established Church, and various dissenting bodies,
be summed up as follows:—Established Church,
; United Associate Synod, or Secession Church,
other Presbyterians, 350; Independents, 100;
opalians, 60; other Protestant sects, 40; Roman
ics, 60; total, 1630.

EDUCATION.

gland.—England is almost the only country in
e in which there is no public or general system
mentary education. For the instruction of her
y and gentry, she has several great public classi-
hools, among which are those of Winchester,
minster, and Eton, and also two great univer-
Oxford and Cambridge; but she has no national
lishment, like those which exist in Prussia, Hol-
and other countries. Elementary instruction is
to the children of the poorer classes by endowed
charity schools, and the children of the middle
s are chiefly educated at schools of private
re.* In 1818, there were in England 4167 en-
d schools, 14,262 unendowed schools, and 5162
ay schools, educating 644,000, or one-sixteenth of
hire population, instead of the sixth, which Prussia
hown to be the proper amount of school-attenders.
England was shown to enjoy little more than a
part of the proper amount of education, even sup-
g the education she did enjoy to be good. Of the
0 parishes, 3500 were, in 1820, without a school.
tween 1818 and 1833, considerable advances were
in the establishment of infant and ordinary day
ls; and in the last-mentioned year, the statement
of schools throughout England and Wales, according to a parliamentary paper, was as follows:—

	Schools.	Scholars.
Infant schools,	3,242	69,686
Daily schools,	23,769	1,207,261
Total,	27,011	1,276,947
Maintenance of infant and daily schools:—		
By endowment,	4,108	133,764
By subscription,	8,859	478,537
By payments from scholars,	12,141	622,449
By subscription and payment from scholars,	2,835	212,217
Sunday schools,	45,826	1,543,826
Maintenance of Sunday schools:—		
By endowment,	371	20,532
By subscription,	13,244	1,429,277
By payments from scholars,	101	5,718
By subscription and payment from scholars,	913	80,201
Schools established by Dissenters:—		
Infant and daily schools,	923	51,963
Sunday schools,	6,247	734,697
Increase of schools between 1818 and 1833:—		
Infant and daily schools,	10,643	671,263
Sunday schools,	11,293	1,125,307
Schools to which lending libraries are attached,	2,465	

In 1833, when this statement was compiled, the population of England and Wales was estimated at 15,000,000; the total number of scholars, therefore, as above enumerated at 1,276,947, gives the ratio of about 1 in 15 of the population at school. Since 1833, additional schools have been opened, particularly in connexion with factories, mechanics' institutions, and by subscription. At present, a considerable proportion of the humbler order of schools are in connexion with two great rival societies—the British and Foreign, and the National, both of whose head establishments are in London. Recently, an annual grant of L.30,000 has been made by Parliament, to enable the privy-council to encourage elementary instruction in such schools as will submit to the supervision of an inspector. Religious sectarian differences have as yet frustrated every other step towards the establishment of a national system of education.

Ireland.—The chief educational establishment in Ireland is Trinity College in Dublin; and latterly a collegiate institution for conferring the higher branches of instruction has been established in Belfast. Elementary education has in recent times made great advances in this part of the United Kingdom. In 1831, there was established by act of Parliament a national system of education, the main feature of which is an arrangement by which the children are separated at certain times, and taught religion by their respective pastors—the necessary funds being provided by the state. By this means it was hoped that the great body of the people, and more particularly the children of the poorer class of Catholics, would at length be brought within the pale of education. We need not say how differently the plan has been regarded by various parties, both in Ireland and in Britain. The national board consists of nine commissioners chosen from both the Roman Catholic and Protestant bodies—the Roman Catholic and Protestant archbishops of Dublin being among the number. The commissioners receive from the public purse, and expend annually, the sum of L.50,000; their estimate for the year ending March 31, 1840, was L.50,357, which they proposed to lay out as follows:—On training of teachers, L.2220; model schools, L.390; grants towards building and establishing new schools, L.12,000; salaries and gratuities to teachers, L.23,000; infant schools, L.220; agricultural schools, L.150; inspection, L.4975; books and school requisites, L.4250; and general expenditure, L.3152. The fee paid by each scholar is 1d. per week. In March 1838, the number of national schools was 1384, attended by 169,548 children; but 193 new schools were soon to be opened, and it was expected that they would be attended by 40,106 pupils, making a total of 209,654. Reckoning, however, the schools said to be in actual operation in March 1838, there were then upwards of 159,000 children receiving

is believed that, at this moment, the incomes of the estates
rest property left for educational purposes, would amount,
erly managed, to L.400,000 a-year.—*M'Culloch*, 1841. It
e added, that, besides the misappropriation of this sum,
of that which is actually expended on the antiquated
ses of the grammar schools is little better than thrown
The abuse of educational endowments in England is a
national evil, requiring speedy correction.

a regular elementary education, at an annual cost to the state of L.50,000.

Besides this great national system of elementary instruction, the country possesses several religious or charitable associations for promoting education among the poorer classes: of these the principal are the Kildare Place Society, which lately supported 1097 schools, attended by 81,178 scholars, and the Church Education Society. The Roman Catholic body also supports a considerable number of schools.

Scotland possesses five colleges or universities for the higher branches of instruction, being those of Glasgow, St Andrews, King's College and Mareschal College Aberdeen, and Edinburgh. Education at these institutions is generally conferred on a more liberal and less expensive scale than at the universities of England. Scotland has been long distinguished for its parochial institutions for elementary instruction, and also for its grammar-schools or academies in the chief towns, which serve as preparatory gymnasia for the universities. Each parish (some parishes in towns excepted) is provided with a school at the expense of certain landowners or heritors, in virtue of an act of Parliament passed in 1696, re-establishing statutes formerly in existence. Another act was passed (43 Geo. III. c. 54) in 1803, amending existing provisions on the subject, and ordaining "that the salary of each parochial schoolmaster shall not be under L.16, 13s. 4d., nor above L.22, 4s. 5½d.," except in particular cases mentioned; and provision is further made for augmenting this minimum and maximum at the end of every twenty-five years. An increase accordingly took place in 1828, raising the minimum to L.25, 13s. 3⅓d., and the maximum to L.34, 4s. 4½d. These payments are made according to the liberality of the heritors; and they besides must provide a small house for the schoolmaster, with a garden, as well as school-house. The teacher is entitled to take small fees in addition; the more common fee is 2s. or 2s. 3d. per quarter for instruction in reading, with 6d. for writing. Altogether, this class of men are slenderly remunerated for their extremely valuable services. Within the last thirty years, the parish schools have been almost superseded in some quarters by the establishment of voluntarily supported institutions, better suited to the wants of the age.

In a report to Parliament in 1834, the number of schools in Scotland was stated as follows:—Parochial schools, 1047; pupils attending them, 68,293; total emoluments of teachers, L.55,339. Voluntarily supported schools, 3995; pupils attending them, 154,160. It appears from this that there were 222,453 children receiving instruction (not including the attendance at Sunday schools), and that of these only 68,293, or little more than one-fourth, were educated at the parochial schools. There were 5042 schools, and of these only 1047, or about one-fifth, were parochial establishments. The publication of this report caused considerable surprise, for it was generally believed that the great bulk of the juvenile population were instructed in the parish schools. The total emoluments of the parish teachers are stated at L.53,339, or on an average, L.45, 11s. 9¼d. each; but of this sum only L.29,642 is stated as salary, there being collected in school fees, L.20,717, and from other sources, L.4975. The average annual expense of educating each child at the parochial schools, on the above data, appears to be 15s. 7¼d. A great difference was found between the attendance of males and females. Taking the entire attendance on schools, there were 132,489 males, and 89,964 females. The result of the inquiry seems to be, that about 1 in 9 of the population in Scotland attends school.

The generally imperfect instruction among the humbler orders of society in all parts of the United Kingdom is strikingly manifested in the returns of criminal commitments. On this interesting topic we ex-

—*t the following* results of an inquiry instituted with
'o education and crime, and lately embodied in
't read before the Statistical Society of Lon-
wson W. Rawson, Esq.

"1st, That only 10 in 100 of the criminal cl committed for trial in E land and Wales are read and write well, and of these only 4 in 10 received such an amount of instruction as may titled to the name of education; and that the portions are greatly below the average stand instruction among the general population.

2d, That these proportions are considerably in Scotland, and lower in Ireland; and the e appears to establish that the degree of instructi sessed by criminal offenders is an indication of th sessed by the general population in the same di

3d, That about one-third of the adult male tion of England cannot sign their own names, a from one-fifth to one-fourth can neither rea write.

4th, That these proportions are much more able than in France or Belgium, where one-hal youths at the age of eighteen could neither re write. The proportion of wholly ignorant crimi those countries is correspondingly greater than i land.

5th, That in England, instruction is twice as lent among male as among female criminals, a half more prevalent among males in the genera lation than among females. That in Scotlan Ireland it is three times as prevalent among th criminals.

6th, That this unfavourable condition of fem these two countries is further confirmed by th that the proportion of female to male crimi greater than in England; and it may be traced circumstance of the number of girls at school i two countries being very small in comparison w number at school in England. In comparing th countries, the number of female criminals is fo be exactly in the inverse ratio to the proport females at school.

7th, That education has a greater influence females than among males in restraining them fr commission of crime.

8th, That instruction prevails, upon an averag greater extent among the agricultural than amo manufacturing counties of England; but that th cultural counties in the east, east-midland, and east, are greatly below the average."

DISPENSATION OF LAWS.

Justice, civil and criminal, is administered in land and Ireland according to laws and forms took their rise in the former country, and were i extended to the latter. The English law, as it i prehensively termed, is of two kinds—written or law, consisting of the laws established by acts o liament, and consuetudinary law, consisting of c which have existed from time immemorial, and received the sanction of the judges. Consuetu law is again divided into common law and equit former is administered by courts which profess here strictly to the old laws of England, except far as they are altered by statute; the latter was fo upon the principle that the king, in cases of ha was entitled to give relief from the strictness common law. Equity, though thus originated, ha become also a fixed kind of law, and is administe courts which decide according to established rul

The principal court for civil suits is the Co Common Pleas. The Court of King's (or Qu Bench, which was at first only a criminal tribun the Court of Exchequer, which was designed o decide in cases concerning the revenue, have b civil courts by means of fictions in their resp modes of procedure. The Court of Chancery, pr over by the Lord Chancellor, administers the equity. Courts under these designations sit b Westminister and in Dublin: there are also cou assize, which, in England, perform six provincia cuits, in some instances once, and in others twice a Minor cases, criminal as well as civil, are [illegible]

...e of provincial magistracy, who meet in every ...y once every quarter of a year. Besides the civil ...riminal tribunals, there are ecclesiastical courts, ...h have jurisdiction in matters connected with mar..., wills, &c., and adopt the principles of the old ...n law. There are also courts of admiralty, which ...e questions between persons of different nations, ...ding to the code of civil law recognised through...Europe.

...ernsey, Jersey, Alderney, and other small islands ...e British Channel, which politically belong to the ...ed Kingdom, possess a variety of peculiar privileges ...egal usages. The Isle of Man, situated in the sea ...een England and Ireland, likewise possesses certain ...lar privileges.

...Scotland, laws peculiar to itself, founded upon the ...ciples of the Roman and the Feudal law, are admi...ed by a supreme civil tribunal, denominated the ...t of Session, which remains fixed at Edinburgh, ...by a criminal tribunal, named the Court of Justi..., which not only sits in the same city, but makes ...its through the provinces. Minor civil and crimi...cases are also judged in Scotland by the sheriffs ...e various counties, and the magistrates of the ...ughs.

...nd possesses the advantage of public prosecu...of offences, the injured party being only a wit...ss to the public prosecutor. The chief public ...cutor is the Lord Advocate; the inferior public ...cutors, in connexion with the various minor courts, ...rmed procurators-fiscal. The whole expense of ...ution is defrayed by the national exchequer.

...e peculiar boast of the criminal law of the British ...s, is the *Jury*. In England and Ireland, where ...principle of the criminal law requires the injured ...y or his representative to prosecute, he can only ...by permission of a jury of accusation, called the ...d Jury; another jury sits for the purpose of de...ing if the evidence against the accused has established ...guilt. These juries consist in England and Ireland ...welve men, whose verdict must be unanimous; in ...land, the jury upon the charge consists of fifteen ..., who decide by a plurality of votes. The jury is ...institution of Scandinavian origin, transmitted to ...ain through the Saxons, and it is justly considered ...most efficient protection of the subject from the ...ceiveness of power. Civil cases, turning upon ...ers of fact, are also decided in all parts of the ...ed Kingdom by juries.

...e Houses of Lords, as the great council of the sove..., serves as a court of last appeal from the civil tribu...of Britain and Ireland. Practically, the business ...earing these appeals is undertaken by some law lord, ...as the Lord Chancellor, who, as there must be ...e persons present, is usually accompanied by a ...peral peer and a bishop. Before deciding, the ...se sometimes demands the opinions of the English ...es.

...e laws and judicial usages of England and Ireland, ...afterwards explained, are extended to most of the colo...possessions, along with all the rights and privileges ...ch are common to British subjects. Hence, the ...abitants of the most distant part of the empire, what...r be their origin, rank, or colour, are entitled by the ...stitution to enjoy the same degree of civil and reli...s liberty, and the same careful protection of life ...property, as their fellow-subjects in the mother ...ntry. This is an invaluable boon, for in no nation ...the people practically enjoy greater liberty of speech ...action (without licentiousness), and in none is the ...e more unshackled. Next in point of value to the ...ilege of trial by jury, the British subject places the ...t of *petition* to the Houses of Parliament, either for ...improvement in the laws or a redress of grievances. ...this involves the right of assembling publicly in a ...eful manner, or of *meeting constitutionally*, to dis...measures of government and legislation, it is ...ved to form the *impregnable bulwark of British ...tical freedom*.

COLONIAL POSSESSIONS.

The foreign possessions of the United Kingdom are infinitely more extensive and populous than the home country. They are about thirty in number, reckoning all classes of foreign stations and possessions, and lie in every quarter of the globe. The oldest existing colonies are the West Indies, chiefly consisting of a series of islands stretching across the great bay which nearly divides North from South America. Britain is mistress of Canada, New Brunswick, and Nova Scotia, on the mainland of North America, with Cape Breton, Prince Edward Island, and Newfoundland, on the coast. On the mainland of South America she possesses British Guiana. In the southern ocean she has appropriated the vast continent of Australia, containing the colonies of New South Wales and South and West Australia, also near its coast the island of Van Diemen's Land. In an easterly direction from these she possesses the New Zealand Islands; and near Cape Horn she possesses the Falkland Islands. In Asia she occupies a large part of Hindostan, and near its shores the large and beautiful island of Ceylon. In the Indian Ocean she possesses the Mauritius, and in the Atlantic the islands of Bermuda, Ascension, and St Helena. On the continent of Africa, the principal British colony is the Cape of Good Hope, which is at present among the most thriving of our foreign possessions, and is the only spot in Africa in which civilisation has been successfully planted. On the western coast of Africa lie the British colonies and military and naval stations of Sierra Leone, Gambia, and Fernando Po. In the Mediterranean, Britain has under her protection the Ionian Islands, and possesses Malta, and Gibraltar, the latter being merely a military post at the southern extremity of Spain. In the German Ocean also holds the small island of Heligoland.

In all the colonial possessions, the religion and law of England are established, except where a provision, in terms of conquest, has been made to the contrary. All are free crown colonies, except Hindostan, which is subordinately governed by the East India Company, by whom it was conquered with the aid of British troops. With the religion and law of England have been generally introduced the English language, usages, and manners. The colonies possess little or no independent power. They are locally managed by governors and other functionaries appointed by the crown, and are subject to numerous regulations imposed by the imperial Parliament or by the colonial secretary. Canada, Nova Scotia, New Brunswick, Newfoundland, and the Cape of Good Hope, individually possess local legislatures, or parliaments, by which various internal concerns, such as making roads, education, imposition of dues on shipping, &c., to defray expenses, are managed. The colonies are not taxed to support the home government, it being a principle in the constitution that there can be no taxation without representation; but they are subjected to various customhouse duties and restrictions, that greatly limit their capacity for improvement. All the raw produce they can export, such as sugar, coffee, timber, &c., is permitted to enter British ports at a duty much lower than the same kind of produce from foreign countries. This preference is in one respect advantageous; however, they are at the same time restricted in the purchase of various articles, except from Britain and its possessions. They are also prevented from manufacturing certain kinds of produce; for example, the inhabitants of Jamaica cannot refine their own sugar, but are compelled to send that article to England to be refined, and then buy it back again. By these arrangements, the colonies are, generally speaking, in a state of tutelage, and cannot, without a very great change in their affairs, start forward in a course of prosperity; while we at home, by being compelled to pay for their protection, and to buy their high-priced produce, receive no adequate benefit from their possession. The ostensible object of maintaining a connexion with the colonies, is to find

an outlet for British manufactures, and to employ shipping in the transport of goods. It is, however, extremely doubtful whether the expense incurred in supporting them is not much greater than all the profit derived from commercial intercourse. In a return to Parliament lately published, the following statement of the expenditure of the United Kingdom on the colonies, was given for the year ending March 1, 1836:—

Military charges, net,	L.2,030,089
Civil charges, net,	486,154
Naval expenditure,	39,364
St Helena (not classified),	90,833
	L.2,646,410
Deduct repayments out of colonial revenues, &c.,	39,928
	L.2,606,482

The expenditure for each colony, neglecting fractional parts of a pound, is as follows:—

MILITARY AND MARITIME STATIONS.

	Total Expenditure incurred by Great Britain.
Gibraltar,	L.139,830
Malta,	110,818
Cape of Good Hope,	242,907
Mauritius,	76,284
Bermuda,	91,446
Fernando Po,	510
Ascension,	4,907
Heligoland,	1,016
Ionian Islands,	118,985
St Helena,	87,558

PENAL SETTLEMENTS.

New South Wales, Van Diemen's Land,	533,501
General charges,	23,449
	L.2,606,483

The total value of exports to the above dependencies in 1838 (see statement of exports in another page), was about ten millions, the profit on which would be 10 per cent.; but the above sum incurred for protection is equal to 25 per cent. on the ten millions, and therefore there is a clear loss of 15 per cent. on colonial commerce. We have not seen any statement of what benefit is derived by British shipping from the colonial connexion; but whatever it is, there can be no doubt that the same number of ships would be employed in the export and import trade, if the colonial connexion was disevered. It appears to us, that the only real advantage derived by Britain from her colonies, is the ready means afforded for sending large masses of her population as emigrants to these vast and fertile territories, where their settlements become the nurseries of future independent and civilised nations. In this respect, the colonial system of Britain is of immense importance to the cause of Christianity and civilisation; and it is only matter of deep regret that, by proper management and the abolition of all restrictions, the colonies are not rendered more valuable and less expensive to the mother country. Reckoning the expense of military, naval, and civil protection, along with the heavy loss incurred by our obligation to buy their dear produce, it is calculated that in ordinary times the people of Great Britain lose between five and six millions annually by the colonies.

India is not, strictly speaking, a colony or possession of Britain. Politically it belongs to the Honourable East India Company, an association of British mer- . by whose servants it has been conquered, and locally governed, under the control and ap- however, of the crown, and a charter granted ilature. In virtue of an act of Parliament passed in 1833, the East India Company ranteed the government of the British territo India until April 1854; the company is not to on any trade; commerce to be open to British chants; natural-born subjects of England may to, settle, and buy lands in India; and natives o of whatever colour or religion, are to be eligible t India affords no direct revenue or tribute t land, as conquered countries are in general s to do. The only advantages which we derive fr occupation of these immense countries, are the puted possession of their trade, and the fortunes times very large) saved out of their salaries by subjects who are appointed to discharge the d government. It is to the trade of the country ever, that we must look for any considerable a manent advantage; and as this can only be i increase by the cultivation of peace and order t the country, the interest of Britain becomes involved in maintaining henceforth the peace of The improvement which a few years of peace ef these fertile countries, is astonishing: the popula a certain portion is supposed to have nearly dou the period of comparative peace from 1811 t being in the former year only forty-five, and latter almost ninety, millions. Till she came British rule, India never enjoyed twenty years o and orderly government in all her former Many faults and oppressions are laid to the of the English in India, from which it is imp to defend them. The taxes (which fall chief the *land* and the poor peasantry) are very opp and are rendered more so by the unprincipled e of the natives who are employed to collect them. tice also is administered in a foreign language (P and the courts are so few, that districts which are than Scotland have hardly one to each. Notwith ing all this, the preservation of public order peace has conferred advantages on the country most inestimable kind. Latterly, considerable im ments have been effected by the establishment of s and by Christian missionaries of various persua

The territorial extent of the British possess India is 514,190 square miles; the population, as it has been ascertained, 89,577,206; to whi be added eleven millions more for districts not in in the census. There are several states whi under British *protection*, though not directly go by our establishments; these have an area of 6 square miles, and a population estimated at for lions. The goods exported from Britain in the East Indies, including Ceylon, were val L.3,876,196. As India, by the taxes which it the Company, clears the cost of its own protectio all its other public expenses, it may be conside the only foreign possession of Britain whose affords an unburdened profit to the home co The forces employed by the Company, partly co of British regular troops, and partly of native amounted in 1830 to 224,444 men. In 1833 annual revenue was L.13,680,165, an enormous be raised in a semi-barbarous country, yet no than sufficient to discharge the annual expenses. Company at that time was in debt to the amo L.35,463,483. (See article EAST INDIES.)

MANUFACTURING AND COMMERCIAL INDUSTRY.

Manufactures.—The manufactures of Great B surpass in extent and variety those of any other try; and from the superior character of its mach the economising of time, and the refined skill workmen, the manufactures are generally produ a lower rate, and of better quality, than in co more favourably situated with respect to the p tion of raw materials.

The Cotton Manufacture is the most extensive whole, both with respect to the capital which it in and the number of people to whom it gives employ it is supposed to form one-fourth part of the to

y of Britain. The number of work-people in its ... (including spinners, weavers, ..., &c.; engineers, smiths, and others engaged ... works) is estimated at 1,500,000. The capital ... in this large branch of manufacture at present ... at about L.50,000,000, and the total value ... goods annually produced is believed to be be... L.30,000,000 and L.34,000,000. The raw ma..., or cotton wool, is brought chiefly from America, ... part also from the East Indies and Egypt. The ... seats of the manufacture are Manchester, Glas... and Paisley; and the magnificent apparatus of ..., machinery, and warehouses, with which these ... are filled, for this sole business, are the astonish... of all visitors. According to papers published a ... ago by the Board of Trade, there were in the ... at large 1262 cotton factories at work, and 42 ..., since the period of which estimate many more ... been erected. It has been calculated that there ... least 10,000,000 of spindles and 100,000 power... in the United Kingdom. The cotton manufacture ... formerly been greatly impeded in its tendency to in... by the establishment of cotton factories in Ger..., Switzerland, and the United States, in the two ... of which countries labour or food is cheaper than ...tain, and consequently goods are there produced ... somewhat cheaper rate.

The Woollen Manufacture.—This manufacture was ... earliest established in England; it gives employ... to above half a million of people, who receive on ...verage, men, women, and children, about L.15 per ... The goods manufactured are valued at twenty ... millions; the finer qualities of the raw material are ...orted from Germany, or from our colonies in Aus...; the coarser are produced at home: the value ...e whole is estimated at L.6,000,000. This manu...re, particularly the finer kinds, is chiefly carried ...n the north of England; some of the coarse ...ics, such as plaidings, duffles, &c., are made at ...bleis in Scotland; and Kilmarnock and Stirling ...e a thriving trade in carpets, blankets, &c. In the ...st kind of linendoths, the Prussians are said to ...l the English.

The Silk Manufacture has been carried on in this ...ntry for a long period, having been first introduced ...e fifteenth century by emigrants from France. It ... for many years confined chiefly to Spitalfields in ...don, and to Coventry. There were then prohibitory ...s on all foreign silks, but this, instead of fostering ... manufacture, as was intended, only encouraged its ...gglers in incidence, as they knew that they had the ...e market to themselves. These prohibitions have ...e partly removed since 1824; and those regulations ...ch confined the manufacture to some particular ..., are also done away with; so that the trade has ...e roused from its inactivity, and a great deal more ...siness is done than formerly. The quantity of silk ... working imported in 1823 (the year before removing ... restrictions) was two and a half millions of lbs.; ... average quantity of the same material imported ...ce, has been three and a half millions. The con...ption of silk goods at home has increased more than ...old. The annual produce of the manufacture is now ...mated at L.10,000,000; and it is supposed to give ...loyment to about 300,000 work-people. Its chief ...ts are Spitalfields in London, Coventry, and latterly ...chester, Paisley, and Glasgow, where some of the ...st beautiful fabrics are now made.

The Leather Manufacture is of considerable import...e. The value of the different articles of which it forms ... material, is estimated at L.15,000,000; this includes ...es, saddlery, boots and shoes, &c. The increase of ... trade in late years has been very great; *hides* are ...orted from all quarters of the world, and the quantity ... doubled within a few years. The number of lamb ...kid skins imported, in 1830, was about three millions.

Iron, Cutlery, and Hardware.—This is one of the ...nufactures in which Britain particularly excels. The ...ndance of her mines of iron, copper, tin, lead, and ...coal, and the easy access which can be had to them at all points by sea, river, or canal, give facilities which are possessed by no other country. The annual value of the manufactured goods is estimated to be above L.17,000,000, and employment is given to 320,000 men in the working of copper, brass, pewter, steel, tin, and other metals. The chief seat of the manufacture of the finer and more skilled articles, is Birmingham, Sheffield, and the immediate vicinity; and from these districts metal goods of all descriptions, implements of war, and the most elegant ornaments of peace, are dispatched to all parts of the world. For heavy cast-iron goods, cannon, parts of machinery, &c., Carron, in Scotland, has been long celebrated.

The Earthenware, China, and Glass Manufactures, rank next to those we have mentioned. The number of people employed cannot be easily estimated; but as no money has to be sent abroad to purchase any part of the material of these works, the whole proceeds of the goods go to pay wages at home. The annual value of the glass manufactured is about two and a half millions, and that of the pottery and earthenware about three and a half. It is believed that the trade in glass might be doubled, if relieved of the burdensome excise duties and regulations which prevent improvement.

The whole value of the manufactures of all kinds produced annually in Great Britain, is reckoned to be about L.150,000,000.

Commerce.—Since the middle of the last century, the rapid progress of improvement in manufactures has continued to afford new materials and goods for exportation, and the increase of trade has been in proportion. Since 1800, the import and export trade have prodigiously increased. The late and present extent of the import and export trade of the United Kingdom is as follows:—In the year ending January 5, 1840, the official value of imports was L.62,004,000; official value of exports of British produce and manufactures, L.97,402,726; official value of exports of foreign and colonial merchandise, L.12,795,990; total exports, L.110,198,716.

Quantities of the Principal Articles of Foreign and Colonial Merchandise entered for Home Consumption, in the Years ending January 5, 1839 and 1840.

Declared Value of British and Irish Produce and Manufactures Exported from the United Kingdom to different Countries in 1838.

British Possessions.—East India Company's territories and Ceylon, L.3,876,196; British West Indies, L.3,393,441; British America, L.1,992,457; Australia, L.1,336,662; Gibraltar, L.894,696; Cape of Good Hope, L.623,323; Mauritius, L.467,342; Channel Islands and Man, L.343,854; West Coast of Africa, L.413,354; Malta, L.226,040; St Helena, &c., L.15,065; total, L.13,581,830.

Foreign States.—Russia, L.1,653,243; Sweden, L.102,647; Norway, L.77,485; Denmark, L.181,404; Prussia, L.155,223; Germany, L.4,988,900; Holland, L.3,549,429; Belgium, L.1,068,010; France, L.2,314,141; Portugal, L.1,165,395; Azores, L.31,385; Madeira, L.34,947; Spain, L.243,839; Canaries, L.47,623; Italy and Italian Islands, L.3,076,231; Ionian Islands, L.96,100; Turkey and Greece, L.1,787,997; Syria, L.188,440; Egypt, L.342,505; Barbary, L.74,013; East Coast of Africa, L.10,765; Cape Verd Islands, L.1302; Arabia, L.167; China, L.1,204,356; Sumatra and Java, L.505,362; Philippine Islands, L.31,780; New Zealand, &c., L.1095; Hayti, L.290,139; other Foreign West Indies, L.1,025,392; United States, L.7,585,760; Mexico, L.430,776; Columbia, L.174,338; Brazil, L.2,606,684; States of La Plata, L.690,345; Chili, L.413,647; Peru, L.412,195; total, L.36,479,140.

In all, L.50,060,970; of which Europe, L.21,171,504; Africa, L.1,847,750; Asia, L.6,689,856; Australasia, L.1,337,737; North America, L.9,578,217; West Indies, L.4,708,972; Mexico and South America, L.4,726,905.

It will be observed from these statements, that the best customer of Great Britain is the United States of North America, the trade with which has prodigiously increased since the colonial connexion was dissolved. The exports to Brazil are likewise considerable, being at present about L.4,000,000. There is reason, however, to fear that both these countries contemplate the exclusion of British goods, in consequence of our high prohibitory duties on their produce. For a further notice of British manufactures and commerce, we refer to the article COMMERCE, and also to the articles on the various branches of manufactures.

SHIPPING.

The following statements embrace a view of the number of ships belonging to and engaged in the commerce of the British empire:—

Account of the Registered Shipping belonging to the empire on the 31st of December 1839, and Ships built during the previous Year.

	Ships Registered.		Ships Built.
	1839.		1838.
	Tons.	Men.	Ships.	Tons.
England,	1,983,522	114,293	951	144,300
Scotland,	379,194	25,909	217	32,717
Ireland,	169,289	11,288	69	4,084

Account of Shipping employed in the Coasting Trade in the Year ended January 5, 1840, stated exclusively of Ships in Ballast.

	Entered Inwards.		Cleared Outwards.	
	1839.		1839.	
	Ships.	Tons.	Ships.	Tons.
Employed in intercourse between Britain & Ireland,	9221	1,176,893	17,375	1,768,34
Other Coasting Ships,	121,033	9,433,511	125,560	9,537,83
Totals,	130,254	10,610,404	142,935	11,306,17

The following is the list of steam-vessels belonging to the British empire in 1836:—

	Vessels.	Tonnage
England,	338	39,314
Scotland,	93	11,523
Ireland,	71	13,469
Guernsey, Jersey, and Man,	7	914
British plantations,	39	7,893
Total,	549	67,923

This is very nearly double since 1829. Now (1841) the list might be vastly increased by the addition of the Atlantic steamers, and others of great power.

None of the above accounts include the great number of canal or fishing-boats with which many parts of the coast are swarming.

PUBLIC WORKS, CANALS, RAILROADS, DOCKS, &c.

Connected with our manufactures, are the great works of the civil-engineer—canals, roads, docks, bridges, piers, &c.—works which attest, more obviously than any others, the activity, power, and resources of the country. It is to the facility of internal communication afforded by these works, that the heaviest goods, though manufactured in the interior of the country, can be carried to sea-ports for exportation, without any burdensome addition to their price; and materials for their different manufactures can be carried to inland towns from sea-ports, by canals or railroads, with the same advantage.

The length of the *Turnpike Roads* in 1829 (the latest authentic account), was 24,541 miles; annual income L.1,214,716; debt, L.3,200,000. The income, of course, was from tolls, and was intended for repairing the roads and paying the interest of the money borrowed for constructing them. The total length of the canals, in the

year, was [illegible] miles; the income on these canals ...ted to L.13,205,116, which, besides keeping them ...ir, afforded an average profit to the proprietors ...per cent. on their capital.

... Bridges, Aqueducts, and Tunnels, which have ...erected in connexion with roads and canals, are ...magnificent and numerous than those of any other ...try in the world. To estimate their number would ...fficult; but we may mention, that, in London, the ...ster and London bridges alone cost very nearly ...and a half millions of money. The iron bridges ... have been erected in different places, are the ...ration of all foreigners. Their arches are ...ed of a number of strong ribs of metal, standing ...from each other like the joists of a house, and on ... the floor or roadway is formed. Bridges of sus... are one also common, in which the roadway is ...ded by iron bars, from strong chains which are ... in the earth, and then hung over high pillars at ...end of the bridge; by this means bridges can be ...ructed over deep and broad waters, where it would ... been altogether impossible to stretch an arch of ...other kind. On a well-frequented road, bridges cost... L.14,000 or L.16,000 are often constructed merely to ...ce the distance by a mile or two, or to avoid an ...minent ascent in the old track. Were it possible ...imate the amount of capital laid out on this kind ...provement alone, it would be almost incredible.

...e number of *Railway Companies* incorporated by ...f Parliament up till January 1835, in Great Bri... and Ireland, was 107, and the capital which they ... allowed to raise by shares was L.41,610,614; they ... besides allowed to raise by loan L.16,177,630. A ...derable number of these railways being jobbing, ... least crude speculations, have never commenced, ...the number of railways actually begun to be pro... or finished at the beginning of 1840, in the United ...dom, was only about fifty. The principal lines are ...e Liverpool and Manchester Railway, about thirty-... miles long, and uniting these populous towns; the ...don and Birmingham Railway, about one hundred ...twelve miles long, connecting the metropolis with ...centre of England; the Grand Junction Railway, ...ming the London and Birmingham line to that of ...rpool and Manchester, and also to a railway pro... northward to Lancaster, and thus forming a ...important thoroughfare obliquely across the coun... the Midland Counties, North Midland, and Great ...h of England Railways, connecting the great seats ...ade in Northumberland, Durham, Yorkshire, and ...shire, with the London and Birmingham line; ...Newcastle and Carlisle Railway, connecting these ...s; the Great Western Railway, about one hundred ... seventeen miles long, connecting London with ...ol, and with smaller tributary lines opening up the ... of England; the South-Western Railway, about ...nty-seven miles long, connecting London with ...hampton; the Manchester and Leeds Railway, ...necting these populous towns. In Scotland, the ...burgh and Glasgow Railway, and the Glasgow and ... Railway, are the principal lines. The most pro... of all the lines is that of the London and Bir...ham, the weekly revenue of which is upwards of ...,000: the weekly revenue of the Grand Junction, ...ch joins it, is L.9000.*

...ocks, Piers, and Lighthouses.—Docks are artificial ...s built of stone for the reception of ships: they ... of two kinds, wet and dry. A dry dock is a recep... where vessels are built or repaired; after which ...ible is admitted by flood-gates, and they are floated ...to sea. Wet docks are constructed for the use of ... when loading and unloading, it being found that ...n they are allowed to settle down unequally on the ... or sand of rivers and harbours, their timbers are ...ken, and the vessels considerably damaged; in the ...docks they are kept always afloat. The capital ex...ded by some of the dock companies in London is ...mmense. The capital expended by the London Dock Company in purchasing ground (chiefly the sites of houses and streets) was more than one million; and the whole cost of the works was L.3,938,310.

The docks at Liverpool have an area of water of about 91 acres, and the quay space is nearly eight miles in total length. The business transacted may be conjectured from the fact, that the dues paid by vessels entering the docks in 1840, was L.197,477, 10s. 6d. Few of the large sea-ports are without the accommodation which docks yield to commerce; those at Leith contain ten acres of water-room, and have cost L.285,100. It would be idle to attempt a description or even enumeration of the immense number of piers and harbours which have been constructed at the different sea-ports. At every place where the profits of trade seemed to authorise such erections, capital was seldom deficient to complete them.

The *Lighthouses* of Britain are perhaps the most remarkable part of the nautical apparatus of the islands. The capital expended upon them has been large, and the skill with which some of them, such as the Bell-Rock and Eddystone lighthouses, are constructed for durability in the midst of a tempestuous sea, could only have been exhibited in a country where mechanical science existed in its highest perfection; and there is hardly a dangerous or doubtful point along the coast where the mariner is not guided by a light on some headland or rock. There is, however, much complaint concerning the dues levied from ships for lighthouse expenses; some of them are held as profitable calls by private families, and in others the money levied is applied to purposes quite unconnected with lighting.

SOCIAL STATISTICS.

The population of the United Kingdom consists of various classes of persons, amongst whom, with respect to wealth, education, and general condition, even more than the usual differences are to be found. Notwithstanding great improvements in agriculture of late years, the country cannot produce wheat, oats, and other cereal grains, in sufficient abundance to meet the demands of a daily increasing and hard-labouring population, and what is deficient is excluded, except at high duties, which render the price of bread higher than it is elsewhere in Europe.* Without entering minutely into this great and much debated question, it may be mentioned as a general result, that the difficulty of purchasing food leads to a corresponding depression of circumstances in the humbler orders of the community, and either causes an extensive dependence on poor-rates for support, or produces debased and dangerous habits of living. The poor of England are entitled by law to support in workhouses, according to the provisions of an act of Parliament passed in 1834; in 1839, the money expended on paupers in England was L.4,406,907, being only about two-thirds of what had, during some years, been expended under a somewhat different system, and a less careful administration of funds. In Ireland, a similar poor-law has lately been introduced, and is likely to prove of great service to that part of the empire. In Scotland, none but the impotent or very aged poor can legally claim relief from the parish funds: these are very inadequately supplied. The humbler classes are accordingly, in many places, in a very miserable condition. The entire outlay for the parochial poor in Scotland was lately no more than L.140,000.

The present condition of society throughout the United Kingdom exhibits the spectacle of great and valuable efforts at improvement among the more enlightened classes. Within the last ten years, the utility of the press has been immensely increased, and works of instruction and entertainment have been circulated in

* The annual consumption of all kinds of grain in the United Kingdom was, a few years ago, estimated at 52,000,000 quarters, about a twelfth part of which would require to be imported. All ordinary kinds of animal food, of foreign produce, are entirely excluded.

...ROADS, CANALS, AND RAILWAYS, for further in...

departments of society where formerly nothing of the kind was heard of. The establishment of mechanics' institutions, lyceums, exhibitions of works of art, reading societies, and other means of intellectual improvement, forms another distinguishing feature of modern society. At the same time, great masses of the people, for lack of education, and from other unfortunate circumstances, are evidently gravitating into a lower condition. From these reasons, and others connected with the development of our manufacturing and commercial system, convictions for crime have been latterly increasing. In 1837, there were 17,090 convictions for crime in England. The late establishment of an improved prison system in Scotland, independently of other advantageous circumstances, is expected to greatly lessen the number of offenders in that part of the empire.

England is now provided with a law for enforcing the registration of births, marriages, and deaths; but in other parts of the empire, Scotland in particular, the arrangements for these useful objects are very imperfect. During the year ending June 30, 1839, the number of births, marriages, and deaths, in England and Wales, was as follows:—births, 480,540; marriages, 121,083; deaths, 331,007. This enumeration, compared with the previous year, shows, for births, an increase of 80,828; for deaths, a decrease of 4949; and for marriages, an increase of 9602. At the celebration of marriage, parties are required to sign their names; and it appears that, on an average, 33 in the 100 of males, and 49 in the 100 of females, sign with a mark, being unable to write. The average age of men in England at marriage is about 27 years, and of women, 25 years and a few months.

An account of the population of the empire has been taken at intervals of ten years from 1801; and the following table will show the gradual increase which has occurred during these intervals:—

	1801.	1811.	1821.	1831.
England and Wales,	8,872,980	10,163,876	11,978,875	13,894,569
Scotland, -	1,599,068	1,805,688	2,093,456	2,365,807
Ireland, - -	—	4,500,000	6,802,093	7,734,395
Army and navy,	470,500	640,500	319,300	277,017
Totals,	10,942,548	17,109,864	21,193,724	24,271,788

The increase of population has been greatest in the manufacturing districts, where, in some instances, it has been double of those which are merely agricultural; as, for example, the increase in the manufacturing counties of England, from 1821 to 1831, was 22 per cent., while in the agricultural counties it was only 10½. It has been ascertained, that, in 1831, there were of the classes belonging to the aristocracy in Great Britain, from 3000 to 4000 families; of squires and gentlemen, who are land-proprietors, stockholders, money-lenders, &c., from 50,000 to 60,000 families; of learned professions—36,000 clergy of all denominations, about 30,000 lawyers, and 50,000 physicians, surgeons, apothecaries—making 116,000 families, with half as many more dependants; of farming tenants, about 250,000 families, and of their labourers, 400,000 families; of merchants, shopkeepers, and general traders, 900,000 families; of artisans, 200,000 families; of manufacturers in all lines, 500,000 families; of labourers, porters, and servants, 600,000 families; and of destitute paupers, soldiers, &c., 800,000 families.

The statement of the aggregate population of the British islands, affords no idea of the force which is actually employed in agriculture and manufactures. The effective labourers (men) are estimated to amount to no more than 7,000,000, whereas, reckoning the powers exerted in productive industry by animals, mills, steam-engines, and mechanism of various kinds, the force is equal to the strength of more than *sixty millions* of working men.

An estimate was formed a few years ago of the total annual income of all classes of people in the United Kingdom, with the aggregate value of the articles of use and luxury which each produces, and from this we make the following extract:—

Value of agricultural and dairy produce, -	L.236,(
... Mines and minerals, - - - -	21,(
... Inland and foreign trade, - - -	57,(
... Manufactures, - - - - -	143,(
Total of produce and property annually created in Great Britain, -	L.503,(

An estimate was also formed of the value whole property, public and private, which ha created and accumulated by the people of this c and which they now actually possess. This valu the sum is expressed by figures, is so immense, eludes the imagination to conceive it.

Value of productive private property, -	L.2,695,(
... unproductive, or dead stock, -	580,(
... public property of all kinds, -	105,(
Total public and private property, - -	L.3,679,(

The wealth of the empire is distributed in lowing proportions between the three countries:

	Productive private property.	Unproductive private property.	Pul p
England, -	L.2,054,600,000	L.374,300,000	L.4
Scotland, - -	318,100,000	51,100,000	
Ireland, -	622,100,000	116,400,000	1

The proportion which these values bear to the lation in each country is not suggested by the but in England (taking productive and unpro property together) the ratio is L.186 to each in Scotland, L.160; and in Ireland, L.96.

The following is the latest statement of the and population of the empire:—

	Population.	S
British Islands, - - -	24,371,738	
British dependencies in Europe, -	247,701	
North America, Canada, &c., -	1,023,208	
West Indies, - - - - -	894,050	
Australian Colonies, - - -	29,625	
Islands of Ceylon and Mauritius, -	1,034,736	
British possessions in Africa, -	154,046	
East Indian Empire, - - -	89,577,906	
Total, - - -	117,373,300	

This table shows that Britain rules over a p tion about five times as numerous as her own, an an extent of country fifty times as large as the British islands.

WILL THE PROSPERITY OF BRITAIN CONTINUE?

The question is often asked, Will this singular always remain as prosperous, and as much supe the other nations of the world, as they now are! not their far-extended empire, made up of so different elements, one day crumble in pieces! not their unrivalled manufacturing skill be o surpassed, and driven from the market!—their on which their grandeur is founded, be given to o —and their immense national wealth dissipated i rivalship with more skilful competitors? We m swer this question by simply asking another—O does the superiority of Britain rest? It is not large armies or her powerful fleets. These, wh they are, are supported and created by her reso and do by no means give birth to them. It is h mirable form of government, the stability of her tutions and usages, which admit of reform w uproar or revolution, the equality of her laws, t vantages of her insular situation, and, above a mental energy, desire for rational comforts, stea dustry, and perseverance of her people, which given her her present superiority. Whatever n the factious attempts to thwart her advance, or t vent those improvements which are required in ent departments of her affairs, it is our belief th British empire will overcome all impediments career, and, with increasing resources, attain a of greatness far beyond that which has already developed.

DESCRIPTION OF ENGLAND.

...n ancient kingdom of England, inclusive of Wales, ...ming geographically the principal division of the ...nd of Great Britain, and politically the chief divi... of the United Kingdom—the country in which, it ...o boast to say, the arts and institutions of social life ...e made the greatest advance they have ever done ...any part of the world—enjoys a situation which has ...ssionably tended much to make the country what ..., both politically and socially. The island of which ...s the southern and larger portion, is protected from ...bouring countries by a sea of sufficient breadth ...most parts, and sufficiently uncertain in its condition, ...draw almost insuperable difficulty in the way of an ...ading force. Placed in a medium latitude, it is fur... saved by the surrounding ocean from those ex... of heat, cold, and aridity, to which continental ...tries in both higher and lower parallels are often ...ject. While there are some districts, chiefly in the ...st and north, in which an uneven surface prevails, ...country may be generally described as of a level ...d fertile character. Almost every where, the eye ...s upon the evidences of a long-enduring cultivation, ...rich corn-fields and meadows, surrounded by well... hedges and rows of trees; the elm-surrounded ...hite parish church, the clean honey-suckled village, ...d the well-wooded park connected with the residence ...the nobleman, being other notable features ...the landscape. When we turn from merely rural scenes, we see not less striking evidences of an advanced civilisation, in frequent brick towns and "towered cities," generally overhung by clouds of smoke resulting from the coal every where used for domestic, if not also for manufacturing purposes. The peculiar features of some of these cities—Liverpool, Hull, and Bristol, vast depôts of mercantile shipping; Manchester and Birmingham, sites of extensive manufactures; London, in itself a superb part, the seat of the government and the residence of a class of unprecedented wealth and splendour—will be more particularly adverted to in the sequel.

England is situated between 50° and 55° 45′ north latitude, and 6° west and 1° 50′ east longitude, from Greenwich Observatory. On the north, the only direction in which it is not surrounded by the sea, it is divided from Scotland by a series of rivers and a chain of mountains. The greatest length, from Lizard Point in Cornwall to Berwick-upon-Tweed, is 400 miles; and the greatest breadth, from St David's Head in Pembrokeshire to the east of Essex, is 300 miles. The area has been variously estimated at 50,337 and 57,900 square miles; it has also been estimated at 37,784,400 acres, of which only about a fourth part is said to be uncultivated.

England is divided into fifty-two counties, forty of which form England Proper, while twelve belong to Wales. They may be thus enumerated:—*Southern counties*—Cornwall, Devon, Somerset, Dorset, Wilts, Hampshire, Berkshire, Sussex, Surrey, and Kent. *Midland Southern Counties*—Middlesex, Hertfordshire, Bedfordshire, Buckinghamshire, Oxfordshire, Gloucestershire, Cambridgeshire, Huntingdonshire, Northamptonshire, Warwickshire, and Worcestershire. *Midland Northern Counties*—Rutlandshire, Leicestershire, Staffordshire, Nottinghamshire, and Derbyshire. *Eastern Counties*—Essex, Suffolk, Norfolk, and Lincolnshire. *Counties bordering on Wales*—Monmouth, Herefordshire, Shropshire, and Cheshire. *Northern Counties*—Lancashire, Westmoreland, Cumberland, York, Durham, and Northumberland. *Counties in South Wales*—Glamorganshire, Brecknockshire, Caermarthenshire, Pembrokeshire, Cardiganshire, and Radnorshire. *Counties in North Wales*—Montgomeryshire, Merionethshire, Flintshire, Denbighshire, Caernarvonshire, and Anglesea. The capital city is LONDON, which is also the metropolis of the United Kingdom. The counties are subdivided into hundreds, wapentakes, tithings, &c., the whole containing 25 cities (inclusive of London), and 172 boroughs. For ecclesiastical purposes, the country is divided into 11,077 parishes; the largest number in any county being 475, in Somersetshire, and the smallest 32, in the county of Westmoreland.

Owing to the limited extent and insular position of England, it contains no rivers comparable in magnitude to those of various continental countries. There are, nevertheless, some fine navigable streams, as the

Thames, Medway, Humber, and Tyne, on the east side of the island, and the Mersey and Severn on the west side. The Trent, Ouse, Tees, Wear, Dee, Avon, and Derwent, are minor, but not inconsiderable rivers, besides which there are many of inferior importance. England contains no large lakes; but those of Cumberland, Westmoreland, and Lancashire, though of small size, are celebrated for the picturesque scenery by which they are surrounded.

Wales and the west side of England generally are mountainous. The chief ranges of mountains in this district have been classed under three heads—the *Devonian Range*, stretching from Somersetshire, through Devon, into Cornwall, and terminating with the promontory of the Land's End; the *Cambrian Range*, extending from the Bristol Channel through Wales; and the *Northern* or *Cumbrian Range*, stretching from Derbyshire, through Cumberland, and passing into Scotland. None of the individual hills exceed 3000 feet in height, except a few in Wales; the highest being Snowdon in Caernarvonshire (3571 feet). In the central and eastern parts of England (south of Yorkshire), there are a few ill-defined ranges of swelling eminences, but none which reach the altitude of 1000 feet. Besides Snowdon, the principal eminences in England are David (3427 feet) and Llewellen (3469), both in Wales; Skafell (3166), Skiddaw (3022), and Saddleback (2787), in Cumberland; and Helvellyn (3055), in Westmoreland. The loftiest points in the Devonian range are not more than from 1000 to 1200 feet in height.

GEOLOGICAL STRUCTURE.—SOIL.—

The surface of England includes specimens whole extent of the series of ro , fr which are found in the ra m west, to the lowest of the several districts in the south-e ter to these divisions being found i , in pr ing from the west and north towards the east and south.

In Cornwall and Devonshire, eminences of granite, serpentine, and felspar porphyry, occur, while the slopes resting on them are composed of different kinds of slate. The granite of this district is extensively used for paving in London, though considered less hard and durable than that brought from Scotland. The Welsh mountains are composed chiefly of varieties of slate, with some intermixture of volcanic rocks, as basalt and trap; while a rich coal-field, one hundred miles in length and from five to ten in breadth, rests upon their southern verge, extending from Glamorgan into Pembrokeshire, being the largest coal-field in Great Britain. The northern range of mountains is also chiefly composed of slate rocks, there being only one mountain of granite near Shap in Westmoreland.

Between these ranges of mountains and a line drawn from Exmouth through Bath, Gloucester, Leicester, Nottingham, and Tadcaster, to Stockton-upon-Tees, the surface is composed of the lower secondary strata, including rich beds of coal, the existence of which in this situation is mainly what has enabled England to become the first manufacturing country in the world. The eastern parts of the counties of Durham and Northumberland, from the Tees northward to Berwick, form a peculiarly valuable coal-field, of numerous beds, from which the metropolis and other cities in the east of England and elsewhere are supplied with this important mineral. Another coal-field of great value, and that upon which the manufactures of Manchester depend, extends northwards from Macclesfield to Oldham, and thence westwards to Prescot near Liverpool. A coal-field near Wolverhampton, in Staffordshire, is the most valuable in the centre of England: upon it depend the extensive metallic manufactures of Birmingham.

To the east of the line drawn from Exmouth to Bath, and thence by Gloucester, Leicester, and Tadcaster, to Stockton-upon-Tees, we find the upper rocks of the secondary formation, presenting in succession red sandstone and red marl, lias limestone and clay, oolitic limestone, green sand , clay, and finally chal Connected with the red great strata of rock-s are found; these are t ely dug in Cheshire a Worcestershire for dom e. Lias, which extend m Lyme in etshire Whitby in Yorkshire, hle rer hich it presents of th saurian reptiles. Beds of oolite limestone, rom the small egg-like globules contained in i cover he southern part of Gloucestershire, and a gre part Oxfordshire, Northamptonshire, Rutlandshire and the eastern side of Lincolnshire. The Portland stone, so extensively used for building, and which is quarried in the Isle of Portland, belongs to this class of rocks. The chalk exists every where to the south-east of a line commencing near Dorchester on the south coast, and passing through Wilts, Berks, Norfolk, and so on to Flamborough Head—excepting in Sussex and Kent, where it has been carried off by denudation, exposing a peculiar formation called the *wealden*, and in the bed of the Thames near London and one or two other places, where tertiary beds o occur.

re, containing about three parts metal out o four. found in thick veins or vertical beds in the g of Cornwall, where it has been wrought since the conquest of the country by the Romans. Copper-ore is also found extensively in that district generally in continuation of veins, which, in the upper parts, have been composed of tin-ore; and in several of the same veins, lead, zinc, and antimony are found. A mountain of copper-ore, named Parys Mountain, has long been wrought in the Isle of Anglesea, but is supposed to be nearly exhausted. Next in nce to coal, as a mineral product, is iron, which extensively diffused throughout England, though wrought in the neighbourhood of coal, on ac of that fuel being required for smelting it. In 1839, this valuable metal was produced in South Wales to the amount of 380,000 tons. The chief other districts where it is wrought are Staffordshire, Worcestershire, and Yorkshire; the entire produce in that year being a million of tons. In an account of the mineral productions of England, it would be improper to overlook its clay, so extensively used in the manufacture of pottery (chiefly in Staffordshire), and in making bricks and tiles for building.

The great south-east division of England, in which comparatively level surface prevails, exhibits a soil which is either chiefly chalky, or chiefly clayey, according to the character of the substratum. Interspersed are a few sandy tracts, of which Bagshot Heath may be cited as an example. In the mountainous districts, the usual light soil resulting from the early rocks prevails, excepting where, in the north, there has been a peaty admixture. Upon the whole, England may be said to possess a large proportion of good and productive soil. Probably not above one-ninth of the entire surface (Wales being included) is unsusceptible of tillage.

The climate of England is, as already mentioned, remarkable for its exemption from extremes of heat and cold. It displays an uncommon amount of variation within a narrow range. The average temperature in winter is about 42° of Fahrenheit; in summer, the day temperature is generally about 62°. It is only on occasions that the thermometer reaches 80°, or sinks below 20°. The neighbourhood of the sea, which partly accounts for this moderation, is also the cause why the climate of England is more humid than is usual in continental countries of similar latitude. Being inclined to cold and damp, it is more favourable to the growth than to the ripening of vegetable productions. It is certainly not unfavourable to either the physical or moral condition of the people. Perhaps even its uncertainty has been the subject of too much grumbling. On this point we may adduce the cheerful opinion of Charles II., as recorded by Sir William Temple. "We must needs," says Sir Willi , "add one thing more in favour of our climate, h I heard the king s

thought now and right, and truly like a king of
nd that loved and esteemed his own country: it
reply to some of the company that were reviling
imate, and extolling those of Italy and Spain, or
t of France. He said he thought that was the
osate where he could be abroad in the air with
re, or at least without trouble and inconvenience,
ost days of the year, and the most hours of the
and *this he thought he could be in England more
-any other country in Europe.*"[1] Devonshire and
adjacent districts on the southern coast enjoy a
mature which in winter is, at an average, two,
four, and even in some instances five degrees
the rest; and these districts are therefore re-
orded for the residence of persons affected by
nary disease.

VEGETABLE PRODUCTIONS.—ANIMALS.

e most conspicuous feature in the botany of Eng-
is the fresh and luxuriant herbage, resulting from
umidity of the climate, and which, though apt to
overlooked by the natives from familiarity, never
o strike the minds of foreigners with surprise.
rch of the surface was formerly under wood; but
ast few ages been chiefly confined to particular
s, to the neighbourhood of great mansions, and
closures of fields. Several large royal forests
ist in England, the most considerable being New
st in Hampshire (60,942 acres), and Dean Forest
Gloucestershire (23,015 acres). That of Windsor,
h derives from its situation and the poetry of Pope,
ch smaller, being only 4402 acres. These were
ally the scenes of courtly sport, but are now in
reduced to cultivation, or reserved for the pro-
on of timber to be used for the public service. The
around the seats of the nobility and gentry are a
ar and most inviting feature of the English land-
. A mixture of green open glades with masses of
ll-grown timber, they are scenes of great sylvan
y; while the existence of so much pleasure-re-
l ground in a country where nearly every acre
d be profitable under tillage, conveys a strong
ression of the opulence of England. The principal
are the oak, elm, beech, ash, chestnut, sycamore,
r, and willow. The vine was at one time exten-
y cultivated in southern England, but is now seen
in a few detached places.

e leading grain in England is wheat; barley, oats,
ye, being in a great measure local to the less fa-
ed districts. The turnip and potato are almost
y where cultivated; and peas, beans, and clover,
xtensively diffused. Hops are produced in the
ties of Surrey, Worcester, and Hereford. Hemp,
and some other useful productions of the soil, are
conspicuous. The principal fruit-trees are the
, pear, cherry, and plum; but many others are
ised under particularly careful circumstances.
English garden produces a great variety of pot-
, most of which have been introduced from the
nent within the last three centuries.

the useful animals, England possesses a consider-
variety. Her draught-horses are remarkable for
bulk, generally fine condition, and great strength.
rse and riding-horse have been improved by the
ood of Arabia and Barbary. There are excel-
breeds of both sheep and cattle; and the pig is also
nimal in prime condition, and extensively reared.
of the ancient wild animals, as the wolf, boar,
beaver, are now extinct; and others, as the stag
wild-ox, are very rare. The hare, partridge, and
asant, are the chief game animals, grouse being
found, and that in small amount, in some of the
thern wolds. Most of the smaller quadrupeds,
, insects, &c., common in the same latitude, are
d in England. The nightingale is said to be not
d farther north than Yorkshire. The rivers pro-
trout, perch, &c., and the adjacent seas abound
herring, mackerel, sole, pilchard, and other edible
.

Agriculture is, in England, in a progressive state, but is yet not nearly so far advanced as in the better parts of Scotland. Previous to the eighteenth century, no advance had been made from the most simple modes of tillage and husbandry. The chief improvements since then are thus enumerated in a popular work:—"The gradual introduction of a better system of rotation, since the publication of Tull's *Horse-hoeing Husbandry*, and other agricultural works, from 1700 to 1750; the improvement of live-stock, commenced by Bakewell about 1760; the raised-drill system of growing turnips, the use of lime, and the convertible husbandry, by Pringle, and more especially by Dawson, about 1765; the improved swing-plough, by Small, about 1790, and the improved threshing-machine, by Meikle, about 1795. The field-culture of the potato, shortly after 1740; the introduction of the Swedish turnip, about 1790; of spring wheat, about 1795; of summer wheat, about 1800; and of mangel-wurzel more recently, have, with the introduction of other improved field-plants and improved breeds of animals, contributed to increase the products of agriculture; as the enclosing of common field lands and wastes, and the improvements of mosses and marshes, have contributed to increase the produce and salubrity of the general surface of the country."

Mr M'Culloch calculates that twelve millions of acres are cultivated in England as follows:—

	Acres.
Wheat,	2,000,000
Barley and rye,	000,000
Oats and beans,	3,000,000
Clover,	1,000,000
Roots (turnips, potatoes, &c.),	1,500,000
Hops and garden products,	150,000
Fallow,	1,350,000
	12,000,000

The value of the crops is estimated by the same writer at L.72,000,000. He also calculates 17,000,000 acres of pasture-land as producing L.70,000,000.

The chief defects of the agricultural system of England are in the modes of tillage. Cumbrous machinery is employed to do what might be better done by a lighter and cheaper kind: thus, five horses, and even more, are sometimes seen at one plough, while the heaviest lands in Scotland require only two. The virtue of draining is scarcely dreamt of in many districts of England, while in Scotland it is in some places doubling the produce, besides improving the salubrity of the climate. English farmers are too little educated to be ready to adopt improved modes of agriculture; and, amongst the class of landlords, these have hitherto been too much overlooked.* It seems surprising, yet is quite true, that in one district of the island of Great Britain, expensive and unproductive modes, scarcely in the least better than those which prevailed during the wars of the Roses, will be followed, without the least suspicion that they are wrong, although other districts, which might be reached by a day's journey, present appearances of a reflecting skill and dexterity, the general diffusion of which would be attended with incalculable benefit to both landlords and tenants. It is gratifying, however, to know that this state of things is not likely to last much longer. The English nobility and gentry are now supporting an agricultural association, which is to proceed after the manner of the eminently useful Highland Society of Scotland, in promoting improvements in this important branch of the national industry. We may therefore hope, in another

* We have been assured that, in some districts, where the stranger is surprised to see the flail still in operation, the farmers and landlords are not unaware of the superiority of the threshing-machine; but, having only the alternative of supporting the labouring class by this means, or in the condition of paupers, they prefer the former. It is needless to remark, that this is only a misapplication of the powers of the labouring class, which can only tend to increase poverty, and which we may hope to see in time abandoned.

generation, to see the splendid soil of England turned to its full account.

THE PEOPLE—THEIR CHARACTER.

The constituent elements of the English population are to be traced in the history of the country. The first inhabitants were Britons, probably a mixed Celtic race, and who, during the time of the possession of the country by the Romans, must have become slightly changed by the admixture of that race. Upon a scattered population of Romanised Britons came the great wave of the Saxon invasion, in the fifth and sixth centuries. The Britons are usually said to have been driven to the west; but probably this was not so much the case as has been generally thought, for it is rarely that any invasion expels the mass of a people from the ground they have long occupied. After this, however, the predominant element of English society was undoubtedly Saxon, the Norman conquest only adding to it a French aristocracy, which little affected the great bulk of the population. The English, therefore, exclusive of the Welsh, who are Britons almost unchanged, may be regarded as in the main a Teutonic people, an admixture of British or Celtic entering into the composition always in less and less measure as we advance from Wales towards the eastern coasts, where the people are nearly pure Saxon.

According to an acute writer, "the Saxon Englishman is distinguished from other races by a stature rather low, owing chiefly to the neck and limbs being short, by the trunk and vital system being large, and the complexion, irides,* and hair light; and by the face being broad, the forehead large, and the upper and back part of the head round, and rather small. In his walk, the Englishman [understanding by this name the Saxon Englishman] rolls, as it were, on his centre. This is caused by the breadth of the trunk, and the comparative weakness of the limbs. The broader muscles, therefore, of the former, aid progression by a sort of rolling motion, throwing forward first one side and then another. * * * The mental faculties of the Englishman are not absolutely of the highest order; but the absence of passion gives them relatively a great increase, and leaves a mental character equally remarkable for its simplicity and its practical worth. The most striking of those points in English character, which may be called fundamental, are *cool observation*, *unparalleled single-mindedness*, and *patient perseverance*. This character is remarkably homogeneous.

The cool observation of the Englishman is the foundation of some other subordinate, but yet important points in his character. One of the most remarkable of these, is that real curiosity, but absence of wonder, which makes the *nil admirari* a maxim of English society. It is greatly associated, also, with that reserve for which the English are not less remarkable.

The single-mindedness of the Englishman is the foundation of that sincerity and bluntness, which are perhaps his chief characteristics; which fit him so well for the business of life, and on which his commercial character depends; which make him hate (if he can hate any thing) all crookedness of procedure, and which alarm him even at the insincerities and compliances of politeness.

The perseverance of the Englishman is the foundation of that habitude which guides so many of his own actions, and that custom in which he participates with all his neighbours. It is this which makes universal cant, as it has been profanely termed,† not reasoning, the basis of his morals; and precedent, not justice, the basis of his jurisprudence. But it is this also which, when his rights are outraged, produces that grumbling which, when distinctly heard, effectually protects them; and it is this which creates that public spirit, to which, on great emergencies he rises with all his fellow-countrymen, and [illegible] he persists until its result astonish even the [illegible] him.

Now, a little reflection will show, that of the three fundamental qualities mentioned, the [illegible] seeming may be, [illegible] amiable than the [illegible] result shall be useful. To a stranger of different constructed mind, the cold observation, and, in particular, the slowness and reserve which must accompany it, may seem unsociable; but they are inseparable from such a construction of mind, and they indicate not pride, but that respect for his feelings which the possessor thinks them entitled to, and which he would not violate in others. The dignity, therefore, which in this case the Englishman feels, is not *hauteur*; and it is as rarely insolent to those who are below, as timid to those who are above him.

In regard to the absence of passion from the English mind, it is this which forbids one to be charmed with music, to laugh at comedy, to cry at tragedy, to show any symptom of joy or sorrow in the accidents of real life; which has no accurate notion of grief or wretchedness, and cannot attach any sort of meaning to the word ecstacy; and which, for all these reasons, has a perfect perception of whatever is ridiculous. Hence it is, that in his domestic, his social, and his public relations, it is perhaps less affection than [illegible] that guides the conduct of an Englishman; and, if any one question the moral grandeur which this sentiment may attain, let him call to mind the example of [illegible] which, just before the victory of Trafalgar, was given by Nelson in the simple and sublime communication to his fleet—'England expects every man to do his duty.' Which is the instance that equals this even in the forged records of Roman glory? Happily, the excess of hatred is as little known to the English as excess of love; and revenge is abhorrent to [illegible] ture. Even in the pugilistic combat he shakes hands with his antagonist before he begins; he seems to strike him when he is down; and, whether vanquished or victor, he leaves his antagonist neither cast down nor triumphant.

The extraordinary value of such a character is obvious enough. British liberty and British commerce are its results: neither the Scottish nor Irish mind would have attained them."*

In this sketch, though clever and forcible, some conspicuous features of the social character of the English are overlooked. The domesticity of the English mode of life is very remarkable, when taken in contrast with the lounging, open-air existence of continental nations. The Englishman delights in his home, spends much of his time in it—a result to which the nature of the climate undoubtedly contributes. He appreciates his home very highly, calls his house his castle, and prides himself on its being inviolable even by the emissaries of the law. The members of the family, his wife, his sons and daughters, are taken along by him in most of his recreations and pleasures. The conjugal tie is deemed peculiarly sacred, insomuch that the slightest dishonour offered to it is universally resented. It cannot be said, however, that the affections of kindred are much recognised in England beyond the nearest class of relations.

The strong sense of rectitude which animates the Englishman is conspicuous in his love of what he calls *fair play*, which he carries even into these coarse amusements, boxing, cock-fighting, dog-fighting, the love of which (now fast declining) forms one of the amiable traits of the national character. His benevolence shines in the liberality of the legal provision for the poor, and in the numberless charitable institutions of all kinds which are supported in the country, as well as in the readiness which the nation has always displayed to hold out a hand of succour to distress in all quarters of the world. Cleanliness of person and household, and a love of comfort both in food and in dress

* Blackwood's [illegible] paine, 1829.

* Plural of iris, the coloured part of the eye, surrounding the pupil.

† The word must not here be understood as implying hypocrisy, of which the Saxon temperament is very innocent.

...nsel-tion, distinguish the people at large. In all ...eal and domestic circumstances, the substantial is ...strongly in view, even while the ostensible object ...moves. The aristocratic institutions of the coun... have mixed, with the sturdy independence of the ...ish character, a considerable reverence for exter... and accidental distinctions, and created a disposi... pervading almost all classes, to hold forth appear... rather above than below their means. For the ... reason, as well as that abstract truths are not ...ly apprehended by the English intellect, there is a ... and general disposition to cling to ancient prac... and forms in both government and law. The rural ...ry and the tradesmen of the smaller towns are ...ally subservient to the landed classes; and it is ...y in large towns that new political dogmas find ...arm advocacy.

...se-racing and field-sports are the chief amuse... of the nobility and gentry, and are practised upon ...e so extensive, and with apparatus so perfect in ... parts, including a breed of horses of the highest ...mics, that they would probably be considered by ...igner as amongst the most remarkable features ...glish life. Amongst the upper and middle classes ...ally, the pleasures of the table are much, perhaps ...ssively, cultivated; dinner, in particular, being gen... followed by an abundance of the wines of Portugal, ...ain, and Germany. The lower classes also live, ...eral, on substantial fare; their favourite beve... are ale and porter; while quoits, cricket, and ...ing, may be described as their most common ...sements.

...HISTORY OF POPULATION.—HEALTH AND LONGEVITY.

...e population of England in the time of the Plan... sovereigns, is believed to have been little more ...n two millions. It has been estimated at 5,500,000 ...06. The progress during the greater part of the ...eenth century was slow; the amount in 1760 is ...med to have been about 6,500,000. In 1801, for ...first time, a regular census was taken; and this has ...n repeated once in ten years ever since, giving the ...wing results:—

1801,	9,472,980	1841,	15,978,575
1811,	10,150,615	1851,	17,934,569

...census to be taken during the year in which this ...k is published, will probably give not less than ...0,000, being nearly a doubling since the beginning ...e present century. The rapid advance of our po... is placed in a striking light, when we consider ..., for the United Kingdom, it is nearly a thousand ...day. Within the last ten years, emigration has ...n proceeding on a scale of unprecedented magni...; yet, even in the years during which it has been ...t active, it has not been sufficient to drain the coun... one-third of the rate at which its population has ...n increased by new births. This rapid increase of ...bers clearly shows that, whatever partial evils there ...be in the condition of the people, the country must ...e the whole have enjoyed for forty years a high ...e of prosperity; for it is quite insupposable that, ...t stationary resources, so many new mouths could ...e been fed, unless there had been, what certainly ...e has not been, a large and general deterioration ...e style of living. It is to be remarked, however, ...t an immigration to a great extent from Ireland has ...n going on for about twenty years, and that gene... the Irish settlers continue in England to live in ...le little superior to that which they followed in ...r own country.

...The increased population has chiefly taken place in ... manufacturing towns. It was calculated by Mr ...Culloch, in 1831, that nearly a third of the people ...e in towns of above 10,000 inhabitants. Most of the ...e cities have experienced a rapid advance of popu... within the last twenty years. These circumstances ...e to show that it is the development of the manu...ring, and not of the agricultural energies of the country, which has mainly tended to increase the population. In 1831, it was ascertained that the total number of persons, above twenty years of age, engaged in any kind of business or professional employment, was 3,594,699. Of these, 1,075,912 were engaged in agriculture; 1,327,727 in trade and manufactures; and 931,031 in other pursuits. Of the last number, 185,187 were capitalists, bankers, and professional and other educated men. In this part of the account we also find the army and navy, and male servants. "It may thus be seen," says an intelligent writer, "how very small is the number of persons arrived at maturity, who are not employed in some one or other of the occupations whereby the sum of the national wealth or convenience is advanced."

With regard to the rate of mortality in England, no certain conclusions were in the hands of the public till the commencement of a general registry of births, marriages, and deaths, in 1838–7. In the first year of the operation of this system, the burials were 335,956, which, if we suppose the population to have then been fifteen millions and a half, would give 1 in 46 per annum as the rate of mortality for the whole country, being considerably more than previous imperfect calculations had made it. There are considerable local variations in the rate of mortality, in accordance with peculiar circumstances. In the last half of the year 1837, the deaths out of 3,553,161 persons, living in large cities, were 47,953; and out of 3,500,751 persons living chiefly in rural situations, only 34,074, or as nearly 34 to 47. For this so much greater mortality in cities, we must look, first to that custom which prevails of retiring in old age and sickness from country to town, and, secondly, to the filth, deficient ventilation, destitution, and vicious habits of life, which prevail in large towns. It is remarkable that London is healthier than most of the other large towns. The proportion who died at 70 out of 1000 persons, was in London 104; but in Birmingham it was 31, in Leeds 79, and in Liverpool and Manchester only 65.

Out of 1000 deaths in the counties of Dorset, Devon, and Wilts, and in Wales, 180 are of children under one year; but in Leeds and its neighbourhood, in the mining districts of Staffordshire and Shropshire, and in the fenny lowlands of Lincoln, Cambridge, and Huntingdonshire, the number was 270, giving token of a great local discrepancy in the sanitory condition of the English population. After deducting the diseases of infancy, the most fatal maladies in England are consumption, fever, and dysentery. One-eighth of the whole deaths, subject to the above deduction, are ascribed to the first of these diseases.

REMARKABLE NATURAL SCENERY—NATURAL CURIOSITIES.

The natural scenery of England is generally of a pleasing rather than a grand or picturesque character; yet there are some portions of the country which are considered attractive on account of their romantic beauty. We shall notice the chief of these.

The Cumberland Lake Scenery.—The south-west part of the county of Cumberland and the north-west part of Westmoreland, comprehend a range of lofty mountains—Skiddaw, Saddleback, Helvellyn, and some others of scarcely less note—amidst which lie the lakes for which this district of England has long been celebrated. The largest of these are Ullswater, Thirlmere, Derwentwater, and Bassenthwaite; but some of less size, as Buttermere, Crummockwater, Loweswater, Ennerdale, Wastwater, and Devock-lake, are scarcely less admired. The vales or passes amongst the hills likewise contain much beautiful scenery of a wild character, although perhaps only traversed by a brawling mountain rill.

The combination of alpine wildness and grandeur, with the soft scenery which reposes in clothed slope and mirror-like lake at the bottoms of the hills, is what gives the Cumberland scenery its principal charm. Ullswater, which extends into Westmoreland, is thought to possess the greatest beauty: it is about

nine miles in length, but nowhere more than one in breadth. Derwentwater (often termed Keswick Lake, from its vicinity to the town of Keswick), which

Derwentwater or Keswick Lake.

measures three miles in length by one and a half in breadth, is only inferior to Ullswater. Mrs Radcliffe, the eminent novelist, describes it as having peculiar charms, both from beauty and wildness. "The whole is seen at one glance, expanding within an amphitheatre of mountains, rocky but not vast, broken into many fantastic shapes. The precipices seldom overhang the water, but are ranged at some distance; and the shores swell with woody eminences, or sink into green pastoral margins. The bosom of the lake is spotted by several small but well-wooded islands."

Amongst the *passes*, that of Borrowdale is the most remarkable: it is a narrow chasm opening from the centre of the amphitheatre which terminates the expanse of Derwentwater, and traversed by the vehement little stream of the same name. Near the entrance of the pass is a detached mountain called Castle-Crag, with a peaceful village reposing at its foot; and opposite to Castle-Crag is the *Bowderstone*, a huge mass of rock, which has apparently fallen from the neighbouring cliffs, and round whose base the road is made to wind. It is computed that this enormous boulder is not less than 1800 tons in weight.

The lake scenery of Cumberland has by its beauty attracted a great number of permanent residents, whose villas enter pleasingly into its landscapes, and amongst whom the present age has seen several eminent literary men—Southey, Wordsworth, &c. It also attracts an immense number of tourists from all parts of the kingdom.

The district usually called *the Lakes* may be said also to comprehend a small northern and nearly detached portion of Lancashire, where Windermere and Coniston Water are sheets rivalling in extent and beauty those of Cumberland.

The Derbyshire Peak Scenery.—The termination of the great northern range in the north of Derbyshire, presents, in that district, a collection of rugged hills and narrow valleys, amidst which some of the most romantic scenery in England is to be found. A particular portion of it, near the village of Castleton, is termed the Peak Scenery, from a particular eminence or peak which attracts more than usual attention.

The *Peak* is approached through a rude and savage pass, named *Winyats* (*q. d.* gates of the winds), flanked with precipices 1000 feet high. It is a limestone mountain, and perforated, as mountains of that kind of rock often are, with an immense cave. On the top are perched the remains of a castle, once the residence of a family descended from William Peveril, a natural son of the Conqueror. In the precipice below, above 600 feet from the top, is the entrance of the cave, a flattish Gothic arch, 120 feet wide and 46 in height. Within this arch the cavern recedes about 90 feet. *Here a company of* twine-makers pursue their humble trade. *At the extremity of the first cave, which alone enjoys any of the light of day*, a low and narrow arch leads *into a spacious opening*, called "the Bell-house," whence a path leads to the "First Whale." The lake 42 feet in breadth, passing below it [illegible] of rocks, in some places not more than 20 feet from the surface of the water. Laying himself flat in the bottom of a small canoe, the visiter with his guide passes through below the depending rocks into an open space 60 feet in length, 200 in breadth, and 121 in height. At the further extremity of this spacious cavern, the stream which flows along the bottom forms itself into a lake called "the Second Water," near the end of which is a pile of rocks subjected to a perpetual copious shower from the roof, and called "Roger Rain's House." Other passages and expansions succeed, till the cave becomes impassable at the distance of 2360 feet from the opening. On returning from his torch-lit adventure to the mouth of the cave, the visiter usually experiences a singular impression of novelty and delight from regaining again the surface of the daylight world.

Entrance to the Peak Cavern.

The scenery adjacent to the neighbouring town of Buxton is also much celebrated. One of the most remarkable objects is *Elden's Hole*, a perpendicular opening into which a line has been dropped to the extent of 1200 feet without finding the bottom. *Poole's Hole* is also remarkable for its magnificent stalactites. A number of beautiful valleys, situated amidst rugged mountains, lead to the romantic one of *Matlock*, where the banks of the Derwent are bordered by extensive woods, intermingled with the boldest and most varied forms of rock. A wilder character is the celebrated *Dovedale*, through which River Dove traverses a pass of two miles in length, of the most striking character. The sides of the valley are chiefly composed of rocks of grey limestone, which, in their abrupt and towering ascent, present innumerable fantastic forms—spires, pyramids, &c.—and are clothed with yew-trees, the mountain ash, and numerous mosses and lichens.

The Isle of Wight.—This island, situated off the coast of Hampshire, and measuring twenty-three miles by about thirteen, is celebrated both for its mild climate and its beautiful scenery. From the high ground formed by a range of chalk hills in its centre, delightful views, mingling the bold objects of the sea-line with the sail-studded English Channel, are obtained. The south shore is the most noted for its romantic objects, the most remarkable of which is at Shanklin. Here a great chalk cliff has at one time been continued to the sea; but, afterwards undermined by the action of the waves, a large portion of it has fallen in huge vast fragments, leaving a new cliff at the distance of half a mile from the shore. In the interval between the beach and the cliff, the fragments are scattered in confusion, many of them forming eminences of picturesque forms, while the intermediate space affords room for cottages and villas, and even at one point a small rising town, nestling amidst the most luxuriant shrubbery, natural and artificial. This district, viewed from the sea, appears a series of gigantic steps rising from the beach towards a great perpendicular wall. The cliff in several places opens in vast chasms, locally termed *chines*, which are usually clothed with picturesque vegetation, and the most admired of these are those of Shanklin and Blackgang. The

believed that they were the temples of the Druids. The most remarkable Druidical circle is that of *Abury*, six miles from Marlborough, in Wiltshire: there is an outer circle, 1400 feet in diameter, composed of stones generally about 16 feet in height, with a distance of 27 feet between every two. There are small concentric circles within the large one, and in the centre of all is a cromlech or altar for human sacrifices, composed of one long flat stone, supported by two upright ones. Two straight avenues of approach, about a mile in length, were composed of similar blocks, and on the outside of the outermost circle there was a vallum or bank, the inner slope of which was perhaps a place for spectators. From the encroachments and carelessness of the neighbouring inhabitants during a long course of ages, this curious relic of the British people is much dilapidated. Another Druidical circle of great note is that of *Stonehenge*,

Remains of Stonehenge.

upon Salisbury Plain, a district also presenting many small and other vestiges of the Britons. The Stonehenge temple, in its perfection, consisted of 140 stones, arranged in two concentric circles, the outermost 108 feet in diameter, with similar stones laid flatwise along the tops of the upright stones. The blocks which remain are from eighteen to twenty feet high, and about seven feet broad. Within the inner circle are two oval ranges, supposed to have formed the *adytum* or cell, and which consist of stones about thirty feet in height. The remains of this stupendous temple, ruined and shattered as they are, still produce a sensation of awe upon the mind of the beholder.

Roman Remains are now rare and nearly obliterated. The roads formed by this people have in some instances been changed into our present comparatively broad and well-formed ways; in other cases, slight traces of their original pavement, which generally consisted of large stones forming a causeway, are to be found. Between Newcastle and Carlisle are the remains of the two walls built respectively by the Emperors Adrian and Severus, in 120 and 210, to keep out the northern barbarians: the first being a high mound of earth, and the second a rampart of stone, 68½ miles long, running parallel to the first, on the outside. Remains of Roman camps, bridges, villas, baths, &c., also exist in various parts of England. All the towns, the names of which terminate in *chester* or *cester*, are considered as having been originally Roman stations. Near St Albans are the remains of the walls which once surrounded the Roman town of *Verulamium*, the site of the town itself having long been subjected to the plough.

Several of the small churches built soon after the introduction of Christianity still exist, and continue to be used as parish churches. The larger churches connected with monastic establishments, and the cathedrals, which were the seats of bishops, took their rise at a later period, chiefly during the twelfth and thirteenth centuries. This was a time when an enthusiasm existed for founding and endowing monasteries and churches. To it we are indebted for many superb minsters, the solemn beauty of which continues to be a proud possession of our land. Westminster Abbey, York Minster, and the

cathedrals of Winchester, Lincoln, Gloucester, Canterbury, Litchfield, and Salisbury, may be instanced as particularly august specimens of the Gothic style in which all ecclesiastical structures were then built. There are also many ruinous remains of the great abba-

Glastonbury Abbey.

cies of the middle ages: those of Tintern, near Monmouth, Glastonbury, near Wells, and Bury St Edmund's, are of famed beauty. A kindred class of antique structures exist in what are called *crosses*, which consist generally of an elegant tapering Gothic erection, with a small shrine below, and were in most instances erected to hallow the spot on which the remains of venerated persons rested on their way to the tomb.

Caernarvon Castle.

Of the huge castles built by the Norman nobility and by the sovereigns during the first few centuries after the conquest, many specimens still exist, but few which are not in ruins. The Tower of London, built by the Conqueror himself, is an entire and most superb example of this class of structures. Conway and Caernarvon Castles, which, with several others, were raised to overawe the then independent principality of Wales, are also noble specimens. Others may be found in the north, as Lancaster, Carlisle, Newcastle, and Rugby. They usually consist of a great square tower, with ranges of lesser towers, and the whole surrounded by thick and lofty walls, beneath which there was generally a moat or wet ditch. Dover Castle, placed on the top of a lofty cliff overlooking the English Channel, and still kept in good order, is a peculiarly interesting specimen of the Norman fortress.

MANSIONS.

England abounds in mansions in various styles, the seats of her nobility and gentry. Some of these reach a high degree of splendour, both in architecture and internal furnishing, not to speak of the delightful sylvan domains by which they are generally surrounded.

A certain class of English mansions may be described as engrafted upon the fortresses of the middle ages, or upon the priories and abbeys disused at the Reformation. *Warwick Castle*, the seat of the Earl of Warwick, *situated upon a rock forty feet* above the River Avon, *and Alnwick Castle, in Northumberland*, the seat of the *Duke of Northumberland*, are splendid examples of the first class of edifices. The area of the latter building "is divided into three courts, entered through gateways formed in lofty towers. The keep, or citadel, of vast magnitude, and acquires some peculiar grandeur of architectural beauty from 'fair semi-circular towers which protect and adorn it on every side.'" *Newstead Abbey*, in Nottinghamshire, the seat of the late Lord Byron and of his ancestors, may be instanced as a beautiful and impressive example of the domestic mansion founded upon the remains of a monastic building.

There is a class of old mansions which appear to be peculiar to England, and are usually called *Halls*. They date in many instances from the sixteenth century, but may be supposed to have been the favourite form of domestic architecture in the days of the first Tudors. *Haddon Hall*, near Derby, belonging to the Duke of Rutland, is an unusually handsome specimen of this class. They generally present a front, of irregular form, advancing into prominent bows with many windows, and constructed of brick upon a fantastic timber-shaped framework of timber, the exterior of which is left exposed and painted. A variety of angular projections break the line of the roof, and give scope for much carved wood-work. In the interior there is always a goodly hall of oak, with a dais floor, a huge set of oaken tables, and a spacious fire-place. Mr Nash has published a beautiful work, containing views and descriptions of the most remarkable of these charming old mansions, so rich in old-world associations.

Another large class of English mansions are of the style which prevailed in the seventeenth century, and which comprehends many substantial as well as decorative features. Elegant fronts of polished stone, with traces of turreting, ornamented square windows, and tall angular chimney-stalks, strike an untechnical spectator as the principal features of this style, usually called Elizabethan. *Holland House*, Kensington, and *Theobalds*, the seat of the celebrated Secretary Cecil, present apt examples.

The houses built in the last century were chiefly in the Grecian style, more or less pure. Some of the productions of Mr Adam present beautiful examples—for instance, *Keddlestons House*, the residence of Lord Scarsdale, near Derby, the front of which is a line of 360 feet, comprehending a central and two lateral masses connected by low corridors, and universally admired for its classic purity and grace. *Chatsworth*, the seat of the Duke of Devonshire, near Derby, is another magnificent mansion of this class.

Within the last fifty years, houses have been built in various styles, imitative of modes long ago fashionable. The castellated, the Elizabethan, and the Grecian, have all had their admirers. It is also common now-a-days to build houses from the foundation in the manner of those Gothic priories and abbeys which were originally designed for purposes so different.

Eaton Hall, the seat of the Marquis of Westminster, situated near Chester, may be considered as a prime example of the modern Gothic. It comprises, besides other apartments, an entrance-hall, paved with variegated marbles, a music-gallery, adorned with two fine pictures by West, a saloon, decorated with some beautiful specimens of stained glass, and a library. This magnificent mansion is much visited by strangers on account of its architectural beauty, its splendid furniture, and the vast number of interesting objects assembled in it.

CITIES, TOWNS, &c.

It has already been seen that a large part of the population of England is collected in cities and towns of considerable size. Some of these may be classed under the separate heads of manufacturing and commercial towns, while others are either university towns, naval stations, cathedral towns, or towns for summer recreation or the residence of persons in independent circumstances. The cities and towns of England are of great number, and, though often of plain outside

…ale an immense amount of wealth. The prevalence …ork in domestic buildings, and of the smoke arising …m coal fires, gives a peculiar character to English …es. In all, however, there are numerous churches …ellow public edifices, and in some there are many …ete front of stone.

…or an account of the capital of England, which …es the manufacturing, commercial, educational, and …rely characters in one, we must refer to a sepa… article, following the present.

Manufacturing Towns.

…d the head of these stands *Manchester*, the chief …e of the principal manufacture of England—that of …on. This town is situated on the River Irwell, in …south-east district of Lancashire, at the distance …182 miles from London. Inclusive of Salford, a …rate municipality on the other side of the Irwell, …also comprehending a few connected villages, Man…ster contained in 1851 a population of 379,393, …probably increased to 340,000. The ground on …h it stands is a perfect level, and, from whatever …it is approached, its crowd of spires, towers, manu…ories, and warehouses, appears mingling with the …ke that hangs over it. The older part of the town …ters round the collegiate church, an elegant and …ense structure of the time of Henry VII., or ex…ts in the ancient street called Deansgate. The busiest …mercial street is Market Street, and the most ele…t is Mosley Street. The town contains most of the …al public buildings to be found in one of its size—a …n-hall, infirmary, prison, exchange, &c., besides …eral institutions of a literary and scientific character; …several of these buildings, particularly the two first, …of remarkable elegance. A botanic garden, about …ile from the outskirts of the town, is a great orna…nt, and forms a most delightful as well as instruc…e place of reservation. There is also a zoological …den.

…The factories of Manchester exceed a hundred and …enty in number: they employ between thirty and …y thousand persons, and steam enginery equal in …wer to five thousand horses. About four-fifths of …e cotton manufacture of the kingdom centres in Lan…shire, and of this a large proportion is confined to …nchester. The woollen, linen, and silk trade, parti…larly the last, and many smaller manufactures, as of …s, pins, umbrellas, &c., are also carried on to a large …ent in this town. It may be added, that the making …machinery has of late years become a thriving trade …Manchester.

…Manchester is connected with its port Liverpool by …ailway, and, by means of the Irwell and numerous …nals, it transports and receives goods to and from …ery parts of the kingdom. (See article CANALS AND …AILWAYS.)

…The above may be considered as an outline of this …at seat of manufacturing and commercial industry. …ould to describe the bustle of waggons and human …ings on its streets, to detail the vast mercantile trans…tions in which it is engaged, or describe its numerous …ctories and workshops of various kinds, would re…ire a separate volume. In the way of details, we …n only afford room for a description of two or three …rking establishments, which we find in a neat local …lume, entitled *Manchester as it is*:—

"Many of the mills are immense buildings, raised to …e height of six, seven, and eight storeys, erected at …e expense of many thousands of pounds, and filled …th machinery costing as many more. The capital …ed in a single mill will sometimes be £50,000, and …equently is as much as £100,000. Some of the mills …ntain nearly 2000 hands. A visit to one of the largest …lls, if an introduction can be procured, is a gratifying …ast. The rooms are kept in the most perfect state of …eanliness, and the strictest order and regularity pre…ail. Every operation is performed by rule, and the …bdivision of labour is carried out in the most minute …anner. The *mills and factories are of various sorts*, namely, cotton spinning-mills, silk spinning-mills, woollen spinning-mills and factories, small-ware factories, and power-loom weaving factories.

Amongst the cotton mills, one of extraordinary extent, belonging to Messrs Birley & Co., is situated in the suburb called Charlton-upon-Medlock. It consists of a group of buildings, upon which, including machinery, several hundred thousand pounds have been sunk. The number of hands employed by this firm is 1600, whose wages annually amount to the sum of £40,000. The amount of moving power is equivalent to the labour of 397 horses. The number of spindles in the mills is about 90,000. The annual consumption of raw cotton is about 4,000,000 lbs. weight! The annual consumption of coal is 9000 tons. It will perhaps excite surprise in a person unacquainted with the nature of machinery, when informed that the annual consumption of oil, for the purpose of oiling the machinery, is about 3500 gallons; and the consumption of tallow, for the same purpose, 50 cwt. The annual cost of gas is £900. One room alone, belonging to this firm, contains upwards of 600 power-looms. Besides the hands engaged in the cotton department, the following description of mechanics are employed in this mill:—Millwrights, mechanics, joiners, bricklayers, plumbers, painters, moulders, turners, and smiths.

The establishment in which the fabric is manufactured for waterproof clothing, such as '*Mackintosh Cloaks*,' belongs to Messrs Birley & Co., and is a part of their concern. The number of hands employed in this business varies from 200 to 300. The immense amount of 250,000 lbs. weight of Indian rubber is annually consumed in the process of manufacture, to dissolve which 100,000 gallons of spirits are employed.

In the establishments called small-ware mills, of which there are several in Manchester, the articles of cotton, worsted, and silk tapes, are very extensively manufactured. To trace the various processes a piece of tape passes through, and the various employments it affords, before it comes into the market, is a very curious and interesting occupation. Beginning, then, with the first commercial operations—The cotton used in the manufacture of tapes, having been warehoused in Liverpool, is sold on account of the importer, and bought to the order of the manufacturer by cotton-brokers. It is conveyed by canal or railway to Manchester; and when delivered at the works of the purchaser, is weighed, assorted, mixed, and spread, with a view to obtain equality in the staple. It is then taken to the willowing-machine to be opened and rendered floculent; thence it is transferred to the blowing-machine, which cleanses it from dust and makes it feathery. Attached to the blower is a lapping apparatus, by which the cotton is taken up and laid in a continuous fleece upon a roller, in order that it may be conveniently carried to the carding-engine, there to be made into a fleece of the most equable texture possible; thence it is handed to the drawing-frame, where it is blended with the production of all the carding-engines connected with the particular set or system to which it belongs. It is next passed through the slubbing-frame, afterwards through the jack or roving-frame, and then through the throstle or spinning-frame, upon which it is made into yarn or twist. From the throstle, the yarn, if intended for warp, is forwarded to the winding-frame, but if intended for weft, to the reeler; afterwards, that which is wound is delivered to the warper, that which is reeled, to the pin-winder. The weaver next operates upon it, passes it through the loom, rubs up the tape, and consigns it to the taker-in, who examines the fabric, and transfers it to the putter-out, who sends it to the bleacher. When bleached, it is handed to the scraper, whose business it is to take out the creases, and open the tape, by running it under and over iron-scrapers. This having been done, the piece is put through the callender, when it is pressed between hot bowls and rendered smooth and glossy. It is next taken to the lapping department, where it is neatly folded by young women, after which the maker-up

forms the pieces into parcels, containing the required quantity, and places them in a powerful press to make them compact. He next papers them, and sends them to the warehouse for sale.

Some idea of the extent to which this manufacture is carried on in Manchester, may be formed from the fact, that, at the works of Messrs Wood and Westheads, upwards of 1,240,000 yards of goods, not exceeding three inches in width, and composed partly or entirely of cotton, linen, silk, or worsted, are woven in *one week*, or upwards of 35,227 *miles* in *one year*.

One of the principal establishments in the department of steam-engine making and engineering, is that belonging to William Fairbairn, Esq., situate in Canal Street, Great Ancoats Street. To persons unacquainted with the nature of working in iron, an admission into these works affords perhaps the most gratifying spectacle which the town can present of its manufactures in this metal. Consequently, almost every person of distinction visiting the town contrives to procure an introduction to the proprietor before leaving it. In this establishment the *heaviest* description of machinery is manufactured, including steam-engines, water-wheels, locomotive-engines, and mill-gearing. There are from 550 to 600 hands employed in the various departments; and a walk through the extensive premises, in which this great number of men are busily at work, affords a specimen of industry, and an example of practical science, which can scarcely be surpassed. In every direction of the works the utmost *system* prevails, and each mechanic appears to have his peculiar description of work assigned, with the utmost economical subdivision of labour. All is activity, yet without confusion. Smiths, strikers, moulders, millwrights, mechanics, boiler-makers, pattern-makers, appear to attend to their respective employments with as much regularity as the working of the machinery they assist to construct.

In one department mechanics are employed in building those mighty machines which have augmented so immensely the manufacturing interests of Great Britain, namely, steam-engines. All sizes and dimensions are frequently under hand, from the diminutive size of 8 horses' power, to the enormous magnitude of 400 horses' power. One of this latter size contains the vast amount of 200 tons or upwards of metal, and is worth, in round numbers, from £5000 to £6000.

The process of casting metal is conducted here on a very large scale. Castings of 12 tons weight are by no means uncommon: the beam of a 300 horses' power steam-engine weighs that amount. Fly-wheels for engines, and water wheels, though not cast entire, are immense specimens of heavy castings. A fly-wheel, for an engine of 100 horses' power, measures in diameter 26 feet, and weighs about 35 tons. In this establishment some of the largest water-wheels ever manufactured, and the heaviest mill-gearing, have been constructed; one water-wheel, for instance, measuring 62 feet in diameter. The average weekly consumption of metal in these works, in the process of manufacturing, owing to the quantity of wrought-iron used, and the immense bulk of the castings, is 60 tons or upwards, or 3120 tons annually.

This extensive establishment forwards its manufactures to all parts of the world. The stranger is told, on inquiry, that *this* article is for Calcutta, *that* for the West Indies; this for St Petersburgh, that for New South Wales; and there are, besides, men belonging to it *located* in various parts of Europe, who are employed, under the direction of Mr Fairbairn, in superintending the erection of work manufactured on these premises."

Leeds, the chief town for the manufacture of cloths, is situated in the West Riding of Yorkshire, on a slope gently rising from the River Aire, at a distance of 189 miles from London. It contains a few streets of handsome houses, but as in many other English manufacturing towns, utility appears to be more in contemplation than ornament or elegance. The population in 1831 was 123,393. There are some goodly public structures as *court-house*, *commercial* buildings, theatre, &c., and the town enjoys the benefits of a liter philosophical society, an institution for the pr of the fine arts, and several public libraries.

Leeds is the centre of a large district devote making of mixed and white cloths. Cloths fabric, and blankets and carpets, are also made considerable quantity; but the mixed and whi form the staple of the business of the distri mode in which these are sold in Leeds, gives for the existence of two public buildings of peculiar nature. They are called respectively th Cloth Hall and the White Cloth Hall. A des of the former, from a popular work, will convey of both. "The Mixed Cloth Hall was erected at the general expense of the merchants. It is rangular edifice, surrounding a large open are which it receives the light abundantly, by a gre ber of lofty windows; it is 128 yards in length in breadth, divided in the interior into six depa or covered streets, each including two rows of amounting in number to 1800, held as freeh perty by various manufacturers, every stan marked with the name of the proprietor. Thi exclusively appropriated to the use of persons w served regular apprenticeship to the trade or of making coloured cloths. The markets are Tuesdays and Saturdays, and only for an hou half each day, at which period alone sales c place. The market-bell rings at six o'clock morning in summer, and at seven in winter, w markets are speedily filled, the benches cover cloth, and the proprietors respectively take their the bell ceasing, the buyers enter, and proce secrecy, silence, and expedition, to bargain for t they may require, and business is thus summaril acted, often involving an exchange of property amount. When the time for selling is termina bell again rings, and any merchant staying in after it has ceased, becomes liable to a penalt hall is under the management of fifteen truste hold their meetings in an octagonal building, near the entrance to this hall."

Huddersfield, *Wakefield*, *Saddleworth*, *Halif Bradford*, all in Yorkshire, and *Rochdale* in Lan are other towns noted for their concern in th manufacture, but of inferior population, and no guished by any remarkable features. *Axminst derminster*, *Ashton*, and *Wilton*, are the chief the carpet manufacture. *Bradford*, in Wiltshire tinguished for superfine cloths.

Birmingham, the chief town in the kingdom i in metallic manufactures, is situated in Warwi at the distance of 109 miles from London. Th part of the town consists chiefly of old build crowded with workshops and warehouses, and buted principally by manufacturers; but the upp has a superior appearance, consisting of new an lar streets, and containing a number of elegan ings. Amongst the public buildings, the town-h for particular notice, being a magnificent struc the Corinthian order, in the proportions of the of Jupiter Stator at Rome. The population of B ham in 1831 was 146,986, being all, except a sm tion, engaged in trade and manufactures.

Amongst the principal manufactures are but immense variety, buckles, cloak-pins, and snuff toys, trinkets, and jewellery; polished steel watch corkscrews, &c.; plated goods for the dining a table, now in the way of being superseded by goods of mixed metal; japanned and enamelled a brass work of every description; swords and fir medals and coins of various kinds; copying m and pneumatic apparatus; grates, fire-irons, g burners, nails, and steel-pens. Besides almost metallic article which can be considered as u useful, or ornamental, cut crystal is produced to extent, while certain branches of the cotton tra nected with hardware, as the making of the cl umbrellas, braces, girths, &c., have also fixed

s here, in order to facilitate the preparation of
e articles.
he operations of the Birmingham manufacturers
carried on chiefly by means of foundries, rolling
, die-stamping machines, and turning-lathes. From
nufactories proceed all heavy iron goods, and even a
derable quantity of small wares, though the work
ired in trimming these articles after they leave the
causes a constant tendency towards the use of the
tamp in preference. By the latter machine, not
ons, buttons and other small articles produced, but
ther exceptional decorative articles of many various
s, to which it might be supposed that the process
inapplicable. The rolling mill is a ponderous
ne, for pressing out ingots of metal into sheets of
ious thickness. The lathe, a conspicuous machine
e workshops of Birmingham, is used for the pre-
tion of articles of correctly circular, and also of
form. It is usually driven by steam; and in many
ases this power is not generated in the premises
ose who use it, but is obtained for a rent from some
n kept by a different individual in the neighbour-
.
give an idea of the extent of some branches of
, and the activity of some kinds of machinery at
ingham, it may be stated that, at the pin-works,
years ago, 12,000 pins could be cut and pointed,
,000 pin-heads made from the wire, in an hour;
there is a coining-mill which produces between
and forty thousand pieces of coin in the same
; and that, from 1805 to 1815, 5,000,000 strands of
were made for public and private service. The
ng of steel-pens, which, before 1821, was scarcely
n, is now a great manufacture. Probably not less
10,000,000 are made annually. There is one in-
al in the trade who employs 250 persons, and
mes every year upwards of forty tons of metal.
article was originally sold at the rate of one shil-
each pen; and now, from improvements and faci-
in the manufacture, 144 are sold at the same
y.
effield, in the West Riding of Yorkshire, ranks only
ad to Birmingham as a seat of metallic manufac-
. It is a town of above 100,000 inhabitants, great
of whom are engaged in the business for which
field is remarkable. The situation of the town,
a swelling piece of ground near the confluence of
Sheaf and Don, gives it health and cleanliness, but
the newer streets and suburban villas are neat, and
town is constantly involved in the smoke arising
the manufactories. A music-hall, post-office, and
cal hall, together with a building called the Cutlers'
, in which the members of that trade meet for an
al banquet, are the chief public buildings boasting
y elegance of exterior.
effield was famous in the middle ages for producing
s and arrow heads. From such small beginnings,
vanced in the course of ages to its present distinc-
. An immense quantity of knives, scissors, imple-
s of husbandry, and surgical and mathematical
ruments, is now made in it. The manufacture of
, and of goods in imitation of it, as also of car-
ers' tools, printing types, haircloth, and many other
les, is carried on to an immense extent. The
nufactures of Sheffield have the peculiarity of being
y in the hands of men of moderate capital and
ted business, though there are also a few houses
h engross a vast quantity of the principal trade.
establishments for the grinding and polishing of
ery are among the most striking objects of curiosity
stranger; and the show-room of the Messrs Rogers,
rs to the late king, is a splendid museum, where
the local manufactures may be seen, of the best
ity, and in the finest order.
entry, an ancient city in Warwickshire, 91 miles
London, is a great seat of the manufacture of
ds, and also of watches. Some other manufac-
s, carried on to a great extent in the last century,
ding gauzes and calimancoes, have declined, leav-
ing these alone flourishing. The population in 1831 was 27,070, all except a small portion being engaged in trade and manufactures.

Coventry is an ancient town of note, and contains, besides some good modern public buildings, an old church of remarkable beauty as a specimen of Gothic architecture, and a very curious old hall (St Mary's Hall), used for festive purposes, having a grotesquely carved oak roof, and a piece of tapestry, wrought in 1450, measuring 30 feet by 10, and containing 56 figures. The town was remarkable in early ages for the performance of the grotesque religious dramas called Mysteries, and for the shows and pageants which took place in celebration of the visits of royal personages. One pageant of an extraordinary character has been performed annually ever since the reign of Charles II. It is designed to commemorate a real or imaginary incident, which is thus related: Leofric, Earl of Mercia, who possessed the property of the tolls and services of Coventry, exacted his dues so rigidly, that the inhabitants were greatly aggrieved, and at length Godiva, his pious wife, became their advocate. The earl, wearied by her solicitations, promised to grant her request, if she would ride naked through the town at mid-day. His terms, according to the legend, were accepted, and the countess rode through the town with no covering but her flowing tresses. It is added, that she had modestly commanded every person to keep within doors and away from the windows, on pain of death, but that one person could not forbear taking a glance, and lost his life for his curiosity. The procession commemorative of this occurrence includes the whole of the officials of the corporation, besides a female of easy purchase, who rides in a dress of linen closely fitted to her limbs and coloured like them. The curious person who stole the glance is called *Peeping Tom*, and a wooden image of him is to be seen on a house in the city.

Derby, the capital of Derbyshire, is an ancient but now considerably modernised town, situated on a pleasant slope and irregular ground, on the south side of the vale of the Derwent, a river tributary to the Trent, pursuing a winding course through the county, and of great value in moving mill-machinery. Derby is the centre of one of the most productive and industrious districts in England, particularly as respects the manufacture of iron and other minerals. In the town and its neighbourhood there are large manufactories of lace, galloons, broad silks, silk hosiery, china, marble, jewellery, &c.; several extensive mills and manufactories have been built within these few years, and the machinery is equal to that of any other part of the kingdom. The town is irregularly built, and excepting some new erections in the corn-market, an infirmary, and an old church, with an elegant and conspicuous tower, it owns no public building worthy of remark. Though placed in the midst of a stone district, the houses are as usual built of brick. Within these two years, Derby has come prominently into notice by being on the line of the extended series of railways from Durham and Yorkshire to London, and the station here is of magnificent proportions: the distance from London, 126 miles, is performed by railway in about seven hours. In 1840, the town received from Mr Joseph Strutt the munificent gift of a pleasure-ground, eleven acres in extent, and called by him the Arboretum. It is replenished with walks, seats, and every way fitted up for promenading and recreation; it is opened freely two days of the week to all classes, and on other days is accessible upon payment of a small fee. The population of Derby in 1831 amounted to 23,627.

Carlisle, which in early times was distinguished as a bulwark against the invasions of the Scottish armies, and as a cathedral city, has latterly acquired some note as a seat of manufactures, particularly in the department of cotton-spinning, calico-printing, and the weaving of ginghams, &c. The establishment of a railway communication with Newcastle has within the last few years added to its mercantile prosperity, by rendering it an entrepôt for produce passing from the west coast.

and from Ireland to the populous counties of Durham and Northumberland. Population, 20,006.

Commercial Towns.

At the head of this class stands *Liverpool*, next to London the greatest port in the empire. It is situated in Lancashire, on the east bank of the estuary of the Mersey, at the distance of 36 miles from Manchester, and 204 from London. The town extends for about three miles along the Mersey, and rather more than one mile inland, the situation enjoying a slight slope towards the river. On the side next the country, the town extends into numerous suburban districts, comprehending many villas, the residences of the more wealthy citizens. Liverpool, in 1831, contained 165,175 inhabitants; but, inclusive of the immediate environs, and the persons engaged in navigation, the whole number in 1835 was believed to be not less than 220,000. Its rise has been surprisingly rapid. In the reign of Elizabeth, it was only a small village; in 1700, there were about 5000 inhabitants; in 1760, 26,000; and, in 1801, 77,653.

Liverpool is the grand medium through which the trade of England with Ireland and with America is carried on; and a vast quantity of business is transacted by its merchants with the ports of the Mediterranean, East Indies, and other parts of the world. The leading article of import is the cotton so extensively used in the manufactures of Lancashire, of which, in 1830, out of 793,695 bales imported into England, 703,200 were brought into Liverpool. The rural produce of Ireland, cattle, bacon, poultry, eggs, &c., forms the import next in amount, the value in 1832 being about four and a half millions sterling. The duties paid at the customhouse of Liverpool, in 1837, were L.4,351,496, being about a fifth of those paid throughout the whole kingdom. In the same year, the vessels entered inwards, exclusive of those concerned in the fisheries and coasting trade, were—British, 1685; foreign, 985; in all, 2670. Those entered outwards were—British, 1735; foreign, 1012; in all, 2747. But when the fisheries and coasting trade are included, the number of British vessels entering Liverpool that year reaches the amazing number of 10,281, each being upon an average of 200 tons. Liverpool is the great outlet for the goods manufactured in Lancashire and Yorkshire for sale in America. It is stated that one mercantile house in the American trade, has in one year shipped and received goods to the amount of a million. In connection with the commerce carried on with the United States, there is a large transit of passengers. This was formerly carried on by means of a periodical series of well-appointed and quick-sailing vessels, usually termed *liners;* but, for three years past, it has been conducted by means of steam-vessels. There are also steam-vessels conveying passengers, daily, to and from Dublin, Glasgow, and several Welsh ports, and only a little less frequently to other Irish harbours, and to several ports in the south-west division of England.

The town, thus so extensively concerned in that commerce from which England derives its chief glory, presents many external features not unworthy of its mercantile character. Of these the chief is the *Docks*, a magnificent series of deep-water harbours, extending along the whole front of the town. They are eleven in number, with an aggregate superficies of 111 acres, and eight miles of quays! In the year ending June 24, 1840, the dues paid by vessels entering and leaving them was L.197,477, 18s. 6d. The sight of these docks, bristling with numberless masts, and a scene of constant bustle from loading and unloading, fills a stranger with astonishment.

The town contains several handsome streets, the chief being Castle Street and Dale Street. The Town-Hall and Exchange Buildings form an elegant and impressive assemblage of objects, having a bronze group in the intermediate court, commemorative of the death of Lord Nelson. The Customhouse is, as might be expected, a conspicuous edifice, but in a heavy style of architecture. The other public b the Corn-Exchange, Lyceum, Athenæum, Rooms, Infirmary, &c., are goodly structures. upwards of twenty churches belonging to the ment, many of them of much architectural greater number of chapels belonging to var minations of dissenters; with four Roma chapels, a meeting-house for Quakers, an synagogue. The charitable institutions are and well conducted. About 1500 patients ar annually into the Infirmary. The Blue-Coa maintains and educates about 200 boys and school for the blind is on a most extensive handsome and spacious theatre, and a circus during great part of the year. At the Royal Institution, public lectures are given; and it is a philosophical apparatus and a muse tural curiosities. A botanic garden was est 1801, at an expense of about L.10,000. The a mechanics' institution of unusual extent an having been erected at an expense of L.11,0 cludes schools for the young, as well as for cent; and in the amount of its funds, and var branches of knowledge taught, the establish be described as a kind of university for the working classes of Liverpool. Amongst the able objects connected with the town, the o Cemetery of St James's, formed out of an quarry, is worthy of particular notice. It statue of Mr Huskisson, who was interred i Manchester and Liverpool Railway is noticed

Bristol, a large sea-port town, is situated pa county of Somerset and partly in that of Glo the junction of the Rivers Avon and Frome, ten miles from the junction of the former navigable) with the Bristol Channel. It is or English towns which possess the dubiously ack privilege of being counties in themselves, an the cathedral city for the diocese of Bristol is an ancient town, and has long enjoyed dist a sea-port. Previous to the rise of Liverpool it is now greatly inferior, it was the chief p west of England. It still possesses considera and has further of late years become the sea active and thriving manufactures. In 1837, of 76,957 tons burden, entered the harbour fro ports, besides 632 from Ireland; and in the s the customs duties collected were L.1,153,109 rum, and tea, are the chief foreign imports, chief exports are the native manufactures, a woollen, and linen goods. The chief native tures are soap, glass bottles, various metal drugs, dyes, and soda. It is honourable to Br as in its ancient days of supereminency as sent out the first English vessel across the (that of Cabot, which discovered North Ame in these days, it was the first to establish a cation by steam with the same continent. done in 1838, when the Great Western perf first voyage. The population of Bristol, in 1 117,016.

Bristol is a well-built town, containing many streets and squares, and extending into seve tiful suburban villages, as Clifton, Kingsd St Michael's, where the residences of the citizens are placed. The city contains ma structures of an interesting character. The is a fine old specimen of the Gothic architec the Church of St Mary Redcliffe is consider the most beautiful in England. The "floating h formed out of the ancient beds of the two ri surrounded by an immense extent of quay, i impressive object: the cost of its construction much less than L.700,000. The Guildhall, J mercial Rooms, and Institution (which con brary, hall for lectures, &c.), are other public of an elegant appearance. Clifton, being the well-known hot well, contains a suite of b pump-rooms.

castle-on-Tyne.—This ancient and prosperous commerce occupies a somewhat incommodious n on the left or north bank of the Tyne, at the e of about ten miles from the sea. It is locally county of Northumberland, and by means of a across the Tyne is connected with the populous h of Gateshead, in the county of Durham. It

Newcastle-on-Tyne.

e origin of its name to Robert, the eldest son of a the Conqueror, who erected a fortress on the uff which here overhangs the river, and gave it ne of Newcastle. For ages the town was sur- d by strong walls, as a protection against invad- ttish armies: these, however, have disappeared, modern times the town has spread over the ar acclivities and upland which border the river. l fort or castle still exists, also the ancient Gothic of St Nicholas, whose elegant turret is conspi- it a considerable distance. The main cause of reasing importance of Newcastle is its fortunate n in the midst of the great coal-field of North- land and Durham, the produce of which finds a utlet by the Tyne. The plentifulness of coal to the establishment of numerous manufactures, which are numbered cast and wrought iron, ary, lead, glass, chemical productions, pottery, nd glue. The number of vessels, British and , which entered the port in 1838, was 1835, with n of 242,004 tons. The gross receipts at the house for the same year were L.379,360. The arts of the town near the river exhibit a busy of industry; here are crowded together ship and uilding yards, wharfs for vessels, iron foundries achine manufactories, and all the usual works ted with a great sea-port. The streets in this r are dirty and smoky, but other parts of the re of great elegance. Since 1834, by the ex- linary energy and taste of Mr Richard Grainger, nating architect, a large portion of the town n taken down and rebuilt with handsome stone , amidst which are various public buildings, ng a theatre, an exchange, extensive markets, Newcastle must be considered the metropolis of and populous district, including Tynemouth, and South Shields (all at the mouth of the Tyne), head, Durham, and Gateshead; and with these timately connected by means of the river, rail- or otherwise. At Shields and Sunderland are the depôts of shipping in the coal and other trades. n its remarkable manufacturing and commercial ity, Newcastle is distinguished for its philosophi- l literary institutions, no other town of its kind ing so many inhabitants of cultivated taste. In luding the population of Gateshead, which was , Newcastle and its suburbs had a population of ; but at present it is estimated at 100,000.

(properly Kingston-upon-Hull) is situated at the ce of the River Hull with the estuary of the e, in the East Riding of Yorkshire, of which it is the principal town. It commands an ex- nsive amount of inland navigation, not only by of the Trent, Ouse, Derwent, and other branches Humber, but by means of canals connecting with streams, and penetrating to the very heart of d. It is the principal outlet for the manufactures of York and Lancashire towards the continent of Europe, the chief seat of the northern whale fishery, and one of the most important stations for steam-navigation in the island, having packets of that kind voyaging not only to London, Newcastle, Leith, and Aberdeen, besides many inland places in its own district, but to Rotterdam, Hamburgh, and occasionally to some of the ports in what is more particularly called the north of Europe. Hull was a noted port so early as the reign of Edward I.; and in the seventeenth century it was a great state depôt for arms, on which account the possession of it in the time of the civil war became an object of much importance. The refusal of its governor, Sir John Hotham, to give it up at that time to Charles I., or even to admit his majesty within the gates, is a conspicuous incident in English history. For some years, owing to various circumstances, some branches of the commerce of the port have experienced a decline rather than an advance; but it is still a town of large trade. In 1829, 579 vessels, of 72,248 aggregate tonnage, belonged to Hull. For the accommodation of the shipping there is a splendid range of docks, presenting an amount of quayage said to measure 60,000 square yards, and with all the suitable accommodations for storing a vast quantity of merchandise. The population of the town is about 50,000.

Chester is one of the less important and less populous of the commercial towns of England. Such importance, however, as it possesses as a commercial town, is enhanced by its being a county town and cathedral city, and the residence of a considerable number of persons in independent circumstances. It is also remarkable for its antiquity and its historical associations, as well as for some local features of an unusual kind.

It is situated within a bend of the Dee, a few miles from the point where that river joins an estuary branching from the Irish Channel. The two principal streets cross each other at right angles, and the town is still surrounded by the massive walls which were originally designed to protect it from warlike aggression, but are now only useful as an agreeable promenade, from which some pleasant views of the surrounding country may be obtained. The streets are formed in hollows dug out of rock, so that the lowest floor of each house is under the level of the ground behind, though looking out upon the carriage-way in front. The paths for passengers are not here, as is usually the case, formed in lateral lines along the streets, but in a piazza running along the front of what in England is called the *first*, and in Scotland more correctly the *second* floor, of the houses. These piazzas, called in Chester *the Rows*, are accessible from the street by stairs at convenient distances. There are numerous shops entered from them, and they in some places still retain the massive wooden balustrades with which all were originally furnished, but for which, in other places, light iron railings have been substituted. Where the houses and balustrades are old, the effect is very curious and striking, and apt to awaken ideas of ancient usages and habits long passed away. The Cathedral of Chester contains some curious ancient architecture. The Castle is a splendid modern building, on the site of the powerful fortress which was once of such importance as a check upon the Welsh: it contains the county court-house, jail, &c. The principal other buildings are the Halls built by the merchants to serve as marts, of which there are three, besides the Exchange. The bridge across the Dee is a remarkable object, being of one arch, with a span of 200 feet: it cost £40,000.

Chester was an important station of the Romans, from whom it derived the cross form of its two principal streets, and of whom many relics have from time to time been dug up. It retained its importance during Saxon and Norman times, and in the thirteenth and fourteenth centuries was a flourishing city, with a large maritime trade. It then declined, in consequence of natural obstructions to the navigation of the river. From the year 1328 downwards, it was remarkable for the annual performance of a peculiar class of theatrical

representations, similar to those performed at Coventry, and termed Mysteries. To modern taste these would seem the most gross burlesque of sacred subjects; but so convinced were the clergy of those days of their edifying qualities, that a thousand days of pardon from the Pope, and forty from the Bishop of Chester, were granted to all who attended them. After a long period of declension, the trade of Chester was revived by the cutting of a new channel for the river, whereby vessels of 600 tons burden were enabled to come to the quays near the town. The commerce, with the exception of a few ships which visit Spain, Portugal, the Mediterranean, and the Baltic, is chiefly confined to Ireland, whence an immense quantity of linen, hemp, flax, skins, and provisions, is imported. The exports of Chester are cheese (the staple production of the county), lead, coal, calamine, copper-plates, and cast-iron. Shipbuilding is carried on to a considerable extent, and there are some manufactures of inferior consequence. The population of Chester in 1831 was 21,363.

Southampton is an ancient but considerably modernised town, the capital of Hampshire, and, next to Portsmouth and Plymouth, may be considered the chief outport on the south coast. It enjoys a situation at once pleasant and convenient, in a vale adjoining to the bay bearing its own name. In modern times, the town has been greatly improved and increased by the erection of lines of handsome streets in the environs, the residence of a respectable and leisurely population. Among the attractions of the neighbourhood, are those of the New Forest, which almost adjoins the town, and a beach forming a pleasant bathing-place in summer: few sea-side towns are more salubrious or agreeable. With the Isle of Wight, at a few miles' distance, there is a constant communication by steamboats. The South-Western Railway, which terminates near the shore of the bay, has greatly advanced the interests of the town, by making it a depôt of traffic in connexion with the metropolis; and there are now constructing, at a great cost, large wet-docks and wharfs for shipping. A considerable trade is already carried on with foreign countries, and the port is a main point of communication between England and Guernsey, Jersey, and Havre, in which, and some other respects, it is a rising rival of the neighbouring town of Portsmouth. The population in 1831 was 19,324.

University Cities.

Oxford, the chief of this limited class of cities, is the principal town in Oxfordshire, and is situated in a valley at the confluence of the Isis and Cherwell, at the distance of 58 miles from London. Besides being the seat of the celebrated university named from it, it is the seat of an episcopal see. Containing twenty colleges and five "halls," a cathedral, and thirteen elegant parish churches, besides the Radcliffe Library, the University Theatre, and several other elegant public buildings, all condensed into a small space, amidst streets, some of which are straight and elegant, while none except a few of an obscure character are mean, Oxford appears to a stranger as beautiful externally as its historic character renders it venerable. The High Street, in which several colleges are situated, is generally acknowledged to be one of the finest streets in the world. The origin of the university is usually attributed, but upon no certain authority, to King Alfred. Oxford has certainly, however, been a famed seat of learning since the twelfth century. Each college and hall has its own students and teachers, revenues and regulations; yet they are all united under the government of one university. The officers by whom the university is immediately governed, are the chancellor, high steward, vice-chancellor, and two proctors. In addition to the private officers in each college and hall, who see that due order and discipline are preserved, and all the liberal sciences taught, there are twenty-three public professors of the several arts and sciences. In 1829, there were 5009 members on the books, one-third of whom, in their capacities as fellows, &c., were maint[illegible] d the revenues. The[illegible] wear a peculiar [illegible] ried according to the[illegible] in the college. [illegible] live within the gate[illegible] their respective e[illegible]

Cambridge is the [illegible] town in Cambridgesh[illegible] is situated on t[illegible] C[illegible], [illegible] the distance of 5[illegible] mi[illegible] London. It is also an elegant city, though less Oxford. The university has no certain date 1229: it comprehends seventeen colleges, v[illegible] most respects are similar to those of Oxford. College Chapel, built in the reign of Henry VI. [illegible]sid[illegible]red the most beautiful structure in either of [illegible]versity towns.

Naval Stations.

Portsmouth, the principal rendezvous of the navy, is situated on the west side of the Isle of [illegible] in Hampshire. To the west of the island is [illegible] called Portsmouth Harbour, excelling every [illegible] the coast of England for its spaciousness, de[illegible] security. The obvious utility of this harbour [illegible] a situation, caused it to be used at an early per[illegible] st[illegible]ion for shipping, and hence the rise of the P[illegible]rtsmouth on the narrow inlet by which it co[illegible] cates with the English Channel. It is also t[illegible] red, that the strait between the mouth of t[illegible] [illegible]r and the Isle of Wight, forms the celebrat[illegible] st[illegible]d of Spithead, which is capable of contai[illegible] th[illegible]nsand sail at anchor in the greatest security original or old town of Portsmouth, surroun[illegible] ancient walls; the modern suburban towns of [illegible] and Southsea, respectively situated to the nor[illegible] south of the original town; and the town of Gos[illegible] the opposite side of the inlet to the harbour, ma[illegible] said to form one cluster of population, probab[illegible] bering not less than 70,000. The beach opposite[illegible] sea being well adapted for sea-bathing, has enab[illegible] suburb or village to become a watering-place [illegible] note.

The docks, arsenal, building-yards, and all the other establishments concerned in the fitting out [illegible] keeping of the national shipping, render Portsm[illegible] object of wonder to all who see it for the firs[illegible] The Dockyard includes the great area of 10[illegible] The Smithery is a vast building, where anch[illegible] wrought, weighing from 70 to 90 hundredweigh[illegible] On the Anchor-Wharf hundreds of these useful[illegible] ments are piled up, ready for immediate service[illegible] Ropery, where the cordage for the vessels is pr[illegible] is three storeys high, 54 feet broad, and 1[illegible] long. The Gun-Wharf is an immense arsenal, [illegible] ing of various ranges of buildings for the rece[illegible] naval and military stores, artillery, &c. The[illegible] Armoury is capable of containing 25,000 stand [illegible] There is a naval college, where a hundred sch[illegible] time of war, and seventy in time of peace, are [illegible] thirty, who are the children of officers, being[illegible] tained and educated at the public expense. [illegible] war, the number of persons employed in the [illegible] establishments connected with the public ser[illegible] Portsmouth, has amounted to 5000. The p[illegible] buildings connected with the arsenal and dockya[illegible] the commissioner's house, the government hou[illegible] victualling office, the port-admiral's house, s[illegible] naval and military barracks. The promenad[illegible] the fortifications forms one of the most agreea[illegible] tures of the town. Amongst objects of curio[illegible] may specify the Victory, Nelson's flag-ship at Tra[illegible] the Semapore Telegraph; and the house (No. 11[illegible] Street) in which the Duke of Buckingham was [illegible] rarily residing, when, in front of it, he was sta[illegible] death by Lieutenant Felton, in 1628. The chu[illegible] Portsmouth is a spacious Gothic structure, [illegible] comparatively modern tower, useful as a landm[illegible] seamen. There are various charitable, literar[illegible] scientific institutions connected with the town.

Plymouth is another important naval station, being a thriving commercial town. It is situ[illegible] the head of the capacious haven of Plymouth

...mouth, on the east side of a tongue of land ...d by the estuaries of the rivers Plym and Tamar, ...here empty themselves into the sea. Immediately ...cted with Plymouth is *Devonport*, situated in the ...diate neighbourhood, and properly an appendage ...mouth, though of late years distinguished by a ...te name. Among ...charitable institutions, which *are about thirty*, are ...thouse, *a public dispensary, an eye-infirmary*, a ...ring-in charity, a public subscription school, alms-houses, Bible societies, &c.

Towns of Residence and Recreation.

Bath.—This is reckoned the best built town in England, and is a favourite residence of the higher classes, either for recreation or in pursuit of health. It is situated in Somersetshire, at the distance of about 106 miles west from London, and lies in a valley divided by the River Avon. Though of great antiquity, the place came into notice and rose to importance in comparatively modern times, in consequence of possessing certain hot mineral springs, considered to be efficacious in the cure of different complaints. The water issues from the ground at a temperature of from 102° to 117° of Fahrenheit, and the quantity discharged daily from the various outlets is 184,320 gallons. The water has been analysed, and is found to contain sulphate of lime, with considerably lesser proportions of muriate of soda, sulphate of soda, carbonic acid, and carbonate of lime, also a minute portion of silica and oxide of iron. It is stimulating in its properties, and is said to be most successful in cases of palsy, rheumatism, gout, and cutaneous diseases. Over the springs there are elegant pump-rooms and baths. The modern parts of the town are built as streets, crescents, and squares, the houses being of polished sandstone, and in some instances constructed with much taste. Living is expensive in the town during the fashionable season. The population in 1831 was 38,063.

Cheltenham competes with Bath as a fashionable resort for valetudinarians, real or imaginary. It is situated in Gloucestershire, 88 miles west from London, and 39¼ north-east of Bath. The situation is exceedingly delightful, being remarkably well sheltered by the range of Cotswold Hills on the north-east, and having an exposure to the south and west; it is on this account preferred to all other towns in England by persons from India and other hot climates. Besides being attractive from the salubrity and mildness of its climate, Cheltenham, like Bath, possesses mineral springs reckoned of value for medical purposes, but particularly for invalids with diseased livers. There are several springs, some of which are chalybeate, but their properties and strength are liable to variation. Cheltenham is laid out, in a very ornamental manner, with walks and pleasure-grounds, and may be described as perhaps the prettiest town of a small size in England. As in Bath, the expense of living is very great. The population of the parish in 1831 was 22,942, about one-half of whom belonged to the town.

Brighton, on the coast of Sussex, has risen into importance within the last sixty years, partly in consequence of a beach remarkably well adapted for sea-bathing, and partly from its attracting the regard of George Prince of Wales, who reared a marine palace here, in a Chinese style. The population in 1831 was 40,634. Brighton is an elegant and airy town, with much to render it agreeable as a place of residence for persons in affluent circumstances. The Steyne, a spacious and beautiful lawn, nearly surrounded by houses, the Marine Parade, and several terraces overlooking the sea, furnish delightful walks; while the Baths, Theatre, Assembly-Rooms, &c., form additional attractions. There is a regular intercourse with Dieppe by steam-vessels. The Chain-Pier is a remarkable object: it was erected in 1823 at an expense of £30,000, and is 1134 feet long.

Amongst other towns of this class, we can only notice *Herne Bay*, *Margate*, and *Ramsgate*, situated on the coast of Kent, and which may be considered as the chief places of summer recreation for the inhabitants of London, to and from which steamers ply daily. Herne Bay is a place of recent date, rising into notice, and possessing a pleasant open beach, with space for promenading. Margate is a town of a much earlier date, situated in an open part of a bold line of chalky cliffs, and consists of a confused cluster of streets, with some lines of building of a more airy description in the ea-

virons. The town is well supplied with shops, bazaars, and places of amusement during the bathing-season; it also possesses numerous respectable boarding-houses, where, on moderate terms, a person may [illegible] for a short time in a very agreeable manner. A[illegible] parties of pleasure are made up for the [illegible] expense of cars and refreshments during [illegible] being defrayed by general contribution. [illegible] or two along the coast is another summer retreat called *Broadstairs;* and beyond it, at an equal distance, is Ramsgate. The chalk cliffs here, which are bold and precipitous, afford a high and salubrious position for the chief part of the town, and beneath there is a fine tract of sandy beach for the use of bathers. The harbour at Ramsgate is one of the best in England, and affords shelter to all kinds of vessels in the Downs.

Cathedral Towns.

Of this class of towns, besides those which have been already noticed under other heads, we can here only advert to three of more than usual importance.

Canterbury, the capital of Kent, is a city of great antiquity, having formed the seat of an ecclesiastical establishment to St Augustine, the apostle of Christianity to Britain in the sixth century. In the tenth and eleventh centuries, the town derived great importance from the erection or extension of a cathedral, on a most extensive scale, and of the purest Gothic architecture. In 1162, the archiepiscopal see was bestowed on the famous Becket, who enjoyed it eight years, till the period of his murder in 1170, when his shrine became an object of extraordinary reverence, and brought pilgrims in thousands from all parts of the kingdom. The cathedral, which thus became celebrated, [illegible] exists, in a slightly altered and improved condition. [illegible] form is that of a cross, with a central tower of unrivalled workmanship, reaching to a height of 236 feet. The size of the building is immense: the length inside, from east to west, being 514 feet; height of the vaulted roof, 80 feet; breadth of the nave and side aisles, 71 feet; and breadth of the cross aisles, from north to south, 124 feet. The interior exhibits a number of interesting monuments of distinguished individuals. Altogether, the cathedral is a work of exceeding grandeur, and, with exquisite beauty of form, possesses a profound historical interest. The town of Canterbury is old, and, like most cathedral towns, is a dull and formal place of residence, with a proportion of genteel inhabitants. It is, however, neat and clean, and is surrounded by a fertile and pleasant tract of country. It has a number of large hotels and posting-houses, to accommodate the numerous travellers passing between the metropolis and Dover, the chief out-port for France. The distance from London is 56 miles, and from Dover 16. A railway which is now preparing between London and Dover, and which does not touch Canterbury, will, in all likelihood, completely ruin it as a posting-station. The only object of attraction in the town, besides the cathedral, is a pleasure-ground called the Danejohn, a corruption of the word donjon, such a building having once occupied the spot, in connexion with the city walls. The area of the field is laid out with an avenue of trees, and is principally otherwise a grassy esplanade, open freely to all the inhabitants. In 1790, the field was presented by Mr Alderman James Simmonds for the use and recreation of the inhabitants in all time coming, an act of generosity deserving the highest commendation. The population of Canterbury in 1831 was 14,463.

York.—This ancient city, considered as the second in the kingdom in dignity—the chief town of the county, and the cathedral city of the archiepiscopal diocese bearing its name—is situated at the confluence of the Rivers Foss and Ouse, in one of the richest and most extensive plains in England. Its population in 1831 was 25,359. York, whatever its first rise might be, was a city of the Romans, and occupied by Roman citizens as a *colony*. It was successively the seat of Adrian, Severus, and other emperors: Severus died here in [illegible] year 210, [illegible] quest, [illegible] a [illegible] size. [illegible] but l[illegible] [illegible] [illegible] [

CATIONAL COURSE, &c.

VED SERIES. PRICE 1½d.

ON:

O THE BRITISH METROPOLIS

of which are very small in size, but at one time were very populous. The practice of living out of town, and of using the dwellings of the city for warehouses, has greatly lessened the population in latter times. Without the walls, there are eleven parishes, independently of the parishes in Westminster and Southwark. The largest and most populous of the suburban parishes is Marylebone. Adjoining the suburban though really town parishes, there are various country parishes, as Greenwich, Deptford, Camberwell, Clapham, Westham and Stratford, Hammersmith, Hampstead, &c., containing an aggregate population of 129,480; and adding this number to the above 1,474,069, there was within a compass of about eight miles round London, in 1831, a population of 1,504,042, which is probably now increased to nearly two millions. Within the last fifty years, London has doubled in extent, and at present is rapidly increasing on all sides, particularly on the north, west, and south. In no town in Great Britain are there to be seen so few empty houses. The total assessed rental of the metropolis in 1830 was £5,143,340, but the real rental was supposed not to be less than 7,000,000.

The increase of London to its present enormous size, has been promoted by certain highly favourable circumstances. First, it has for ages been the capital of England, and seat of the legislature and court; and, since the union with Scotland and Ireland, it has become a centre also for these parts of the United Kingdom. Being therefore a point of attraction for the nobility, landed gentry, and other families of opulence from all quarters, a vast increase of population to minister to the tastes and wants of these classes has been the result. While deriving immense advantages from this centralising principle, London has been equally, if not far more indebted to its excellent situation on the banks of a great navigable river, and in a fine part of the country. As already mentioned, London proper, or the greater part of the town, stands on the left bank of the Thames, on ground rising very gently towards the north; and so even and regular in outline, that among the streets, with few exceptions, the ground is almost flat. On the south bank of the river, the ground is quite level, rather too much so; and on all sides the country appears very little diversified with hills, or any thing to interrupt the extension of the buildings. The Thames, that great source of wealth to the metropolis, is an object which generally excites a lively interest among strangers. It is a placid majestic stream, rising in the interior of the country at the distance of 138 miles above London, and entering the sea on the east coast about sixty miles below it. It comes flowing between low, fertile, and village-clad banks,

out of a richly ornamented country on the west, and arriving at the outmost houses of the metropolis, a short way above Westminster Abbey, it pursues a winding course between banks thickly clad with dwelling-houses, warehouses, manufactories, and wharfs, for a space of eight or nine miles, its breadth being here from a third to a quarter of a mile. The tides affect it for fifteen or sixteen miles above the city; but the salt water comes no farther than Gravesend, or thirty miles below it. However, such is the volume and depth of water, that vessels of seven or eight hundred tons reach the city on its eastern quarter at Wapping. Most unfortunately, the beauty of this noble stream is much hid from the spectator, there being no quays or promenades along its banks. With the exception of the summit of St Paul's, the only good points for viewing the river are the bridges, which cross it at convenient distances, and by their length convey an accurate idea of the breadth of the channel. During fine weather, the river is covered with numerous barges or boats of fanciful and light fabric, suitable for quick rowing; and by means of these pleasant conveyances, as well as small steam-boats, the Thames forms one of the chief thoroughfares.

London is fortunate in a particularly salubrious situation, whether as respects its relation to the river or its subsoil. A large portion of the entire city is built on gravel, or on a species of clay resting on sand; and by means of capacious underground sewers in all directions, emptying themselves into the Thames, the whole town (with some discreditable exceptions in the humbler and more remote class of streets) is well drained and cleared from superficial impurities. On account of the want of stone here, as in many other places in England, brick is the only material employed in building. London is therefore a *brick-built town.* To a stranger, it appears to consist of an interminable series of streets of moderate width, composed of dingy red brick houses, which are commonly four storeys in height, and seldom less than three. The greater proportion of the dwellings are small. They are mere slips of buildings, containing, in most instances, only two small rooms on the floor, one behind the other, often with a wide door of communication between, and a wooden stair, with balustrades, from bottom to top of the house. It is only in the more fashionable districts of the town that the houses have sunk areas with railings; in all the business parts, they stand close upon the pavements, so that trade may be conducted with the utmost facility and convenience. Every street possesses a smooth flagged pavement at the sides for foot passengers; while the central parts of the thoroughfares are causewayed with square hard stones, or paved in some other way equally suited to endure the prodigious tear and wear created by the horses and vehicles passing along them.

In the central and many other principal streets of London, the ground storeys of the houses are generally used as shops or warehouses. When the object is retail traffic, the whole range of front is usually formed into door and window, so as to show goods to the best advantage to the passengers. The exhibition of goods in the London shop windows is one of the greatest wonders of the place. Every thing which the appetite can desire, or the fancy imagine, would appear there to be congregated. In every other city there is an evident meagreness in the quantity and assortments; but here there is the most remarkable abundance, and that not in isolated spots, but along the sides of thoroughfares miles in length. In whatever way the eye is turned, this extraordinary amount of mercantile wealth is strikingly observable; even in what appear obscure alleys or courts, the abundance of goods is found to be on a greater scale than in any provincial town.

The flowing of the Thames from west to east through the metropolis, has given a general direction to the lines of streets; the principal thoroughfares are in some measure parallel to the river, with the inferior, or at least shorter, streets branching from them. I ing the town lengthwise, or from east to west, great leading thoroughfares at a short distar each other, but gradually diverging at their extremity. One of these routes begins in the environs, near Blackwall, proceeds along Whi Leadenhall Street, Cornhill, Cheapside, Newgat Skinner Street, Holborn, and Oxford Street. T may be considered as starting at London Bri passing up King William Street into Cheapsid end of which it makes a bend round St Paul's yard, thence proceeds down Ludgate Hill, alo Street and the Strand to Charing Cross, where a branch off to the left to Whitehall, and an the right, called Cockspur Street, which leads into Pall-Mall, and sends a shoot up Reger into Piccadilly, which proceeds westward to Hy Corner. These are the main lines in the me and are among the first traversed by strangers be observed that the main channels unite in Cl which therefore becomes an excessively crow roughfare, particularly in the early part of The main cross branches in the metropolis a ringdon Street, leading from the opening t friars Bridge, at the foot of Ludgate Hill, to I the Haymarket, leading from Cockspur Str Regent Street, already mentioned. There ar large streets leading northwards from the Holl Oxford Street line. The principal one, in th St Martin le Grand and Aldersgate Street, wh municates with the great north road. It is a r general complaint, that there are so few great of communication through London both length crosswise; for the inferior streets, independ their complex bearings, are much too narrow lar traffic. According to the accounts last ta entire metropolis contained 13,936 separate squares, courts, alleys, &c., each with a distin Oxford Street, the longest in London, is 2304 length, and numbers 225 houses on each side.

Without particular reference to municipal tions, London may be divided into four princi tions—the city, which is the centre, and wh greatest part of the business is conducted; end, in which is the port for shipping; the w or Westminster, in which are the palaces of th and royal family, the houses of Parliament minster Abbey, and the residences of the nobi gentry; the Surrey division, lying on the sou of the Thames, and containing many manuf establishments and dwellings of private familie sides these, the northern suburbs, which incl once detached villages of Stoke Newington, I Hoxton, St Pancras, Pentonville, Somer's To Paddington, and consist chiefly of private dwell the mercantile and higher classes, may be con a peculiar and distinct division. It is, howe where possible to say exactly where any one begins or ends. Throughout the vast compas city and suburbs, there is a blending of one with those contiguous to it. In the busines there are lines or clusters of neat dwellings, the parts devoted to retirement there are seen tions of business. The outskirts on all sides c long rows or groups of detached villas, with mental flower-plots; and houses of this attracti proceed in some directions so far out of tow there seems no getting beyond them into the From the Surrey division there extend southwa westwards a great number of these streets private houses, as, for instance, towards Wa Kennington, Clapham, Brixton, &c.; and in thes tions lie some of the most pleasant spots in the c of the metropolis. The suburban streets a macadamised, and possess gravel side paths.

PLACES ON THE THAMES, BELOW LONDON.

The places on the Thames, below London, wh most worthy of the visits of strangers, are D

wich, and Woolwich, the latter being the farthest
own.

Deptford is a village in Kent, on the south bank of
Thames, eight miles from London by land, and ten
ong the course of the river. Here, in the reign
enry VIII., a dockyard for the construction of
ips of the royal navy was established; and, ever
e this place has been distinguished as an arsenal for
ival and military stores. From the river a view is
ained of the dockyard and arsenal, now greatly im-
ed. The ground, for nearly a mile in length, is
ded by a stone quay, and surrounded on the land
e with various storehouses and workshops. Among
e is included a laboratory for the preparation of
ets, bombs, grenades, and shot. Adjoining are
rks for artillery and marines, military hospitals,
d the upper part of Woolwich Common is situated
e military academy for the education of young
ntlemen designed for the army. Strangers are not
mitted to the dockyard and arsenal without an order
m either of the Board of Ordnance. About two
les farther up the Thames, at the head of the reach,
Woolwich, on the north bank, with its noble quay for
ge ships. The river now bends sharply to the south,
d then returning northwards, encloses like a penin-
la on the north side, a large flat piece of marshy
nd called the *Isle of Dogs*. At the southern extre-
ity of this bend of the river stands Greenwich.

Greenwich is a small town, lying on the south bank
the Thames, about six miles below London Bridge,
llowing the windings of the river, but only about four
iles by land. To those who do not reach it from
Deptford or any other part down the river, but pro-
ed to it on purpose from London, the most conve-
ient route is by railway from the terminus near the
orthern end of London Bridge, the journey being per-
rmed in fifteen or twenty minutes. Small steamers
so ply to it from the north end of the bridge every
alf hour. As a town, Greenwich is of no moment; its
ospital and parks are the only objects of attraction to
rangers. As you enter its streets, you perceive that it
s a seafaring look, and does not resemble the
ther places of population in the environs of the capi-
al. Towards its eastern extremity stands the hospital,
ronting the Thames, and has a perfect command of
e passages on the river. This superb hospital con-
ists of four edifices, unconnected with each other, but
erally forming an entire structure, lining three
des of an open square, that side on which there is no
uilding being next the water. The whole is built of
one, in the best possible style; and along nearly
e entire part are lofty colonnades, with handsome
ofs and covered overhead, to protect those under-
eath from the weather. The square interval in the
ntre, which is 273 feet wide, is paved also with smooth
one, and ornamented in the middle with a statue of
eorge II., by Rysbrach. Beyond the edifices, on the
ast, rises the splendid park of Greenwich, dotted with
ne tall trees, and crowned at the top with the
oyal Observatory buildings.

The portion of these beautiful buildings was originally
uilt in the reign of Queen Elizabeth, since whose time various
ther edifices and additions have been made, but chiefly
uring the reign of William and Mary, who, in the year
689, established an hospital for invalid seamen,
hich purpose the buildings are still exclusively de-
oted. By the last accounts it contains 2710 pensioners,
ho, with a variety of officers for the government
f the house; and gives support to 32,000 out-pension-
rs. The institution is supported by a payment of six-
ence per month from every sailor in the royal navy,
ertain dues and donations, and other means. The
umber of individuals who reside within the walls is
bout 3300. The inmates have a strikingly antique air.
hey are all old sailors, with countenances well browned
y local suns, and bleached by the tempests of the
ea; some hobbling on a wooden leg, others with an
mpty sleeve, a few with only one eye. Their clothes
re of a dark blue colour, of an antiquated fashion.
A number wear cocked hats, which add greatly to their
supposed antiquity; the boatswains, or other warrant
officers, are allowed a yellow trimming or lace to their
garments.

There is an air of much contentment, comfort, and
peacefulness, in this well-regulated establishment. An
abundance of food is allowed, the clothing is warm and
comfortable, the accommodations in the house are good,
and each man, according to his rank, has from a shil-
ling to half-a-crown a-week, as an allowance for pocket-
money. The outer gateway, and the interior parts of
this establishment, are under the care of the pensioners
themselves, who show the utmost attention to strangers,
manifesting a politeness and good nature characteristic
of the profession of the sailor. Small sums are taken
for exhibiting the different places worth seeing, but the
money goes to the general fund, or for the board and
education of the children of seamen; and the amount
tendered by visitors is instantly transferred to the box
for its reception.

The chief *lion* of the establishment is the painted
hall, which is in the west wing. It consists of a great
room and one smaller but equally lofty, leading from its
upper end by a flight of steps. A vestibule and flight
of steps are between the outer doorway and large
room. The appearance of the whole interior on en-
tering is very imposing, the high roof being covered
with paintings, as also the farther extremity fronting
the entrance; and although these paintings, from ex-
hibiting a mixture of fantastic heathen gods and god-
desses with royal and other portraits, are not individ-
ually in good taste or of any value, they serve to give
a good general effect to the noble apartments they
adorn. Along the walls are hung a collection of pic-
tures, partly portraits of celebrated navigators and
admirals, and partly depicting distinguished naval vic-
tories, each being a present to the institution by some
benefactor. A good portrait of Captain Cook, by Dance,
presented by Sir Joseph Banks, adorns the vestibule.
A number of portraits, by Sir Peter Lely, Dahl, Sir
Godfrey Kneller, and others, have been presented by
George IV. There are also several by Sir Joshua
Reynolds. A little garrulous old sailor, with a single
sparkling eye, and a wonderful warmth of devotion to
the excellences of the institution, points out the beau-
ties of the various artists, and descants on the extra-
ordinary deception in the perspective of the figures,
which he again and again assures the beholder do not
stand out from the walls or from the plaster, but are
quite flat, and "all as smooth as glass." The painted
ceiling of the great room was executed by Sir James
Thornhill in 1703, and several subsequent years: from
a miscalculation as to the time required for the work,
the remuneration fell far short of what it ought to have
been. It is related that, in consequence of the length
of time he had to lie on his back painting the ceiling,
the artist could never afterwards sit upright. In the
smaller apartment are shown several models of ships
of war, admirably executed in wood; the coat worn by
Nelson at the battle of the Nile; and the astrolabe of
Sir Francis Drake, a curious brass instrument of an-
tique fashion, used for nautical observation. It has been
computed that nearly fifty thousand persons annually
visit this magnificent suite of apartments, in which the
excellent taste and judgment of the distinguished ar-
chitect, Sir Christopher Wren, are displayed not only
by their just proportion and embellishment, but in that
studious regard to picturesque form and outline which
he has bestowed in all his designs.

The park extending behind the hospital—ever open
to the public—comprehends a considerable space of
ground, of great natural and artificial beauty. A path-
way amidst lines of tall trees leads to a piece of rising
ground or mount—quite a hill to a Londoner—which,
on holidays, generally exhibits a mirthful scene, lads
and lasses of the humbler classes considering it as a
feat to run down the slope without falling or making a
stop. On the summit is the Royal Observatory, founded
by George III. for the promotion of astronomical

science, and the scene of the labours of some men of distinguished ability. An astronomer-royal, supported by the bounty of the crown, constantly resides and pursues investigations in the Observatory. It is scarcely necessary to remind the reader that, from this spot, British geographers measure the longitude in their maps and charts.

Greenwich Observatory.

Deptford adjoins Greenwich on the west, being only separated from it by a muddy river called Ravensbourne, the mouth of which forms an estuary known as Deptford Creek. Like Woolwich, this place is celebrated for its royal dockyard, commenced also in the reign of Henry VIII. The dockyard, with the victualling department and offices, covers above thirty acres. While Woolwich is now devoted to the preparation and custody of naval and military stores, Deptford is chiefly used for the building of ships; and it possesses wet and dry docks, mast houses, smiths' shops, with about twenty forges for making anchors. From 1000 to 1500 men are usually employed here. The principal depôt, however, for large vessels of war laid up in ordinary, is at Sheerness, near the mouth of the Thames. Peter the Great of Russia, in 1698, studied the art of ship-building at Deptford. In the Thames, near Deptford, may be seen moored the hull of a ninety-eight gun ship, called the Dreadnought, which was dedicated by George III. as a seaman's hospital, and, as is indicated by the inscription on its side, it is open to the reception of sick or disabled seamen of any nation. This noble charity is supported by voluntary contributions.

We now proceed to notice the chief public buildings and objects and places of attraction in and about London, beginning with the Port and places of importance on the Middlesex side of the river.

PUBLIC BUILDINGS, &c., IN LONDON.

The Port.—That part of the river between London Bridge and Blackwall, an interval of several miles, but more particularly the part immediately below the bridge, constitutes the Port, and here are constantly seen lying at anchor great numbers of vessels. As a relief to the river, and for other reasons, there are several very large docks; the lower, and most important, being the East India Docks, which consist of two spacious basins. The next are the West India Docks, the entrances to which are at Blackwall: in these large depôts of shipping connected with the West India trade may at all times be seen some hundreds of vessels, loading or unloading in connexion with the warehouses around. The largest of these docks contains thirty acres of water, and is twenty-four feet deep. Farther up the river, and near the Tower, in the district called Wapping, are the London Docks and St Katharine's Docks. The London Docks consist of one grand enclosure to the extent of twenty acres, and another of smaller dimensions. These are surrounded by warehouses for the reception of bonded goods, and beneath the warehouses are vaults for bonded liquor. The principal warehouse, entirely devoted to the k tobacco in bond, till it is purchased and the d paid, is situated close beside a dock of abov in extent, called the Tobacco Dock. The Tobac house is the largest covered building in the occupies no less than five acres of ground, ar commodation for 24,000 hogsheads of toba sight of this extraordinary warehouse, an wine vaults, is calculated to convey the most cent conceptions of British commerce. The arched with brick, and extend in one direc continuous line about a mile in length, with lines also of great length, the whole being streets of a town under ground. Along the ranged pipes of wine to an amount apparentl limit. There is accommodation for 65,000 pip cellars being dark, all who enter and go thro carry lights. Admission may be had by pro order from a wine-merchant to taste and exa pipes he may have in bond: a cooper accomp visiter to pierce the casks. Besides this la which principally contains port, there are otl for French wines, &c. The various docks ar perty of joint-stock companies, who receive dues of various kinds for their use. At the s river adjacent to St Katharine's Docks, lie lar vessels, which sail to and from Edinburgh distant ports. Passing the Tower, there is a c series of wharfs for shipping and steam-v about a mile to London Bridge, the traffic of being here most dense, and the river at being called the Pool. In this chosen seat merce, and at a short distance from the bri upon the river, is situated the *Customhouse*, an immensely large stone building, which wa 1814, on the spot occupied by a former cus destroyed by fire. The north front, in whi entrance, is towards a narrow and dirty al Lower Thames Street. There is nothing wo ment's notice in or about the building, exce long room, in which the chief part of the b transacted; it measures 190 feet long, 66 f and 55 feet high. The number of clerks, searc other officers of the establishment, is about sand. At wharfs between the Customhouse bridge, lie those numerous steam-vessels whi Gravesend, Margate, and other places of res the Thames, also steamers for continental po don, as has been observed, possesses no line of the river. The trade with the ships is carr wharfs jutting upon the water. The Thames under strict police regulations with respect certain places are assigned to different class sels, including those which arrive from Newc coal, and all coasters. The number of shi arrived from foreign ports in 1837 was 562 a burden of 1,051,923 tons; and the number of including Irish vessels, which arrived the sa was 21,322, with a burden of 2,911,756 t customs duty collected at the Port in 1834, am the enormous sum of £9,576,972. Of the a imports by canals, railways, and roads, there c just estimate.

The trade connected with the Port is carr the closely constructed part of the town adjac Thames, and backwards to the centre of the c most the whole of this district consists of narro environed by warehouses and offices, making nal show, but in which an incalculable amoun is going on. The offices of many bankers, shi insurance companies, are situated hereabout site this quarter, on the Surrey side of the equally dense masses, are numerous shippin warehouses, porter breweries, and manufacto

The Tower.—The Tower of London, which of the principal sights of the metropolis, is a houses, towers, and prison-like edifices, situ low and obscure locality, on the north ban Thames, and separated from the crowded

of the city by an open space of ground called ...hill. The Tower was founded by William the ...ror, to secure his authority over the inhabitants ...don; but the original fort which he established ... spot was greatly extended by subsequent mo... ; and in the twelfth century it was surrounded ...eat ditch, which was improved, as it is now seen, ... reign of Charles II. Within the outer wall the ...d measures upwards of twelve acres. Next the ...there is a broad quay, and on this side also there ...channel by which boats may pass into the main ...of the place. This water entrance is known by ...me of Traitor's Gate, being that by which state... ...ers are conveyed out in boats to proceed for trial ...minster. The interior of the Tower is an irre... ...assemblage of short streets and court-yards, with ...ks, houses of keepers, &c. The chief buildings ...the White Tower for prisoners, an ancient chapel, ...dexance-Office, the Record-Office, the Jewel-Office, ...rse Armoury, the Grand Storehouse, and the ... Armoury. Strangers, on applying at an office at ...trance from Tower-hill, are conducted through ...ublic establishments. The principal objects of ...sity are the immense store of fire-arms, sufficient ...ip 150,000 men, and beautifully arranged for ...; a collection of cannon, being trophies of war; ...ese armoury, being a most interesting collection ...ts of mail, on figures; and the crown and other ...ia of royalty. Fee for seeing the armoury, 6d.; ...gems, 2s. 6d.

Tower-hill, facing the Tower, are placed two pub... ...tablishments—the *Trinity House*, being the office ...corporation whose duty consists in superintending ...ercants of British shipping; and the *Royal Mint*, ...arge and elegant building pointed out as the Mint, ...ins the offices of clerks and other functionaries of ...stablishment. The buildings in which the coining ...performed are situated in the courts behind, and are ...ies of neat workshops, containing a large steam-... ...e, as a moving power, melting pots, and machi... ...for striking the coins. This machinery is exceed... ...interesting, and the whole is a model of exactness. ...gers can only be admitted by an order from a ...ior officer connected with the establishment.

...ames Tunnel.—With the view of effecting a ready ...unication for waggons and other carriages, and ...passengers, between the Surrey and Middlesex ... of the river, at a point where, from the constant ...ge of shipping, it would be inconvenient to rear a ..., a tunnel or free passage beneath was designed ...carried into execution by a joint-stock company, ..., however, has been largely assisted by govern... ... The tunnel, from a plan of Mr Brunel, was be... ...n 1822, at a point about two miles below London ...ge, entering on the southern shore at Rotherhithe, ...sing near the London Docks on the other. After ...ntering numerous difficulties, including several ...ations from above, the work has been brought ...ly to a close (January 1841). The tunnel consists ...o distinct avenues or arched vaults, but connected ...assages with each other; each avenue being of ...height and breadth as to afford a waggon road ...footpath. All carriages and passengers going from ... to north will take one avenue, and those going ...opposite direction will take the other. In its in... ...plete state, the tunnel is open to visitors, who de... ...d to it by a spiral stair on the Rotherhithe side. ...n completed, it will be entered by an inclined road ...ch end.

... Monument—This is a stone column situated ... small space of ground adjoining the southern ...mity of King William Street, on the descent to ...r Thames Street. It was erected (1677) in com... ...oration of the great fire of London, which began ...e distance of 202 feet eastward from the spot, in ...; and its height has on that account been made ...eet. It is a handsome fluted column, designed by ...hristopher Wren, with a gilt spherular ball on the ...it. Visitors are allowed to ascend by a stair to the top, on paying 6d. each. The fabric is now infirm, and its removal has been proposed.

Bridges.—Old London Bridge crossed the Thames a short way below the new erection, and was built in 1176, having a considerable rise in the middle, and twenty narrow arches. The new bridge, which is a remarkably fine stone structure, was designed by the late John Rennie, Esq., and opened in 1831; it consists of five arches, that in the middle being 150 feet span, and with a spacious level roadway, connected with the beautiful new thoroughfare, King William Street, at the north end, and with the main street of the Borough on the south. The old bridge was removed after the new one was built. On one of the days in August 1840, it was found, on a careful inquiry, that there passed along King William Street, from eight in the morning till eight in the evening, 11,010 carriages, or an average of 970 an hour, or 15 in every minute. On a day of September, in the same year, it was found that there passed during the same space of time, 53,503 foot passengers, averaging 74 per minute.

Southwark Bridge is the next above London Bridge. Its piers are of stone, supporting three arches of immense width; the span of the central arch is 240 feet, or the widest in the world. There are 5200 tons of iron in this bridge. It is the property of a company, who exact a toll from passengers; and from this cause, as well as from having a bad entrance, there is remarkably little traffic upon it.

Blackfriars Bridge, the next in order, was finished in 1768, and consists of nine elliptical arches; the centre one being 100 feet in span, and the entire length 995 feet; the breadth of the carriage-way is 26 feet, with 7 feet of pathway on each side. This bridge rises in the old-fashioned manner; and has been so badly constructed, as recently to require an almost entire renewal of piers; it is now much improved. It is connected with Fleet Street, at the foot of Ludgate Hill, by the intermediate thoroughfare called Bridge Street, and at its southern extremity it has the long and wide thoroughfare, Blackfriars Road. The river and St Paul's are best seen from this bridge.

Waterloo Bridge, which is the next above, crosses the river opposite the central part of the Strand. It was finished in 1817, having taken only six years to build. The design was furnished by Mr G. Dodd, and exceeds in elegance any similar work of art. It consists of nine arches, each of 120 feet span, the whole, including the parapet, built of granite. The roadway at each end is also brought to a level by secluded arches. The length of the bridge, within the abutments, is 1242 feet; width of carriage-road 28 feet, and of each side-path 7 feet. The whole being perfectly level, the bridge may be considered by far the finest in the world. Waterloo Bridge is the property of a company, who exact a toll of 1d. from each passenger; on this account, it is little used as a public thoroughfare.

Westminster Bridge, which crosses the river at a point immediately adjoining Westminster Hall, to Lambeth, is of an old-fashioned structure, with a considerable rise from both ends; it was finished in 1750; extends a length of 1223 feet; is 44 feet wide; and has thirteen large and two smaller arches, of the semicircular figure; width of middle arch, 76 feet. At the side of the pathways, and rising above the piers, there are recesses, twelve of which are partially covered with cupolas, and these prominent objects give the bridge a peculiar appearance.

Vauxhall Bridge is the most westerly in the series, and crosses the river from a point above Millbank to the thoroughfare adjoining Vauxhall Gardens and Kennington. It consists of nine cast-iron arches resting on stone piers. Standing very much aloof from the lines of general intercourse, and being the property of a company who exact a toll from passengers, it is comparatively little used. In consequence of a considerable bending in the Thames, Vauxhall, Kennington, and other places in that neighbourhood, can be reached by much shorter routes from the centre of the metro-

polis, by crossing at London or Blackfriars Bridges, than at either the bridges of Westminster or Vauxhall.

Proceeding with our description of public buildings and places of importance in the city, the first we come to in going westward, is the

India-House.—This is a large building on the south side of Leadenhall Street, erected in 1799, and containing accommodation for the home government of the East Indies. Here there is a grand court-room for the directors of the company, large sale-rooms for the disposal of tea and other goods, and offices of various kinds. The chief places of attraction in the establishment are the library and museum, both containing many objects of curiosity from the East. The principal warehouses, which are of immense extent, are in Bishopsgate Street. The museum of the India House is open only on Saturday from ten to twelve, *gratis*, all the year except September.

Corn-Exchange.—In Mark Lane, a thoroughfare going southwards from Leadenhall Street, near the India-House, is the Corn-Exchange, a large plain building, in which the greater part of the sales of corn take place. Monday is the market-day, on which the greatest bustle prevails.

Royal Exchange.—This building, erected in 1566, and consisting of a handsome quadrangular structure, situated on the north side of Cornhill, was burnt down a few years ago, and upon its site a new Exchange is in course of erection.

Bank of England.—Standing in some measure behind the site of the Royal Exchange, facing Threadneedle Street, are seen the extensive series of stone buildings containing the Bank of England. The principal front, seen from the corner of Cornhill, consists of a long line of wall, ornamented with handsome fluted pillars, cornices, and other devices; the windows being blank, the aspect is dead and not by any means pleasing. In the centre is the principal entrance, which conducts to an inner open court, and thence the main building, in which is the telling-office, is reached. Thus far the house is freely open to visiters. The whole buildings and courts include an area of about eight acres, and were completed in 1788. The telling-room shows a scene of extraordinary activity—clerks counting and weighing gold coins, porters going to and fro, and crowds of tradesmen and others negotiating business at the counters. The other and more private parts of the Bank can be seen only by an order from a director. The most interesting departments are the bullion office, in a vaulted chamber beneath, entering from a back court, the treasury, and the apartments in which the notes of the bank are printed. In this latter department there is a large steam-engine, which moves two printing machines, twelve plate presses, and other mechanism—the whole being in the most beautiful order, and forming a most interesting sight. In 1832, there were employed in the Bank, 820 clerks and porters, and 38 printers and engravers; there were besides 193 pensioners. The salaries and pensions amounted to £218,003, the house expenses to £39,187, and the allowance to directors £8000. In a spacious circular chamber, called the Rotunda, which is near the telling-office, a considerable business in the sale of government stock is negotiated. The three per cent. consols office, and dividend office, are fine large apartments adjoining. The hours at which the Bank is open are from nine in the morning till five in the afternoon, holidays excepted.

The most striking view in the interior of the city is at the open central space whence Threadneedle Street, Cornhill, King William Street, and Cheapside, radiate in different directions. While the corner of the Bank of England bounds this space on the north, it is environed on the south by the

Mansion-House.—This is a tall square mass of dark stone building, with a portico of six Corinthian columns in front, resting on a low rustic basement—the design being heavy and inelegant. This edifice, which projects a considerable length behind, is the official residence of the Lord-mayor of London ovided by the city co poration. Besides an ex suite of domestic apar ments, it contains a n state rooms, in whic company is received tained. The chief these rooms are the l all, and the ball-roo which have a grand appearance. The annual allow ance to the lord-mayor is £8000, and in the Mansion House he has the use of a superb collection of plate he is likewise allowed the use of a state coach, &c.

Cheapside.—This great central thoroughfare, which closely lined with shops of drapers and other trades men, is one of the oldest and most respectable street of the city. On each side narrow streets diverge into the dense mass behind—Ironmonger Lane, King Street, Milk Street, and Wood Street on the north and among others, Queen Street, Bow Lane, and Old 'Change on the south. The greater part of those back streets, with the lanes adjoining, are occupied by the offices or warehouses of wholesale dealers in cloths, silks, Manchester goods, articles of Scotch manufacture, paper, &c., and are resorted to by country shopkeepers for supplies. Across the bottom of King reet stands

Gu hall, or the townhall of London, where are held i of the livery to elect members of parliament, or, sheriffs, and others, and where the princi- entertainments are given. The building is old, received a new Gothic front in 1789. The interior of the grand hall is 153 feet long, 48 feet broad, and 55 feet high; it is one of the largest rooms in London, and can accommodate about 3500 persons at dinner. Two clumsy figures called Gog and Magog, interesting to vulgar curiosity, are placed at the west end of the hall. The apartment is decorated with several historical pictures and monuments. Adjoining are various offices for city courts.

Bow Church, or, more correctly, the church of St Mary-le-Bow, occupies a conspicuous situation on the south side of Cheapside, and possesses a spire of great elegance, designed by the famous architect, Sir Christopher Wren. The clock projects over the street from the lower part of the tower. Standing in the centre of the city, those who are born within the sound of its bells are jocularly called *Cockneys*, a name equivalent to genuine citizens. The consecration of the bishops of London takes place in Bow Church.

At the western extremity of Cheapside is a dense clump of building, in which is Paternoster Row; on the right or north is St Martin le Grand, a street in which is the Post-Office; and on the left is St Paul's Churchyard.

Post-Office.—This is the grandest of all the public buildings of London, not reckoning those of an ecclesiastical order. In comparison with its lofty central portico, all other columnar structures in the metropolis seem insignificant. The whole edifice is of stone, and measures 389 feet in length; and the three porticoes with which it is adorned are of the Ionic order. Beneath the central portico is the entrance to a spacious hall (80 feet long, 60 feet wide, and 53 feet high), having also an entrance at the opposite extremity; and on both sides are the various windows or wickets for receiving letters designed for the foreign, inland, or town post, &c. The upper storeys in the building contain sleeping apartments for numerous clerks belonging to the foreign post-office, and servants. The building is enclosed by a railing, and at the north end is a courtyard in which mail-coaches range up and depart with their load of bags every evening at eight o'clock. From six to seven o'clock in the evening a prodigious bustle prevails in putting letters into the Post-Office; and on Saturday evening, when the Sunday newspapers are posted, it exceeds all descri n. The spectacle afforded at that time is one of the m . resting sights of London. Immediately behind the st-Office stands Goldsmiths' Hall, a new and v al nt building of Grecian architecture, and of larg ions, but lost to view in this unhappily confined m.

St Paul's.—St Paul's C , the most prominent

London, and whose lofty dome towers in ma- r the mean rows of brick houses which environ in the centre of an enclosed churchyard of imensions, at the head of Ludgate Hill Street. ı was planted here four hundred years before nan Conquest, and, under various shapes and s, it remained till destroyed by the great fire n, in 1666. An entirely new edifice was then ı its stead, the important work being committed ristopher Wren. It is built in the form of a oss, and measures 514 feet in length, 286 in and 370 in height, to the topmost pinnacle. ly, the walls, which have a dark sooty appear- cept where bleached with the rains, exhibit a ange of windows. There are three porticoes at entrances, on the north, west, and south. That est is the principal, with twelve lofty Corinthian elow, and the angles above crowned with hand- l towers, the size of ordinary church towers or

But this entrance, which fronts the street udgate Hill, is apparently disused, and the entrance is by the north portico and flight of n entering, the impression produced by the of the internal space is very great, although entirely want those decorations which give St nd many less remarkable continental churches beauty and interest. The only objects de- ı please in detail are the statues and sepulchral nts ranged along the sides of the aisles. The ı of St Paul's are considerable, and support rebendaries and other functionaries, the insti- ing a collegiate church. Prayers are read orning and afternoon. Through some fine enwork, a view is obtained of the place where l services are performed, and which is highly l with dark oaken carved work. If the stranger ne may mount by means of stairs and ladders op of the cupola; and though he be taxed all sum at the different stages, he will be paid by the extensive view from the balcony y, which comprehends the whole of London, country beyond its outskirts, and the Thames lacidly in its winding course through the dense ouses. Altogether, St Paul's is a magnificent ; and though it cost a million and a half of ı the erection—and that was a great sum in nteenth century—the price was well spent by n on so worthy an object. The clock-work t bell of St Paul's always attract the notice of

The pendulum measures fourteen feet in hile the mass at its extremity is one hundred- The great bell, which is only rung when a mem- e royal family dies, is placed in the southern ove the western portico, and weighs four and s, and is ten feet in diameter. The fine deep his mighty bell, on which the hours are struck, lemnly in a quiet evening across the metro- l are heard distinctly by families at their fire- eral miles distant. In the immediate vicinity of , the town has a retired cloistered appearance, s of the very streets and lanes giving token of mer connexion with the religious structure erical attendants. The enclosed churchyard is led by a street, not of the broadest dimensions, emmed in with houses, now chiefly dedicated the lower storeys being, as usual, shops. An hed passage on the south side of the church- ls to Doctors' Commons, or the offices connected ecclesiastical courts. St Paul's is open each r from 9 to 11, and from 3 to 4; and on Sun- ı 10 to 12, and from 3 to 5. An authorised fees is exhibited at the door.

ester Row is a continuation of Cheapside, but is as a thoroughfare, though it communicates by se alleys or courts with the Churchyard, and, stern extremity, by means of another cross led Ave-Maria Lane, leads into Ludgate Hill. ter Row, or "the Row," as it is familiarly is a dull street, hardly wide enough to permit two carriages to pass each other, with a narrow pavement for a single rank and file on each side, and a gutter in the middle. The houses are tall and sombre in their aspect, and the shops below have a dead look, in comparison with those in the more animated streets. From a very remote period, this alley has been the seat of booksellers and publishers, who, till the present day, continue in such numbers as to leave little room for other tradesmen. At the western extremity of Paternoster Row, a passage leads from Amen Corner to Stationers' Court, in which is situated Stationers' Hall, and also several publishing houses.

Christ Church Hospital, or the *Blue Coat School*, as it is commonly called from the colour of the boys' dress, is situated within an enclosure on the north side of Newgate Street, and is one of the most splendid among the charitable foundations of London. The buildings stand on the site of a monastery of Greyfriars, which was granted by Henry VIII. to the city for the use of the poor; and his son and successor Edward VI. greatly extended the value of the gift, by signing a charter for its foundation as a charity school, and at the same time endowing it with sundry benefactions. The hospital was opened for the reception and education of boys in 1552. Charles II. added an endowment for a mathematical class, and with various augmentations of endowment, the annual revenue is, we believe, about £40,000. This income supports and educates nearly 1200 children, 500 of whom, including females, are boarded at the town of Hertford for the sake of country air. The management of the institution is vested in a body of governors, composed of the lord-mayor and aldermen, twelve common-councilmen chosen by lot, and all benefactors to the amount of £400 and upwards. The children are admitted without reference to the city privileges of parents; about one hundred and fifty are entered annually. After instruction in the elementary branches of education, the greater number leave the seminary at the age of fifteen, those only remaining longer who intend to proceed to the university, or to go to sea after completing a course of mathematics. There are seven presentations at Cambridge, and one at Oxford, open to the scholars. The buildings of the institution embrace several structures of large dimensions, chiefly ranged round open courts, with cloisters beneath, and a church, which also serves as a parochial place of worship. The only part of the establishment worth examining for its architecture or size is the great hall, occupying the first floor of a building of modern date, and in the Gothic style. It measures 187 feet long, 51 feet broad, and 47 feet high, and possesses a small gallery at each end. In this magnificent apartment, the boys breakfast, dine, and sup, under the direction of female *gouvernantes*. Before meals, one of the elder inmates, from a pulpit, says a long grace or prayer, at the commencement of which the whole of the boys, in lines at their respective tables, fall on their knees, and present a striking spectacle. Each boy is dressed in the pauper costume of Edward VI.'s reign; the garment consisting of a long dark-blue coat, breeches, and yellow worsted stockings. They are also provided with woollen caps, but these are so small and flat as to be rather for show than use.

Newgate.—At the western extremity of Newgate Street, and fronting the Old Bailey, a street which crosses to Ludgate Hill, stands Newgate, the general criminal prison for the city and county. The exterior presents high dark stone walls, without windows, and with entrances from the side next the Old Bailey, at one of which public executions take place. The earliest prison here was in the portal of the *new gate* of the city, as early as the thirteenth century, and hence the name. The present modern edifice was in course of erection in 1780, when it was partially destroyed by the riots of that year; and it has since been greatly extended, one of its improvements being the exclusion of debtors, who are now confined in a jail in Whitecross Street, and a still greater improvement being the classification of prisoners in wards. The establishment is

kept in the cleanest possible condition, and is otherwise managed with great care and humanity. The cells for condemned prisoners are at the north-east corner, next to Newgate Street. Strangers are admitted to inspect the prison by an order from one of the sheriffs or other competent city authorities. In buildings adjoining the prison are held the Central and other criminal courts. At the head of Snow Hill, and nearly opposite Newgate, stands St Sepulchre's Church, the sounding of whose bell has admonished many an unhappy wretch of the approaching hour of execution.

Temple-Bar, &c.—The boundary of the city, at the western termination of Fleet Street, is marked by Temple-Bar, consisting of a wide central archway, and a smaller archway at each side for foot passengers. There are doors in the main passage which can be shut at pleasure, but practically they are never closed except on the occasion of some state ceremonial, when the lord-mayor affects an act of grace in opening them to royalty. The structure, which was designed by Sir Christopher Wren, and erected in 1672, must now be considered as a serious obstruction to the living stream passing below. The neighbourhood of Temple-Bar, on the city side, is much occupied by offices, halls, and residences of lawyers and law-students. In or near Chancery Lane, northwards from Fleet Street, are situated Serjeant's Inn, Lincoln's Inn, Clifford's Inn, &c., while Gray's Inn and Furnival's Inn are situated on the north side of Holborn. These and other *Inns of Court*, as they are termed, are large establishments, with apartments for the residence of law-students, who, however, do not attend classes, but only rent rooms and pay for their dinners. After residing and paying at an ordinary for a certain length of time in these places, young men are considered qualified to be called to the bar. At the foot of a lane near Temple-Bar, on the south side of Fleet Street, is a most extensive series of buildings, composing several squares and rows, called the Temple, and being the place of residence of the members of two societies, the Inner and Middle Temple, consisting of benchers, barristers, and students. The establishments possess a neatly trimmed garden, adjoining the river. In the cluster of buildings lying east from the Temple, once existed the sanctuary of Whitefriars, or *Alsatia*, as it was sometimes called, a description of which is given by Scott in the "Fortunes of Nigel." The streets here are still narrow and of an inferior order, but all appearance of Alsatians and their pranks is gone.

Strand.—The Strand is the long but somewhat irregularly built street in continuation westward from Temple-Bar, the thoroughfare being greatly incommoded by two churches, which, at a distance from each other, stand in the very middle of the way. In the seventeenth century, the Strand was a species of country road, connecting the city with Westminster, and on its southern side stood a number of noblemen's residences, with gardens towards the river. The grandest of these mansions was a palace, which had been erected in 1549 by the Duke of Somerset, Protector during a part of the minority of Edward VI.; on whose attainder it became crown property and a royal residence. The edifice was entirely removed in the reign of George III., and on the spot was erected, from designs of Sir William Chambers, about the year 1780, that magnificent quadrangular structure called *Somerset House*, which is devoted to the accommodation of various government offices. This noble stone building has its main front towards the Strand, while on the rear it presents an almost equally elegant façade to the Thames, which it closely overhangs. In the middle of the Strand front is the principal entrance, consisting of three open archways, leading into a spacious quadrangular court in the centre. The lines of buildings around, as may be observed from inscriptions over the doorways, contain the Navy Pay-Office, Stamp-Office, &c.; and in a brick building behind, at the north-western angle, is the office of the Poor-Law Commission. In the central part of the north line of building, near the river, is the suite of apartments devoted to various matters c with the royal navy, and including a museum o of ships, &c. Adjoining Somerset House on t and entering by a passage from the Strand, is of rather plain but massive brick buildings, lately for the accommodation of *King's College*. Th contains no other public structure of importa has some elegant stuccoed buildings at the we tremity, on the northern side; opposite, and o ing Charing Cross, is the large mansion of the Northumberland, distinguished by the figure o the family crest, on the summit.

Charing Cross.—The open space called Chari is marked by a figure on horseback of Charle the name of the locality is derived from the village of Charing, which once stood upon the the north side is an open quadrangular space, by the clearing away of buildings, now called T Square, and in the centre of which, a pillar is in commemoration of Lord Nelson. At the n angle stands *St Martin's Church*, whose po Sir Christopher Wren, is reckoned the most of its kind in the metropolis, or perhaps in th Adjacent, closing the northern side of the squ been lately erected, at an expense of £62,00 by Parliament, a building containing the *Natio lery* of Pictures. Mr Wilkins was the archi is in the Grecian style, but so long and so defi height or grandeur, as to be contemptible as a art. The National Gallery, which is freely op public, consists chiefly of a collection of pictu chased for £50,000 from the heirs of the late gerstein. The Royal Academy has apartment eastern division of the building, for its exhib pictures. The National Gallery is open on Tuesday, Wednesday, and Thursday, and the Easter and Whitsun weeks except Saturday, till five; but is closed for six weeks from the en second week in September.

Whitehall.—Whitehall Street, which runs in ern direction from Charing Cross, is a long cious thoroughfare leading to Parliament Stree terminates in Palace Yard, where the Houses liament are situated. On the western side of hall Street, and nearly throughout its length, series of large buildings, in various styles of ture, and used as government offices. The fir series, on our right going southwards, is the Ad which may be known by the telegraph on its ro is the Horse Guards, where the business of t is transacted, and which is outwardly distingu two mounted guards at the gateway, and an leading to St James's Park behind; next is t sury; and, lastly, the Board of Trade, and offi Privy-Council. A short street or place, leadi the corner of the building, and called Downing contains the official residences of the first lor treasury, the chancellor of the exchequer, th of the foreign and colonial secretaries of st On the eastern side of Whitehall Street, and the Horse Guards, stands a tall square massive of handsome architecture, designed by Inigo Jo built, at the order of James I., to serve as a ban house to his adjoining palace of Whitehall. The which reached to the river, was accidentally bur in 1695, when St James's Palace, in St James was erected, leaving the Banqueting-House to as an edifice for any public purpose. The gr is now used as a chapel; its roof is ornamen a painting by Rubens, representing the ap of James I. The Banqueting-House derives s choly interest, from having been the scene of cution of Charles I., who, on the 30th of January passed from an open window to a scaffold in fron he was beheaded in the presence of an immen course of spectators.

Westminster Hall—Houses of Parliament.— south side of Palace Yard, stands a somewh fused cluster of buildings of ancient and mode

ıg a central and beautiful old Gothic fabric, estminster Hall, some parasitic edifices de- ffices for courts of law, and other structures, re-edified wrecks of the houses of Parliament, rn a few years ago. Westminster Hall, which d exposed to Palace Yard, was built by Wil- us in the years 1097-8, and may be said to the body of a church; the interior is of ex- ry dimensions, being 270 feet long, 74 broad, igh; and the roof, consisting of ancient oak- ı an air of solemn grandeur. The floor is the free walking to and fro of lawyers, mem- ıs House of Commons, and others. The pre- se of Commons and House of Lords are neat nodious; but being only for temporary use, ndid edifice is erected for their accommoda- er to the river, nothing further need be said

nster Abbey.—Nearly opposite the houses of nt stands Westminster Abbey, open to inspec- ıe north and east, but much crowded upon by elling-houses on the west. In very early times, f ground was a small insular tract, surrounded ters of the Thames, and called Thorney Island. ıonastic institution was founded on the intro- f Christianity into Britain. Under Edward ssor, an abbey was raised upon the site of the onastic building. The ground plan, as usual, orm of the cross; rights and endowments were and the edifice assumed a great degree of ıral grandeur. It had become the place for uration of the English monarchs, and William ıeror was crowned here with great pomp and , in 1066. Henry III. enlarged the abbey, and ing continued in the state in which he left it ry VII. added a chapel, built in the florid Gothic

Westminster Abbey.

hich the greatest skill of the architect and the was displayed; exhibiting the most splendid of the age, and so highly esteemed, that it was hat the remains of royalty alone should be in- hin its walls. During the reign of Henry VIII. was considerably defaced, but on the surrender nues, Henry raised Westminster to the dignity and its abbey was constituted a cathedral. It ver, afterwards reunited to London in 1550. ter Abbey, during the reign of William and s thoroughly repaired, and the towers added tern entrance, under the direction of the cele- Christopher Wren, to whom London owes so ts architectural grandeur.

gth of the abbey is 416 feet; breadth at the 203 feet; nave, 102 feet; height of the west 25 feet. The exterior measurement, including I.'s Chapel, is 530 feet.

ring at the great western door between the e magnificence of the abbey at once strikes der with reverential awe: nearly the whole terior appears in grand masses of towering Gothic columns of grey marble, connecting the pavement with the roof, and separating the nave from the side aisles. A screen divides the nave from the choir, which is surmounted by a noble organ, while beyond, the eye soars amid graceful columns, tracery, and decorated windows, to the summit of the eastern arch that overlooks the adjacent chapels. The walls on either side display a great profusion of sepulchral monuments, among which are many finely executed pieces of sculpture, and touching memorials of those whose exploits or exertions deserved the notice of posterity.

Above the line of tombs there are chambers and galleries, once occupied by nuns, but now solemn and dreary in their antiquity, though relieved by the sunbeam glancing across the misty height of the nave. The northern window is richly ornamented with stained glass, representing the Holy Scriptures surrounded by a band of cherubim, in the centre; on the sides, the Saviour, the Evangelists, and Apostles, appear in recumbent attitudes. From this window proceeds a calm ray of light, very advantageous to the display of the beautiful sculpture on which it falls. There are numerous tombs and monuments of noble persons, exquisitely imagined and executed, in emblematical groups or in faithful portraiture, presenting to the spectator subject for deep reflection.

The Chapel of Edward the Confessor is at the eastern end of the choir, and contains the shrine of St Edward; that it was an exquisite piece of workmanship is evident even in its decay. Here also is the coronation-chair, under which is placed the celebrated stone brought from Scone in Scotland by Edward I., in 1297. The Chapel of Henry VII. is also at the eastern end of Westminster Abbey; and among the ashes of many whose brows were decorated with diadems, are those of Mary and Elizabeth. The ascent to this splendid piece of Gothic art, which has been extolled as the wonder of the world, is by steps of black marble beneath a stately portico. The entrance gates display workmanship of extraordinary richness in brass. The effect produced on entering this chapel is solemn and elevating: the lofty ceiling is wrought in stone into an astonishing variety of figures and devices; the stalls are of oak, having the deep tone of age, with Gothic canopies, all elaborately carved. Here are installed the knights of the most honourable the Order of the Bath. In their stalls are placed brass plates of their arms, and above are suspended their banners, swords, and helmets; beneath the stalls are seats for the esquires. The pavement is composed of black and white marble, beneath which is the royal vault. The magnificent tomb of Henry VII. and Elizabeth his queen, stands in the body of this chapel, in a curious chantry of cast brass, most admirably executed, and interspersed with effigies, armorial bearings, and devices, alluding to the union of the red and white roses.

Westminster Abbey is a collegiate church, with a dean and chapter, who possess a considerable authority over the adjoining district. The abbey may be considered as subdivided into nine chapels; but in the present day divine service is performed only in a space enclosed with wood, near the eastern extremity of the building. It takes place daily at ten in the morning and three in the afternoon, though sometimes none are present but the officials. The public worship of the parish is conducted in the adjacent church of St Margaret.

The abbey is usually entered by a side door at Poet's corner, which is nearly opposite the House of Lords. Here strangers will find admittance daily, and be conducted through the building on payment of certain fees.

Penitentiary.—Beyond Westminster Abbey in a southerly direction, there is no public building or institution requiring notice, except the Penitentiary at Millbank, near the extremity of Vauxhall Bridge. This great establishment for the confinement and reformation of offenders of secondary turpitude, occupies a very low situation near the Thames, and the external wall includes eighteen acres of ground. The plan of

the building, or buildings, is that of a hexagon, with six interior courts, and a building in the centre. The cost of building it was between £400,000 and £500,000, and it is calculated to accommodate 400 male and 400 female convicts. Latterly, the silent and separate systems have been adopted in the prison, under particular regulations.

THE PARKS, ROYAL PALACES, &c.

The Parks, which form one of the most beautiful features of the metropolis, are situated chiefly in a series from the back of Whitehall Street, in a westerly and northerly direction, and are thus blended with the fashionable end of the town. The most ancient of these open grounds is

St James's Park, so called from St James's Palace, which partly bounds it on the north. Originally these grounds were a marshy waste, which was drained and otherwise improved by Henry VIII., who also took down an ancient hospital dedicated to St James, and built on its site the palace now called St James's. Charles II. improved the grounds by planting the avenues of lime-trees on the north and south sides of the park, and forming the Mall, which was a hollowed, smooth, gravelled space, half a mile long, skirted with a wooden border, for playing at balls. The southern avenue was appropriated to aviaries: hence it derived the appellation Birdcage Walk. The centre of the park was occupied by canals and ponds for aquatic birds. William III. threw the park open to the public for their recreation. It is nearly a mile and a half in circumference, and the avenues form delightful shady promenades. In the centre is a fine piece of water, interspersed with islands, and covered with swans and various water-fowl. On each side are spacious lawns, dotted with lofty trees and flowering shrubs. The lawns are separated from the avenues by iron railings, and at each entrance is a keeper's lodge. There are seven or eight entrances to the park, the king's guard doing duty at each, day and night. At the east side of St James's Park is a large gravelled space called the Parade, on which, about ten o'clock every morning, the body-guards required for the day are mustered—about seven or eight hundred men; and here the regimental bands perform every morning between ten and eleven o'clock. At the south side of the parade is placed a huge mortar, brought from Spain; and at the north end is a piece of Turkish ordnance, of great length, brought from Alexandria, in Egypt. A little farther north from the parade, is a broad flight of steps, giving entrance to the park from Waterloo Place, constructed by order of William IV.; these steps are surmounted by a lofty column, commemorative of the late Duke of York, which occupies the spot where lately stood Carlton Palace, the favourite residence of George IV. while Prince Regent. The buildings near this, which overlook the park, are lofty and elegant. Farther along the Mall, or avenue, is St James's Palace, an inelegant brick structure, having its front towards Pall-Mall. The interior consists of several spacious levée and drawing rooms, besides other state and domestic apartments. This palace is only used occasionally by the queen, the principal royal residence being now

Buckingham Palace.—This edifice stands at the west end of the Mall in St James's Park, in a situation much too low in reference to the adjacent grounds on the north. The site was chosen by George IV., and the structure rose under the care of Mr Nash, architect; when completed, after various capricious alterations, about 1831-2, it is said to have cost about £700,000. The edifice is of stone, with a grand centre, and a wing of similar architecture projecting on each side, forming an open court in front; on the extremities are colonnades, giving a noble expanse to the building. The basement is of the Doric, and the superior part of the building of the Corinthian order; the summits are adorned with statues. The interior contains many beautiful and magnificent apartments, both for state and domestic purposes; but so ill has the plan been conceived, that in a number of the passages quire to be kept lighted during the day. In of the palace is the Waterloo triumphal ar forms an entry to the palace.

The Green Park rises with a gentle slop north of Buckingham Palace, and is bound east side by many fine mansions of the nob a north-westerly direction from the palace i road called Constitution Hill, connecting St Park with Hyde Park Corner. On the nor line of terrace-like street, forming the we tremity of Piccadilly. The whole of the Gr is surrounded by iron railings, and is interes its unequal grassy surface, which rises consid the north side. From the highest ground pleasing prospect of Buckingham Palace, a James's Park with its ornamental grounds an of tall trees, over which Westminster Abbey cally rises, accompanied by the Gothic turret buildings. At the north-west angle of the p head of Constitution Hill, where Piccadilly te there is a triumphal arch of the reign of Ge elaborately decorated, but possessing little effect. Across the way is the handsome en Hyde Park; and here, in the after part of t fine weather, may be seen an extraordinary c of foot passengers, vehicles, and gentlemen c back, going to and returning from Hyde Pa the general traffic between Piccadilly and Ke Brompton, and other places in a westerly dire

Hyde Park is part of the ancient manor which belonged to the monastery of St Peter, minster, till Henry VIII. appropriated it di Its extent is about 400 acres, part of which is ably elevated. The whole is intersected wi roads, lawns with luxuriant trees, planted sin groups, presenting beautiful examples of di prospects. At the south-east corner, the entra Piccadilly, on an elevated pedestal, stands a and dark statue of Achilles, cast from the cann at the battles of Salamanca and Waterloo, thirty tons, and "erected to the Duke of W and his companions in arms, by their country

The long sheet of water called the Serpenti enriches the scenery of Hyde Park. At its extremity is a stone bridge of five large and tw arches, erected in 1826, giving access to the of Kensington Palace. On the level space Park, troops of the line are occasionally r The great road through the Park to Kensingt nominated Rotten Row, and is a fashionable r equestrians wherein to show off their high-bre Other roads display countless elegant equipag nobility, gentry, and others; while the footpath are railed off from the roads, are crowded well-dressed inhabitants of London, enjoying brity of the air and the gaiety of the scene, m ticularly between two and five on a Sunday af There are five entrances open from early mor nine at night. No stage or hackney coaches mitted within the gates of Hyde Park.

Kensington Gardens.—At the western extr Hyde Park lie Kensington Gardens, a large ground laid out in the ornamental park styl spersed with walks, and ornamented with r clumps of tall trees. Besides an entrance fro Park, there is an entrance from the Knigh road, or continuation of Piccadilly. The gro open daily to all respectably dressed persons the west end of the grounds stands Kensington a large red brick building, and which serves a dence for members of the royal family. It chased from Lord Chancellor Finch, and gre proved, by William III., since whose time the adjoining have been considerably extended, they now measure about two and a half mile cumference. These grounds form a most d public lounge during fine weather.

Regent's Park is situated considerably ab

the other parks, in a northerly direction from the preceding grounds, and consists of a circular enclosure of about 450 acres, which are laid out on the most approved principles of what is called landscape gardening; its centre is enriched with lakes, plantations, shrubberies, and eight beautiful villas. The park is surrounded by extensive ranges of buildings, forming splendid terraces, variously designated, and all decorated with sculpture in agreement with their respective orders of architecture; producing an effect of beauty and grandeur rarely witnessed. At the south end of the Park, the *Colosseum* stands conspicuous, with its immense Doric portico and circular roof, rising from a polygon of sixteen faces, occupying an area of 400 feet. The main design of this large structure is to exhibit a kind of panoramic view of London, and this is accomplished with surprising fidelity and effect. The representation is exhibited as seen from the top of St Paul's, and to gain this imaginary height, the visiter mounts a central tower. Besides this view of London, there are several conservatories and other sights connected with the Colosseum, all which are exceedingly worthy of being visited. On the border of the Park is the celebrated exhibition called the *Diorama*, which consists of painted representations of landscapes or buildings; on particular parts of the scene illuminations of different hues are so judiciously cast, as to produce a perfect resemblance to nature.

Zoological Gardens.—At the northern extremity of the Regent's Park are the Zoological Gardens, the property of the Zoological Society, and established in 1826. These gardens are very extensive, and being removed from the dingy atmosphere, noise, and bustle of London, they present an agreeable and truly country-like aspect. The grounds have been disposed in the style of landscape-gardening—here a clump of shrubby trees and border of flowers, indigenous and exotic; there a pretty miniature lake; and at proper intervals is seen a neat rustic cot, with its straw-thatched roof and honeysuckled porch. Much of the ground, also, is occupied as green meadows, either subdivided into small parks for deer and other quadrupeds, or dotted with moveable trellis houses, the abodes of different kinds of birds which require the refreshing exercise of walking on the green turf. Throughout the whole, neat gravel walks wind their serpentine course, and conduct the visiter to the bear-pit, monkey-house, aviaries, and other departments of the establishment. The gardens are open every week-day for the admission of visiters, who must previously procure an order from a member of the society, and likewise pay a shilling each at the gate.

The West End.—Returning up Whitehall Street to Charing Cross, the stranger may pursue his tour through Cockspur Street to Pall-Mall, and thence proceed up Regent Street. As he enters this new line of route, he will perceive that the buildings assume an exceedingly imposing aspect. They are for the most part covered with a composition to resemble stone, and being in some instances painted, they have a light and cheerful appearance. At the foot of Regent Street is the short broad thoroughfare of Waterloo Place, lined with noble mansions, and leading southwards to St James's Park. Here stands the elegant column dedicated to the late Duke of York. From this point, for about a mile in a northerly direction, is the line of Waterloo Place and Regent Street, forming the handsomest street in London. At a point a short way up, we cross Piccadilly, and enter a curve in the thoroughfare, called the Quadrant: the fronts of the houses here are lined with arcades and pillars, so as to form a covered path on each side of the way. At the corners of the Quadrant, and also in Upper Regent Street, there are now some of the most splendid shops in London, several being decorated in a style of extraordinary magnificence. Regent Street, during the busy season in May and June, and during the day from one till four o'clock, exhibits an extraordinary concourse of fashionable vehicles, gentlemen on horseback, and foot passengers; while groups of carriages are drawn up at the doors of the more elegant shops. Towards its upper extremity, Regent Street crosses Oxford Street; and the mass of streets west from it, throughout its entire length, may be said to include the residences of the greater part of the nobility and other high classes of London. In this quarter are Old and New Bond Streets, Hanover, Berkeley, Grosvenor, Cavendish, and Portman Squares (the two latter north of Oxford Street); and in connexion with these squares there are long quiet streets, lined with houses suited for an affluent order of inhabitants. In and north from Oxford Street, and in its eastern continuation, Holborn, there are few public buildings deserving particular attention: the only institution of general importance north from Holborn is the

British Museum.—This is a great national establishment (the property of the public), containing a vast collection of books, prints, antiquities, and natural curiosities. It occupies a most extensive suite of buildings in Great Russel Street, Bloomsbury. Since its commencement in 1755, the collection has been prodigiously increased by gifts, bequests, and purchases, and now it is perhaps the largest of the kind in the world. The library is open only to persons who proceed thither for study or for consulting authorities, no general inspection by strangers being allowed. The portions open to ordinary visiters consist of an extensive series of large apartments on the ground and upper floors, each devoted to the exhibition of a distinct class of objects. Among others are the following:—Room 1, Terracottas; 2, 3, 4, and 6, Greek and Roman sculptures; 5, Roman sepulchral antiquities, and Sir T. Lawrence's collection of casts; 7, British antiquities; 8, Egyptian antiquities; 9, Portland Vase; and several saloons containing the Elgin Marbles, and massive Egyptian antiquities. The rooms containing objects in natural history and artificial curiosities, are handsomely fitted up with glass-cases on the walls and counters. The most deeply interesting collection in the whole establishment is that of Egyptian antiquities—consisting of smaller objects, including mummies in cases, on the upper floor, and huge remains in stone in the saloons below. Days may be spent in examining this vast assemblage of objects; and to assist in the inspection, catalogues for the entire museum may be purchased at the door.

The British Museum is open from October to April on Mondays, Wednesdays, and Fridays, and the whole of Easter and Whitsun weeks, except Saturday, from 10 till 4; from May to September, 10 till 7. It is closed on the first week in January, May, and September, and on Christmas-day, Good Friday, and Ash Wednesday No fee whatever is payable.

PLACES OF INTEREST NEAR LONDON.

The chief places of an interesting kind near London are, Woolwich, Greenwich, and Deptford, already mentioned, on the east; Dulwich on the south; and Chelsea, Richmond, Hampton Court, and Windsor, on the south-west.

Dulwich is a pretty village, lying within the extended suburbs of the metropolis, in Surrey, in a southerly direction from London Bridge. Here Edward Alleyn, or Allen, a distinguished actor in the reign of James I., founded and endowed an hospital or college, for the residence and support of poor persons, under certain limitations. The founder bequeathed some pictures to the institution, and the collection was vastly increased by the addition of a large number bequeathed in 1810, by Sir Francis Bourgeois. A splendid new gallery was opened in 1817; and this now forms a most attractive sight to all who delight in the fine arts. The gallery is open every forenoon, except on Fridays and Sundays. Tickets to view it may be had *gratis* from Colnaghi, Pall Mall, and other printsellers.

Chelsea.—Chelsea is a village on the west of the metropolis. It is only eminent for its hospital for retired invalid soldiers, an institution similar in all respects to the asylum for decayed sailors at Greenwich.

The hospital, which is situated on a flat stretch of ground between the village and the Thames, and was planned by Sir Christopher Wren, consists chiefly of one large edifice of red brick, several storeys in height, forming a centre and two wings, or three sides of a square, with the open side towards the bank of the Thames. On the north, in which is the main entrance, the style of architecture is simple, being ornamented with only a plain portico. The inner part of the centre building is more decorated, there being here a piazza of good proportions, forming a sheltered walk for the veteran inmates. In the centre of the open square interval stands a statue of Charles II., in whose time the hospital took its rise. The only parts of the house considered worthy to be shown to strangers are the chapel and old dining-hall, both in the central building. The chapel is neat and plain in appearance, the rows of benches being furnished with prayer-books and hassocks, and the floor being paved with marble in alternate black and white squares. Above the communion-table there is a painting of the Ascension, containing some good figures. The dining-hall is equally spacious, but is now disused as a refectory, though the tables stand ready covered for use.

The usual number of in-pensioners is about 476, and of out-pensioners not fewer than 80,000, who reside in all parts of the United Kingdom. The former are provided with all necessaries, and the latter have each pensions varying from £7, 12s. to £54, 15s. yearly. The inmates wear an antique garb of red cloth, in which they may be seen loitering about the village.

Near Sloane Square, Chelsea, is situated a large building forming the *Royal Military Asylum*, for the support and education of about 500 poor children, whose parents were non-commissioned officers and privates in the army. Each regiment contributes annually one day's pay, to aid in supporting the institution.

Richmond.—Richmond is a village situated on the south bank of the Thames, at about nine miles by land from Hyde Park Corner, and sixteen miles by following the windings of the river. The most pleasant mode of conveyance to it is by one of the small steam-boats from Hungerford Stairs, for then an opportunity is afforded of seeing numerous beautiful and interesting spots on both banks of the river. In passing upwards, we have on our right, Chelsea; Fulham, at which is the residence of the Bishop of London; and the pretty village of Chiswick; on the left, Battersea, Putney, Mortlake, the royal residence of Kew and its gardens, next which is Richmond. The village of Richmond stands on a slope overhanging the river, and possesses no point of attraction. Opposite the village is a stone bridge crossing the Thames, which is here very much narrowed, and further than this steam-vessels do not go. Richmond is only interesting from its exceedingly beautiful environs. South from the village, a pretty steep bank ascends to the green and bushy eminence called Richmond Hill, and from the walks on its prominent front, a view is obtained of the beautifully wooded country on the opposite side of the river. Among numerous villas, ornamental grounds, and other attractive objects, may be seen Twickenham, situated in the immediate vicinity, on the west bank of the Thames. In the house for which the present was erected as a substitute, lived Pope, the poet, and his body is entombed in the church. Close by Twickenham is Strawberry Hill, once the seat of Horace Walpole, and now belonging to Lord Waldegrave. Moving onwards along the brow of the eminence, and passing the well-known hotel called the Star and Garter, we enter the famous Richmond Park, which is eight miles in circumference, and ornamented with many magnificent large trees. These extensive grounds were at one time connected with a royal palace, but there is now no such edifice—one or two hunting

excepted, and these are not used by royalty; but
s still a domain of the crown, and freely open

trangers residing for a few days only in the metropolis; nd to accommodate this numerous transient popula- ion, there is a vast number of lodging and board- ng-houses, hotels, and other places of accommodation. few years ago, the metropolis possessed 207 hotels, nns, and taverns; 3780 public-houses of licensed vic- uallers; and 130 beer-shops. The fashionable hotels re situated west of Charing Cross—as, for instance, Mivart's, in Brook Street, Grosvenor Square, and Davis treet, Berkeley Square; Warren's, in Regent Street; Preston's, St James's Street; Lemmer's, George Street, Hanover Square; the Clarendon, in New Bond Street; he Burlington, in Old Burlington Street; Wright's, in Dover Street, Piccadilly; Morley's, Trafalgar Square, c. At all the fashionable and family hotels in the west end" the charges are very high, and the majo- ity of the respectable middle classes lodge at hotels nd boarding-houses east of the Strand. In and about Covent Garden there are several highly respectable otels for single gentlemen; among others, the Caven- ish, the New and Old Hummums, and the Tavistock. Another class of hotels or inns are those to which tage-coaches run, and which are resorted to by com- mercial and other gentlemen; as, for example, the Golden Cross, near Charing Cross; the Bolt-in-Tun, Fleet Street; the White Horse, Fetter Lane; the Bell nd Crown, Holborn; the Saracen's Head, Snow Hill; he Swan with two Necks, Lad Lane; the Spread Eagle, Gracechurch Street; the Belle Sauvage, Lud- gate Hill; and the Bull-in-Mouth, opposite the General ost-Office, in St Martin le Grand. To these we may dd three large inn and tavern establishments at the outskirts of the town—the Angel at Islington (northern nvirons); the Elephant and Castle, Newington Cause- way; and the Horns, Kennington Common (both outhern environs).

In and about the city there are various large and espectable taverns, at each of which gentlemen are ngaged in a comfortable manner; but they are practi- ally designed for accommodating dinner and festive arties. Among these may be mentioned, the London nd City of London Taverns, both in Bishopsgate treet; the Albion, in Aldersgate Street; the Crown nd Anchor, Strand; the Thatched House, St James's treet; Freemasons' Tavern, Lincoln's Inn Fields; the British Coffee-house and Tavern, Cockspur Street; and he London Coffee-house and Tavern, Ludgate Hill. There is, besides, a class of coffee-houses or taverns, hose chief business is supplying small refreshments nd dinners, also the accommodation of newspapers, nd which are resorted to only by gentlemen. Each of hese has a distinct character. Garraway's and Lloyd's, t the Royal Exchange, are associated with marine in- elligence, stockjobbing, and auctions; and in Corn- ill, opposite, the North and South American Coffee- ouse supplies American newspapers, and here also re to be seen the captains of vessels who are prepar- ng to sail to different ports in the western continent nd islands. At Jerusalem and East India Coffee- ouse, Cowper's Court, Cornhill, information relating o East India shipping and captains may be obtained rom the waiter at the bar. The Chapter Coffee-house, n Paternoster Row, is the resort chiefly of literary nd clerical gentlemen, and is a place of grave aspect. 'eel's Coffee-house, in Fleet Street, is celebrated for eeping files of newspapers, which may be consulted; ut this accommodation, as respects London papers, ay also be had at the Chapter. A small fee is payable o the waiter for examining files at these houses.

The next class of houses of this nature are chop or ining-houses, but also doing the business of taverns, and esorted to only by gentlemen—as Dolly's Chop-house, n Paternoster Row; Dr Johnson's Tavern, in Bolt ourt (a few doors from Farringdon Street), in Fleet treet; also the Mitre, in Fleet Street. Latterly, there as sprung up a very numerous class of coffee-houses, f a much more humble though perhaps more useful ature, at which cups of ready-made coffee and tea, with ices of dressed meat, may be obtained at very moderate

prices. In most of these establishments the charge is (or was lately) three halfpence for half a pint of coffee; half a pint of tea, twopence; two slices of bread buttered, twopence; eggs and meat proportionably cheap. While these establishments are chiefly resorted to for breakfast or for refreshment in the evening, there is a far more numerous class of eating-houses, resorted to for dinners by the shopkeeping and working classes. We have only room to mention a few great houses—Morton's Excise Dining-rooms, in Bishopsgate Street, where about nine hundred dine daily; the famous Boiled-Beef House, Old Bailey (near Ludgate Hill); the Chancery Dining-rooms, in Chancery Lane; and Hancock's Dining-rooms, in Rupert Street (a short distance from the head of Haymarket).* An excellent dinner may be had at any of these houses for about 1s. 3d., or even less.

Throughout the town there are now many splendid dram-shops called gin-palaces; but of these haunts of intemperance nothing need be said.

PUBLIC RECREATION AND AMUSEMENT.

The chief places of resort during the day, for the recreation and amusement of strangers, may be summed up as follows:—The Parks; the Zoological Gardens in the Regent's Park; another Zoological Garden in Surrey; the British Museum; the National Gallery; the Exhibitions of the Royal Academy, of the Society of British Artists, and of the Society of Painters in Water Colours; the Diorama and the Colosseum, Regent's Park; Sir John Soane's Museum in Lincoln's Inn Fields, open Thursday and Friday during April, May, and June, from 10 till 4 (tickets must be previously applied for); the exhibition of interesting objects of science and arts, Adelaide Gallery, Lowther Arcade, Strand; a similar exhibition at the Polytechnic Institution, Regent Street. Several noblemen permit inspection of their picture-galleries: it is admitted that the most extensive and valuable is that of the Duke of Sutherland, Cleveland House, St James's Place. Besides the regular places of recreation, there are always temporary exhibitions of things interesting to strangers, at the Egyptian Hall, Piccadilly, places in the Strand, &c. Public meetings frequently occur at Exeter Hall, Strand.

The places of evening entertainment are various; and first may be mentioned the theatres, of which there are upwards of twenty in the metropolis. The principal are the Queen's Theatre, or Italian Opera House, foot of Haymarket; Drury Lane and Covent Garden Theatres, being the two licensed for the legitimate drama, and open in the winter season; the Haymarket Theatre, for legitimate drama also, but only open in summer; the Adelphi, in the Strand; the Surrey Theatre, Blackfriars Road; and Astley's Royal Amphitheatre, Westminster Bridge. Latterly, Drury Lane Theatre has abandoned theatricals, and is now opened for cheap evening concerts. Vauxhall Gardens, long a place of evening resort, have been finally closed, having latterly proved ruinous to its lessees. Nearly all the theatres are in a languishing condition, and a large and respectable part of the community now prefer attending Lyceums and Literary Institutions, which combine occasional lectures, a reading-room, and library. One of these establishments is in Aldersgate Street, in the city, and another is in Leicester Square, for the western part of the town. Strangers are introduced by members.

CIVIC GOVERNMENT, POLICE, &c.

With respect to civic jurisdiction, the city of London is governed in a peculiar manner. In virtue of ancient charters and privileges, the city is a species of independent community, governed by its own laws and functionaries. While all other boroughs have been reformed in their constitution, London has been suffered to remain, as yet, in the enjoyment of all its old usages. The city is civilly divided into twenty-five wards, each of which has an alderman who is chosen for life, and acts as magistrate within his division. The freemen of the various wards elect representatives annually to the common-council, to the number of 236 members. The lord-mayor, aldermen, and common-council, compose the legislative body for the city. The lord-mayor is chosen by a numerous and respectable body of men, called *the livery*, or liverymen; these are certain qualified members of trading corporations, who, except as appointing the lord-mayor, sheriffs, members of parliament, &c., do not actively interfere in city management. The revenue of the city corporation, which is derived from sundry dues, rents, interest of bequests, fines for leases, &c., amounted in 1832 to £186,923, 10s. 10d., and the expenditure was nearly the same. The magistracy, police, and prisons, cost about forty thousand pounds annually, but this is exclusive of large sums disbursed by the court of aldermen. The trading companies at present existing are eighty-nine in number, eight which formerly existed being now extinct.

The lord-mayor is elected annually, on the 29th of September, from among the body of aldermen. The livery send a list of two candidates to the court of aldermen, and one of these, generally the senior member, is chosen by them. He enters office, with much pomp, on the 9th of November, which is hence called Lord Mayor's Day. The advocate and legal adviser of the corporation is an official with the title of recorder. The lord-mayor and corporation exercise a jurisdiction over Southwark and other precincts. Westminster, which is not connected in civic matters with London proper, is under the jurisdiction of a high-bailiff. The county of Middlesex is represented in parliament by two members, chosen by the freeholders; the city of London by four, chosen by the liverymen; Westminster, two, chosen by the rate-paying householders; Marylebone, two; Tower Hamlets (eastern precincts), two; Finsbury (northern precincts), two; Southwark, two; and Lambeth, two. Thus the metropolis, with its immediate neighbourhood, including about two millions of souls, returns eighteen members to the House of Commons, without reckoning those who are sent by the county of Surrey.

Police.—In 1829 the old mode of watching was abolished, in all parts of the metropolis except the city, and a new police force established by act of Parliament. This has been a highly successful and beneficial improvement. The new police is under the management of two commissioners, who are in direct communication with the secretary of state for the home department; under the commissioners are 17 superintendants, 70 inspectors, 342 sergeants, and 2968 constables. The district under their care includes the whole metropolis and environs, with the exception of the city. The constables wear a blue uniform, and may be seen on the street on duty at all times of the day and night. The expense of this most efficient police force in 1837 was £209,754, 11s. 11d. Three-fourths of the expenses are paid out of the parish rates, but limited to an assessment of 8d. per pound on the rental; the remainder is contributed from the public purse. Latterly, the lord-mayor and aldermen have established a police force for the city on the model of that above mentioned. It consists of 1 superintendant, 12 inspectors, 50 sergeants, and 638 constables. In addition to these two police bodies, there are nine police offices, in Bow Street, Queen Square, Hatton Garden, &c., each with a small body of active officers; and there is likewise a river police, consisting of 22 surveyors and 70 constables. In 1836 a horse patrol was added to the Bow Street establishment, consisting of 4 inspectors and 66 patrols, whose sphere of action is the less frequented roads around the metropolis. With all these means of preserving the peace and preventing crime, the metropolis is now one of the most orderly towns in the world; and provided strangers do not seek the haunts of vice, but pursue their way steadily, they run no risk of molestation.

Fires.—In 1833, by an arrangement among the fire assurance offices, there was established a regular fire-suppression police, consisting of a superintendant, 5

ned in prime order. The finest oysters are called
er, and are sold in small quantities to those who
to eat them on the spot.

vent Garden market (connected by Southampton
t with the Strand), is the great vegetable-market
he metropolis. The spot, which is exceedingly
al to the metropolis, was once the garden to the
and convent of Westminster. At the suppression
e religious houses in Henry VIII.'s reign, it de-
ed to the crown. Edward VI. gave it to the Duke
merset; on his attainder it was granted to the
of Bedford, in which family it has remained.
a design of Inigo Jones, it was intended to have
rounded the space with a piazza, but the north and
sides only were completed. The west side is occu-
by the parish church of St Paul's, celebrated for
xpansive roof, sustained by the exterior walls.
election of members to serve in Parliament for
ity of Westminster is held in front of this church;
places for receiving the votes are temporary build-
. The south side is occupied by a row of brick
dings. Within this square, fruit and vegetables of
best quality are exposed for sale. A large paved
, surrounding the interior square, is occupied by
market gardeners, who, as early as four or five in
morning, have carted the produce of their grounds,
wait to dispose of it to greengrocers, or dealers in
and vegetables, residing in different parts of Lon-
any remainder is disposed of to persons who have
dings in the market, and they retail it to such in-
duals as choose to attend to purchase in smaller
tities. Within this paved space, rows of shops are
eniently and elegantly constructed for the display
e choicest fruits and vegetables of the season: the
ductions of the forcing-house, and the results of
ticultural perfection, appear in all their beauty.
re are also conservatories, in which every splen-
of the garden may be obtained, from the rare
ic to the simplest native flower.

he cultivation of vegetables in the open ground
in ten miles surrounding London, has arrived at
t perfection; and so certain is the demand, that
whole is regularly conveyed by land or water to
metropolis, so that persons residing in the neigh-
hood of those well-arranged gardens have no sup-
of vegetables but from their own resources. The
al produce of the garden grounds cultivated to
ly the London markets with fruit and vegetables,
unts to £1,045,000.

he greater part of the corn used for bread and
r purposes in the metropolis, is sold by corn-factors
Mark Lane; but much also arrives in the form of
. In 1838, the consumption of wheat was 525,407
ters, and of flour 515,005 sacks. The annual con-
ption of butter is 11,000 tons; of cheese, 13,000 tons.
quantity of poultry annually consumed amounts to
000, independent of game. The annual consump-
of milk is said to amount to £646,000.

1837, it was found that the malt used in brewing
ondon amounted to 5,692,360 bushels; and that
were sent out of stock for consumption 1,270,231
ns of foreign spirits, 5,354,383 gallons of British
ts, 3,636,362 lbs. of tobacco, and 1,181,723 lbs. of
. A certain portion of these supplies would doubt-
be drawn by families in the country.

he water used in the metropolis is chiefly supplied
he Thames, and an artificial canal called the New
r. The water is naturally good and soft, but far
pure, notwithstanding the filtration to which it is
ected. The spots at which it is raised from the
nes, are within the bounds of the metropolis, at
reat distance from the mouths of common sewers;
forms one of a number of evils to which the in-
ants submit with a remarkable degree of indiffe-
e. The water supplied by the New River Company
ore pure, but is charged at a high rate. Eight
panies are concerned in the supply of water, and the
quantity distributed daily amounts to 20,829,555
rial gallons.

The metropolis is supplied with coal principally from the neighbourhood of Newcastle, and partly from Wales, and certain inland counties; the import from the latter being by canals. Newcastle coal is preferred. It arrives in vessels devoted exclusively to the trade, and though the charge for freight is small, so many and so excessive are the duties and profits affecting the article, that a ton of coal, which can be purchased at Newcastle for about 5s., costs, to a consumer in London, upwards of 30s. The quantity of coal imported in 1838 was 2,531,035 tons.

It has been calculated that the money spent annually in London, on articles of consumption and luxury, amounts to £70,000,000; being more than a third of what is spent for such purposes in the whole united kingdom.

MISCELLANEOUS INFORMATION.

The metropolis contains 500 places of public worship, and attached to these there are not fewer than 600 clergymen. Exclusive of the places of worship of the Jews and various small sects, the number of dissenting chapels in London was lately 200, as follows:—Chapels of Independents, 66; Wesleyan Methodists, 36; Baptists, 32; Calvinistic Methodists, 30; Presbyterians, 16; Roman Catholics, 14; Quakers, 6; total, 200. The chapels of dissenters are principally in the eastern suburbs of London. The largest of the Roman Catholic chapels is in this quarter, near Finsbury Square. The original Tabernacle, erected by Whitfield, is in Tottenham Court Road. The chapel of the late Rev. Rowland Hill, which can contain 5000 persons, is in Blackfriars Road. Each of the established churches is surrounded with a small burying-ground, and many churches have vaults beneath for sepulture. The odious practice of burying in these confined situations is now gradually going out of use; and many interments take place in new cemeteries in the environs. These cemeteries, which are respectively the property of joint-stock companies, are laid out in a neat manner, and are well worthy of a visit from strangers. The oldest established is that at Kensal Green, in the north-western environs, on the road to Harrow. Others are at Norwood in the south, Highgate in the north, and Stoke Newington in the north-eastern environs, and several are in course of establishment. The annual number of deaths in London is about 50,000.

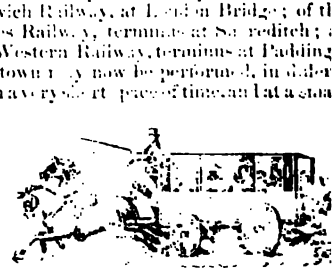
London abounds in charitable institutions of various kinds. The charities connected with the corporation of London are Christ's Hospital, for boarding and educating youth, already mentioned; Bethlehem Hospital, for insane patients; St Thomas's Hospital, Southwark, for poor patients diseased and hurt; and Bartholomew's Hospital, West Smithfield, for the same purpose. The trades' companies likewise support a number of beneficiary institutions. The following hospitals have been founded and are supported by private benevolence:—Guy's Hospital, Southwark; London Hospital, Whitechapel Road; Westminster Hospital; St George's Hospital, Hyde Park Corner; Middlesex Hospital, Charles Street, Oxford Street; the University College Hospital; St Luke's Hospital, City Road; Small-Pox Hospital, and London Fever Hospital, St Pancras; and Lock Hospital, Pimlico. Besides these, there are four lying-in hospitals; a floating hospital; various ophthalmic hospitals, and numerous dispensaries and infirmaries for particular diseases. Institutions for relief of indigent persons, deaf and dumb asylums, blind asylums, and Orphan asylums, are far too numerous to be specified.

Under the orders of the Poor-Law Commissioners, the metropolis is divided into 20 districts or unions, which, in 1838, absorbed an expenditure on the poor of £401,952. By the active management of the guardians, the annual expenditure is much less than it was under the old wasteful parochial system, while the poor are allowed to be now better employed and more comfortable. Begging is followed as a profession in the metropolis, and there are many persons who subsist by tricks of imposture; nevertheless, although, as has been alleged, there are 15,000 regular beggars of various kinds, it is certain that fewer signs of absolute want and misery meet the eye in London than in other towns. As an instance of the growth of provident habits in the humbler orders, it has been stated that in 1837, about 97,000 persons resident in the metropolis had accounts at the different Savings' Banks, and the sum standing at the credit of their accounts was about £2,450,000.

The principal educational establishments in the metropolis are the University College (northern branch), King's College, Strand; and University College, Somerset House. There are also some public schools, one of which is that of Westminster, which are more interesting from their antiquity than their usefulness. The National Society for the Education of the Poor, and the British and Foreign School Society, have each large model schools in the metropolis—that of the British and Foreign, Borough Road, is open to inspection for its great extent and its well-conducted routine of elementary instruction. The metropolis is the seat of from forty to fifty societies connected with science, literature, and the arts, which may be considered of national importance. Among these are the Royal Society, Society of Antiquaries, Linnæan Society, Zoological Society, Society for Diffusion of Useful Knowledge, Horticultural Society, Royal Geographical Society, Sion College, &c. For a notice of the meetings of these societies, we refer to the *Athenæum*, a literary periodical.

Lately there were eleven newspapers published in London—six in the morning and five in the evening. There were also twenty-four weekly newspapers, thirty-eight which appeared at other intervals, and there were besides about fifty small literary publications issued weekly, the greater part of which are of improving tendency. Of larger periodicals belonging to the metropolis, there are altogether about one hundred and twenty, which are issued at quarterly or other intervals, but chiefly monthly. It has been calculated that the number of such works sold on the first of every month (locally termed magazine day) in London amounts to half a million of copies, occasioning an expenditure to the public of £25,000.

In recent times, great improvements have taken place in the vehicular conveyance of the metropolis and its neighbourhood. By the trains of the London and Birmingham Railway, terminus at Euston Square; the South-Western Railway, terminus at Nine Elms; the Croydon Railway, terminus at Bricklayers' Arms; the Greenwich Railway, at London Bridge; of the Eastern Counties Railway, terminus at Shoreditch; and the Great Western Railway, terminus at Paddington, the journey out of town may now be performed, in different directions, in a very short space of time, and at a small



Within the metropolis, hackney coaches, cabriolets, cabs, and omnibuses, are exceedingly plentiful. The fare charged for hackney coaches is 1s. per mile, and for cabs 6d. per mile. The fare by omnibus is 6d. for the ride, whether short or long. These vehicles, of which there are now about 700 in constant operation, run from all parts of the environs to the centre of London, and also crosswise in different directions, and as their drivers are most active in taking and setting down passengers, they may be said to be one of the greatest of modern improvements in the metropolis.

SCOTLAND.

an, on the north by the Northern Ocean, on the
t by the Atlantic, and on the south by England.
greatest length is 284, and the greatest breadth
miles. The entire surface, including the islands,
tains 30,000 square miles, or nearly 20,000,000 of
glish statute acres.

o the north of a southward curving line, stretching
ween Glasgow and Aberdeen, the country is more
ntainous than elsewhere, and therefore bears the
eral appellation of the *Highlands*. This is a district
of romantic scenery—savage precipitous mous-
s, lakes, rushing streams, and wild ranging man-
woods. Its population, numbering about 400,000,
a sixth of the entire population of the country,
f Celtic (and in a less degree Scandinavian) de-
nt, and exhibits many peculiar features, in language,
s, and manners, which are, however, rapidly be-
ing obliterated. The remainder of the country is
ned the *Lowlands*, as containing less ground of
levated and irregular character, though here also
re are several considerable ranges of mountains.
inhabitants of this district, who are more pecu-
ly entitled to be considered as *the Scotch*, are, like
English, a Teutonic people, but with probably a
ture of Celtic blood; and their language may be
sidered as only a variety of English.

onnected with Scotland are two large groups of
nds; namely, the *Northern Islands*, including the
ney and Shetland Isles, situated in the Northern
an; and the *Hebrides* or *Western Islands*, situated
he Atlantic Ocean.

cotland and its islands contain thirty-three coun-
, which may be thus classed:—*Border Counties* (so
ed because forming the border adjacent to England)
erwick, Roxburgh, and Dumfries. *South-Western*
nties—Kirkcudbright and Wigton. *Western Coun-*
—Ayr, Lanark, Renfrew, Bute, and Argyll. *Cen-*
Counties—Peebles, Selkirk, Haddington, Edinburgh,
lithgow, Stirling, Dumbarton, Clackmannan, Kin-
s, Fife, and Perth. *North-Eastern Counties*—Forfar
Angus), Kincardine (or the Mearns), Aberdeen,
ff, Elgin (or Moray), and Nairn. *Northern Coun-*
—Inverness, Ross, Cromarty, Sutherland, Caithness,
Orkney.

or ecclesiastical purposes, the country is divided
parishes (which are also civil divisions), presby-
es, and synods. (See CONSTITUTION AND RESOURCES
THE BRITISH EMPIRE.)

he principal rivers are Tweed, Annan, Nith, Dee
rkcudbright), Ayr, Clyde, Beauly, Ness, Findhorn,
y, Deveron, Ythan, Don, Dee (Aberdeenshire), Tay,
th, Carron, Leith, and Tyne. The Tay is the most
idus, and the Spey the most rapid. Scarcely any of
e rivers are navigable to a considerable distance
n the sea.

he mountains of Scotland are generally in groups
anges. The Highlands may be considered as com-

great cluster of hills; but those bordering on the Lowlands, and extending between Stirlingshire and Aberdeenshire, are more particularly distinguished as the *Grampian Mountains*. The other principal ranges are the *Sidlaws* in Forfarshire; the *Campsie Hills* in Stirlingshire; the *Pentlands* in Edinburghshire; the *Lammermoors*, extending between Berwick and Haddingtonshires; the *Cheviot Hills* on the Border; and a great range, of no general name, extending throughout the counties of Selkirk, Peebles, Dumfries, Lanark, Ayr, and Kirkcudbright. The most noted of the Highland mountains are Ben Nevis (4370 feet, being the highest in the United Kingdom), Ben Mac Dhui (4327), Cairngorm (4095), Ben More (3870), Ben Wyvis (3720), and Ben Lomond (3262). The highest of the Pentland range is Carnethy (1880). Amongst the southern hills, few exceed 2500 feet.

GEOLOGICAL STRUCTURE.—SOIL.—CLIMATE.

In the Highlands, the rocks are generally of the primary kind—granite, gneiss, mica-slate, &c.; the granite generally rising into lofty peaks, on which, in many instances, gneiss and other non-fossiliferous rocks abut or rest. In the Lowlands, the rocks are generally of the transition kind (grawacke, &c.), covered in many parts with coal-measures, trap, and red sandstone. Rocks superior to the red sandstone occur only in a few detached places, and in very small quantity.

The coal-field of Scotland extends, with slight interruptions, across the central part of Scotland, from the eastern extremity of Fife to Girvan in Ayrshire; the principal beds being near Dysart and Alloa, in the vale of the Esk near Edinburgh, near the line of the Forth and Clyde Canal, at Paisley in Renfrewshire, and at Dalry, Kilmarnock, and Girvan, in Ayrshire. The Scottish coal is chiefly of a hard and lumpy kind, calculated to burn briskly, and therefore well adapted for manufacturing as well as for domestic purposes.

Granite is dug in the neighbourhood of Aberdeen, and at Kirkcudbright, for building purposes. The city of Aberdeen itself is chiefly constructed of it; and great quantities of it are transported to London, Liverpool, and other places, to be employed in building bridges, docks, and other structures in which unusual durability is required. Slates of excellent quality for roofing are quarried at Easdale and Ballahulish in Argyllshire, and in other places. Sandstone slabs for paving are quarried in Caithness, and at Arbroath in Forfarshire. A fine kind of sandstone is dug in many places, and is the primary cause of the architectural elegance of many of the public and private buildings in the principal towns. Owing to the abundance of both sandstone and trap, both of which are excellently adapted for building, little brick is used in Scotland.

The chief metals worked in Scotland are lead and iron. Lead is extensively wrought in the hills near the junction of Lanark and Dumfries shires, and silver was formerly obtained in considerable quantities in the same district. Iron has latterly been worked on a great scale in the northern district of Lanarkshire, and in the counties of Renfrew and Ayr. Agates, topazes, cornelians, and some other precious stones, are found in the highlands of Aberdeenshire. Mineral waters, useful for various maladies, exist at Dunse, Moffat, Innerleithen, Airthrey, Bridge of Earn, Peterhead, and Strathpeffer.

The soil of Scotland is of an extremely diversified character. On the comparatively level tracts, much is composed of loam resting on the great clay bed, or diluvium, or of alluvial clay washed down from the hills. Much level as well as hilly ground is also covered by peat bog, the dissolved forests of ancient times. On the trap hills, a light and useful soil, composed of the material below, is generally found. A considerable quantity of the arable soil throughout, being composed of reclaimed bog, contains a peaty material. Out of the thirty thousand square miles comprehended in Scotland, about thirteen thousand are totally incapable of improvement, nine thousand are wastes believed to be capable of improvement, and the remainder are pretty equal between arable and pasture land.

The climate, as compared with that of Er cold, cloudy, and wet; yet the temperature is to such great extremes as that of either Er France, seldom falling below 25° Fahrenheit, above 65°, the annual average being from 4 The summer is uncertain, and often comprehe consecutive weeks of ungenial weather; bu other hand, the winters are rarely severe, include many agreeable days and even wee backwardness of spring is perhaps the worst the meteorological character of the country.

ANIMAL AND VEGETABLE PRODUCTIONS.—AGRICI

The country, as already mentioned, was covered in great part by wood; and this feat lieved to have been expressed in its ancient na donia (*choille dun*, Gaelic, a wooded hilly coun natural wood has been allowed in the course go into decay, in all except a few remote di which we may particularise the high count junction of Aberdeen, Banff, Moray, and shires. In the last century, Scotland had becon bare of wood, the only patches being around ge seats. Within the last fifty years, this state has been greatly changed. Extensive plantat been formed in most districts, as a protecti cultivated lands. Those of the Duke of Athole shire are remarkable, above all, for the vast which they occupy. Scottish plantations consi of larch and fir; but the country also prod ash, and elm, in great abundance. It is calcu about a million of acres in Scotland are n wood.

Scotland formerly abounded in wild anima cularly the wild-boar, the wild-ox, and the w wild-boar has been for many ages extinct; wolf has been so since the latter part of the se century. Of the primitive white wild cattle of try, there is now only a specimen herd, preser curiosity in the parks near Hamilton Palace. prey, the eagle, falcon, and owl, are still foun Highlands and Western Islands, where also game birds are abundant. Aquatic birds h more precipitous shores in vast numbers. I rabbits every where abound, and foxes are n The rivers of Scotland produce salmon and t herrings, haddocks, cod, and flounders, exist abundance in the neighbouring seas.

Husbandry was in a very backward state in till the middle of the eighteenth century. T lands produced herds of the native small bla in the low countries, the higher grounds were as now, by flocks of sheep; but there was litt land, and that little was ill cultivated and comp unproductive. Since then, under the care o patriotic and enlightened individuals, Scotlan said to have been one great experimental far advancement of husbandry in all its forms. ing of turnips for the winter support of cattle in itself a most remarkable improvement. rotation of crops has been studied, and has tended with the best effects. Old, cumbrous, pensive modes of tillage have been banished, light plough and cart substituted in their place ing has improved not only the soil but the Lime, and latterly bone manure, have been ex introduced. The productiveness of the soil h quently increased in an immense ratio. Oats plant, calculated for most soils and climates, i chief grain raised in Scotland, and its meal i principal food of the peasantry, of working general, and of the children of all classes of munity: it is said to cover 1,260,000 acres, or of the whole in cultivation. Barley, which conspicuous article in the food of the comme and is also used in distillation, occupies 280,(Wheat is believed to occupy only about 140,0

of what is honourable in the doings of those who before them. A strong sense of religion is a com- ons feature in the Scottish national character; however, from all regard to external and what r to them unimportant things connected with it. is no country where a more decent attention is the Sabbath than in Scotland. It may at the time be remarked, that their religion is more doc- than directly veneralive or sentimental—a pecu- which may be traced in the plainness of their of worship, as either its cause or its effect. There considerable tendency in the Scottish intellect to mentative reasoning, and this shows itself in the e in their churches as well as in their philosophi- erature. The domestic virtues flourish in much me degree in Scotland as in England; but the er classes in North Britain are not nearly so re- able for cleanliness as the lower English, and they suffered of late years from the extensive use of spirits. The rural labouring classes are re- able for their steady industry and decent conduct; is only, perhaps, amongst the lower orders in towns, that much moral deterioration has taken

For centuries, the wandering disposition of the has been remarkable. An immense number of persons every year leave their native country to their fortune in the busier English cities, in public yment in India, in the colonies, or in other parts world. These persons have generally a tolerable tion in proportion to their rank and prospects; ing found possessed of steadiness, fidelity, and erance, they rarely fail to improve their circum- s. We are here reminded of the advantage which nd has long enjoyed in the possession of an uni- ly diffused means of elementary instruction. This, h in some respects over-estimated, has at least en- that nearly every person reared in Scotland is ithout some tincture of literature.

PROGRESS OF POPULATION.

population of Scotland, at the end of the seven- century, did not probably exceed a million. In when an attempt was first made to ascertain it, ears to have been about 1,265,380. From that the country made a start in manufacturing and ercial prosperity, as well as in improved modes ral husbandry, and the population experienced lingly a considerable increase, though not as great portion as the increase of wealth. The various s since 1801, inclusive, give the following re- —

01, - -	1,599,068	1821, - -	2,093,456
11, - -	1,805,688	1831, - -	2,365,114

crease has taken place chiefly in large towns, a of the progress of manufactures and commerce. ascertained that, of the total families in 1821, 9 were employed in agriculture, and 190,264 in manufactures, and handicrafts; leaving a re- der of 126,997 subsisting otherwise. Since then, proportion of the second class has probably expe- d a large increase. The progress of population otland has, according to Mr M'Culloch, "been han its progress during the same period in Eng- and Ireland; while there are good grounds for ng that the wealth of Scotland has increased more y than that of either of these two countries. This ble result," our author adds, "seems to have been principally to the consolidation of small farms low country, the introduction of sheep-farming he Highlands, and the obstacles imposed, by the Scotland as to leases and the operation of the aws, against the subdivision of land and the ng of superfluous cottages. These circumstances, ned with the moral and religious habits of the , and the general diffusion of education, have marriages be deferred to a later period than in parts of the empire, and have also led to a very ive emigration. * * In consequence, the

Scotch have advanced more rapidly than the English or Irish in wealth, and in the command of the necessaries and conveniencies of life. Their progress in this respect has, indeed, been quite astonishing. The habits, diet, dress, and other accommodations of the people, have been signally improved."*

It has been shown, on the other hand, that the comforts of the people have not every where improved in the ratio of the general advance of wealth. That operation of the limited poor-laws of Scotland which Mr M'Culloch eulogises, has been shown by Professor Alison of Edinburgh to send annually great numbers of superannuated labourers and others into the large towns, where they form a dense population, living in semi-destitution, and in other circumstances unfavourable to health, and are thus exposed to fevers and other contagious maladies, which periodically sweep them off in large numbers. It is contended by the same writer, that the low condition in which the scanty provision for pauperism compels many to live, gives them reckless habits, and tends materially to increase a mean, squalid, and dangerous population. There is certainly much truth in these views. The sanitory condition of Glasgow forms a startling illustration of them. During five years, from 1835 to 1839 inclusive, the number of fever cases treated at the public expense in that city was 55,949, or about 11,000 per annum, and the deaths in the same period were 4788. The population of Glasgow has risen from 151,540 in 1822, to 272,000 in 1840, and in that period the rate of mortality has been rapidly advancing. In 1822, the mortality was 3408, or one in about 44¼ of the population; in 1825, it was 4571, or as one in about 36¼. In 1828, the mortality increased to 5534, which, at the then amount of the population, was one in 33—a proportion alarmingly high. Since then, however, the inhabitants of this great city have suffered still more severely. In the year of the Asiatic cholera, 1832, when the population was 209,230, the mortality reached the enormous amount of 9654, or one in about 21¼; and again, in a year of severe fever (1837), when the population was estimated at 253,000, it reached 10,270, or one in about 24¼. It would appear as if, after such disastrous periods, the mortality becomes for some time lessened. After 1832, it rebounded to one in 36, and after 1837 to one in 37, or thereabouts. Probably this is in some measure owing to the effect of severe epidemics in carrying off so many of the least healthy of the people. It is to be remarked, that in these results no account is taken of still-born children, who, in the eighteen years before 1840, amounted to 8763. The proportion of the still-born is startlingly high, being, in 1830, 471 out of 6868, or about a fourteenth. In this fact alone, we cannot help thinking we behold a strong proof of the amount of misery and unfavourable modes of living prevailing in Glasgow.

The average annual mortality in Gl[illegible]gow, for the period between 1822 and 1830, both inclusive, one in 38¼; for the period between 1831 and 1839, also both inclusive, one in nearly 32. At the latter date, if it were habitual, Glasgow would stand forth as one of the cities most fatal to human life in Europe. Another fact is most remarkable, that, of the deaths during these eighteen years, 43 per cent., *or not much short of the one-half, are of children under five years of age, and* 18 *per cent. under one year of age.* It further appears, from minute evidence, that in the years of unusually great mortality, there is a larger proportion of deaths amongst the adult population, *showing how fatal the epidemics are to heads of families.* From one-fourth to one-fifth of the funerals in Glasgow are at the public expense—an impressive fact, seeing how it *connects poverty with mortality.*

REMARKABLE NATURAL SCENERY.—NATURAL CURIOSITIES.

The comparatively irregular surface of Scotland, or, as a geologist would remark, its being more generally formed of the primitive and early rocks, has en existence of much picturesque and romantic the attractions of wh have been greatly hel of late years by — of the native poets an ists, particularly . ter Scott. The Highla be said to [illegible] tract of such scenery some parts are considerably more beautiful tha Fine scenery in Scotland generally lies along of lakes or the vales of rivers. The chief tr the following:—

Lower Perthshire.

The Trosachs and Loch Katrine.—This is a h district, situated at the distance of little mo twenty-five miles from Stirling, and remarkabl scenery of Scott's *Lady of the Lake.* It may b commence at the large Lowland village of Ca which is only sixteen miles from Stirling. Thi lies in the bosom of the valley of the Teith, w hills on all sides except the east, and apparent pying the last patch of level ground before the t enters the Highlands. The surrounding scener thy of being explored; two places, in particular be visited. The first is the *Fall of Bracklin,* among the hills, at the distance of a mile an in a north-easterly direction from the villa consist of a series of cascades formed by the ous rushing of a mountain stream, termed the down a rugged rocky ravine. Each cascade eight to ten feet in depth, and altogether, t may measure upwards of a hundred feet, bef finally settle in a profound receptacle at the Above the chasm there is thrown a rustic foot from which the view of the falls, when the water is particularly grand. This spot is worthy o visited by geologists, on account of the singular of rifted rock over and among which the wate tuously dashes.

The other place to which we would draw atte the *Pass of Leny.* This is a narrow opening, mile to the north-west of the village, which affo cess, as its name imports, from the low country wild recesses of the Highlands. While the val Teith continues towards the west, the road to t of Leny strikes off in a north-westerly direction. with waving woods and bound in by lofty mou this is a scene of great sublimity. A rapid river issues from the mountain lake denominated Loc naig, hurries through the narrow vale over a s little cascades, yielding a music harsh and wild, keeping with the ruggedness of the scene. Th leads along the brink of Loch Lubnaig, to th parish village of Balquidder, where, in the chur the grave of the celebrated freebooter Rob Roy pointed out.

The road towards the Trosachs pursues a t line along the base of a mountain range, skirt north side of the valley. In the bottom of the in succession two long stripes of water, or lakes Loch Vennachar and Loch Achray. Immedia fore approaching the eastern extremity of the these lakes, which is by much the smallest, a ro off to the right, into the vale of *Glenfinlas*—a ten miles in extent, formerly a royal hunting destitute of the smallest symptom of habitatio cultivation, and which any one who wishes to complete idea of an Ossianic desert, in all its ste lonely wildness, may be recommended to traver bridge crossing the stream which descends fr vale, is called the Bridge of Turk, on account o boar, which had done much mischief in the nei hood, having been slain at the place in times l gone.

On coming to the head of Loch Achray, you a the Trosachs. At this point is situated an inn, a strange Gaelic name, sounding something li kencrockran. This is the last human habitatio route, and here travellers usually quit their veh order to walk the remainder of the distance; th

* Statistical Account of the British Empire.

, will accommodate a chaise to the verge of
atrine. The Trosachs is simply a concluding
f the vale, about a mile in extent, and adjoin-
e bottom of Loch Katrine. From the tumul-
nfusion of little rocky eminences, of all the
ntastic and extraordinary forms, which lie
ut the bottom of the vale, and are every
hagged with trees and shrubs, nature here
aspect of roughness and wildness, of tangled
tricable boskiness, totally unexampled. The
ing contracted, hills, moreover, rise on each
great height, which, being entirely covered by
hazels, oaks, hawthorns, and mountain ashes,
te greatly to the general effect. The meaning
ord *Trosachs* in some measure describes the
rough or *bristled* piece of territory. The
f the *Lady of the Lake* has described it as "a
scene of mountains, rocks, and woods, thrown
in disorderly groups."

termination of the Trosachs, Loch Katrine
es: it measures about ten miles in length, and
reckoned one of the most beautiful in Scot-
s principal charm consists in the singular
rildness of its mountainous sides, and its pretty
ets, rising to a considerable height out of the
d tufted over with trees and shrubs. Near
rn extremity of the lake, there is precisely
island as that which is described in the poem
idence of the outlawed Douglas and his family.
he wishes of the imagination—if such a phrase
used—Lady Willoughby D'Eresby, the pro-
of the ground, has erected upon the island a
ower or cottage, such as that which the said
cupied; and he must be a traveller of more
inary churlishness who could refrain from in-
n the pleasing deception thus created.
ew of the lake, on approaching it on the east,
confined, but from the top of the rocky and
ount above, the prospect is more extensive,
at singular beauty which the author of the
the Lake has described in the following pas-

——— "Gleaming with the setting sun,
e burnish'd sheet of living gold,
ch Katrine lay beneath him roll'd,
all her length far-winding lay,
ith promontory, creek, and bay,
d islands that, empurpled bright,
ated amid the livelier light,
d mountains that like giants stand,
sentinel enchanted land.
gh on the south, huge Ben-venue
ern on the lake its masses threw—
ags, knolls, and mounds, confusedly hurl'd,
e fragments of an earlier world;
wildering forest feather'd o'er,
s ruin'd sides and summit hoar;
hile on the north, through middle air,
n-an heaved high his forehead bare."

ern.—The beautiful scenery connected with
may be said to commence at Comrie, a village
nty miles to the west of Perth, and remark-
e place of all others in the United Kingdom
rthquakes take place most frequently. The
e Earn is here, and even lower down, full of
d acquired beauty. Passing upwards towards
he scenery becomes more interesting at every
that part of the vale which adjoins to the
the lake, its character is similar to that of
che, at the corresponding extremity of Loch
hough less minutely rugged and picturesque.
rough the extensive grove at the bottom of
, now within sight and hearing of the ever-
nd ever-murmuring Earn, and then beyond
the road approaches and recedes from the
, the traveller gets frequent broken glimpses
nd and wildly serrated tops of the neighbour-
ains, whose sides present a strange piebald
by no means deficient in effect, of alternate
bare crag and incumbent verdure—a beautiful confu-
sion, indeed, of grey and green—relieved occasionally
by the darker branches of the birch and weeping-ash.

Loch Earn extends nine miles in length, and gene-
rally about one mile in breadth. It is thus described
by Dr M'Culloch:—"Limited as are the dimensions of
Loch Earn, it is exceeded in beauty by few of our lakes,
as far as it is possible for many beauties to exist in so
small a space. I will not say that it presents a great
number of distinct landscapes adapted for the pencil;
but such as it does possess, are remarkable for their
consistency of character, and for a combination of
sweetness and simplicity, with a grandeur of manner,
scarcely to be expected within such narrow bounds.
Its style is that of a lake of far greater dimensions; the
hills which bound it being lofty, and bold, and rugged,
with a variety of character not found in many of even
far greater magnitude and extent. It is a miniature
and model of scenery that might well occupy ten times
the space. Yet the eye does not feel this. There is
nothing trifling or small in the details; nothing to di-
minish its grandeur of style, and tell us we are contem-
plating a reduced copy. On the contrary, there is a
perpetual contest between our impressions and our
reasonings: we know that a few short miles compre-
hend the whole, and yet we feel as if it were a landscape
of many miles—a lake to be ranked among those of first
order and dimensions. While its mountains thus rise
in majestic simplicity to the sky, terminating in bold,
and various, and rocky outlines, the surfaces of the de-
clivities are equally bold and various; enriched with
precipices and masses of protruding rock, with deep
hollows and ravines, and with the courses of innumer-
able torrents which pour from above, and, as they de-
scend, become skirted with trees till they lose them-
selves in the waters of the lake. Wild woods also
ascend along their surface, in all that irregularity of
distribution so peculiar to these rocky mountains; less
solid and continuous than at Loch Lomond; less scat-
tered and romantic than at Loch Katrine, but, from
these very causes, aiding to confer upon Loch Earn a
character entirely its own." In passing along Loch
Earn, it is recommended to go by the road on the south
side. The house of Ardvoirdlich (Stewart, Esq.), occurs
about mid-way; its name recals the memory of Stewart
of Ardvoirdlich, a partisan of Montrose, who killed his
friend Lord Kilpont in the royalist camp at Collace,
September 5, 1644—the incident on which Scott founded
his *Legend of Montrose*. The woody promontories which
here project into the lake are remarkably beautiful.
About a mile and a half from the west end of the lake,
occur the castle and falls of Edinample, a scene of dis-
tinguished loveliness, such as people, in the spirit of
compliment, say, might give occasion to a volume, and
which, rather strange to tell, has actually done so.

The upper extremity of this beautiful lake, where the
general [illegible] the scenery may be said in some mea-
sure to be altogether condensed and combined, is enliv-
ened by the little village and inn of Loch Earn Head.

Middle Perthshire.

Dunkeld.—This small town, so celebrated for the
fine scenery in its neighbourhood, is situated on the
north bank of the Tay, at the distance of fifteen miles
from Perth and twenty-four from Kenmore. Nestling
beneath steep and woody mountains, with a noble river
running in front, across which there is an elegant
bridge, the first view of Dunkeld, in approaching it
from the south, is very striking. The village consists
of two small streets, in which are two excellent inns,
affording extensive accommodation for the tourists who
flock hither in summer. At Dunkeld, attention is called
to the venerable remains of a cathedral, and the Duke
of Athole's mansion, styled Dunkeld House; but our pre-
sent business is with the natural scenery. Most of this
is in the pleasure-grounds connected with the mansion.

Craig-y-Barns, a lofty hill, wooded to the top, which
rises behind the house, is a resort of tourists for the
sake of the magnificent view which it commands. They

are also conducted by guides to the scenery of the *Bran*, which joins the Tay on its opposite bank near the village of Inver—the birthplace and usual residence, it may be mentioned, of the late Neil Gow, so famous wherever Scottish music is known, at once for his performance on the violin and his excellent compositions. Near this place the tourist is conducted into a tasteful hermitage or summer-house, named Ossian's Hall, where he sees before him a picture representing the aged Ossian singing to some females the tales "of the days that are past," while his dog, his hunting-spear, and bow and arrows, lie at his side. On a sudden, this picture slips aside, and discloses to the view of the surprised stranger a splendid cataract, which dashes down the rocks immediately opposite to the building, and the waters of which are reflected from a range of mirrors disposed around the hall. To use the words of Dr Clarke, "The whole cataract foams at once before you, roaring with the noise of thunder. It is hardly possible to conceive a spectacle more striking. If it be objected that machinery contrivance of this sort wears too much the appearance of scenic representation, I should reply, that as scenic representation I admire it, and as the finest specimen of that species of exhibition; which, doubtless, without the aid of such a deception, would have been destitute of half the effect it is now calculated to produce. A little below this edifice, a simple but pleasing arch is thrown across the narrow chasm of the rocks, through which the river flows with vast rapidity. About a mile higher up the Bran, is the *Rumbling Bridge*, thrown across a chasm of granite, about fifteen feet wide. The bed of the river, for several hundred feet above the arch, is copiously charged with massive fragments of rock, over which the river foams and roars like the waters at Ivy Bridge in Devonshire. Approaching the bridge, it precipitates itself with great fury through the chasm, casting a thick cloud of spray or vapour high above the bridge, and agitating by its fury even the prodigious masses which form the surrounding rocks. Few objects will more amply repay the traveller for his trouble of visiting them, than the woody precipices, the long, winding, shady groves, the ruins, and cataracts of Dunkeld."

In the angle formed by the junction of the Bran and Tay rises *Craig Vinean*, a broad shadowy mass of firs, reared against the sky. A neighbouring eminence obtains the name of the *King's Seat*, in consequence of King William the Lion having been in the habit of stationing himself upon it, in order to shoot at the droves of deer which his attendants caused to pass through the adjacent hollows. It is related that Queen Mary also practised the same sport at this place, and on one occasion narrowly escaped destruction from an infuriated stag.

Aberfeldy, Kenmore, and *Killin*.—Tourists frequently proceed from Dunkeld along the banks of the Tay, in order to comprehend the tract of scenery here indicated. *Aberfeldy*, a village not in itself remarkable, is celebrated for the fine cataract, formed by a small tributary of the Tay, in its neighbourhood, and near the house of Moness. The tourist is conducted by a guide along the thickly wooded banks of this rivulet, till, about a mile from the village, he reaches the first of the celebrated waterfalls of Moness. A little sub-tributary rill here pours, in a series of cascades, down the side of the glen, amidst a natural scene of the greatest beauty. A little farther up the main dell, the rivulet pours along a steep natural staircase, of a hundred feet in perpendicular descent, the sides of which rise abruptly and ruggedly, clothed with the most beautiful natural plants. This scene is described by Burns in one of his songs :—

"The braes ascend like lofty wa's,
The foaming stream deep roaring fa's,
O'erhung wi' fragrant spreading shaws,
The birks of Aberfeldy.
The hoary cliffs are crown'd wi' flowers;
White o'er the linn the burnie pours,
And, rising, weets wi' misty showers,
The birks of Aberfeldy."

At a t[illegible] her up, the pathway [illegible] on the other side [illegible] Moness Falls as "an [illegible] be admired in the [illegible]

A ride of six miles along the Tay brings th[illegible] to *Kenmore*, a village of famed beauty, situ[illegible] east end of Loch Tay, at the place where [illegible] issues from that sheet of water. This is one [illegible] stages, or *points*, in the tour of Perthshire [illegible] provided, accordingly, with a good inn. [illegible] ascend on each side; on one hand there is a r[illegible] on the other, towards Aberfeldy, stretch th[illegible] grounds around Taymouth Castle, the seat o[illegible] quis of Breadalbane. This magnificent ho[illegible] worthy of the great chief and land-proprietor [illegible] it—is about a mile to the east of Kenmore, t[illegible] gateway of the park opening from the street [illegible] lage. It is a dark grey castellated edifice, [illegible] aspect, situated in the low ground beside the [illegible] a beautiful backing of woody hills rising behi[illegible] princely place and its adjuncts made a deep i[illegible] on the mind of Burns, who visited it in 1787 [illegible] described it:—

"The outstretching lake, embosomed 'mong the h[illegible]
The eye with wonder and amusement fills;
The Tay, meandering sweet, in infant pride;
The palace rising by his verdant side;
The lawns, wood-fringed, in nature's native tast[illegible]
The hillocks dropp'd in nature's careless haste;
The arches striding o'er the new-born stream;
The village glittering in the noon-tide beam."

A guide is required to introduce a stranger [illegible] beauties of the Taymouth Park, among whic[illegible] remarkable is the *Beroean Walk*, a grand [illegible] four hundred and fifty yards in length, whic[illegible] one of some lofty cathedral, "casting a dim [illegible] light."

Loch Tay is a fine sheet of water, fifteen [illegible] length, lying between two ranges of hills. In t[illegible] of the north-west side rises *Ben Lawers*, to t[illegible] of 4015 feet. An island near Kenmore foru[illegible] tained a priory of Augustines, founded by Ale[illegible] in the year 1122. Here his queen, Sybilla, da[illegible] Henry I. of England, was buried. Loch Tay i[illegible] able, like some other Scottish lakes, for hav[illegible] on several occasions, greatly agitated at the n[illegible] the occurrence of earthquakes in distant pa[illegible] world. It is from fifteen to a hundred fath[illegible] There is a road on each side to Killin, the[illegible] being sixteen miles. Both abound alike in fin[illegible] though, by pursuing that along the south si[illegible] will be obtained of the lofty Ben Lawers, [illegible] scarcely be seen in such perfection on the [illegible] side. The mixture of wood, rock, and cultiv[illegible] which the traveller finds skirting Loch Tay, [illegible] prise him with its happy effect. The old [illegible] minute farms prevails here in all its pristin[illegible] and a prodigious number of rude and picture[illegible] tages necessarily enter into the compositio[illegible] landscape.

Killin, a straggling little village, situated i[illegible] vale at the head of the loch, is celebrated for t[illegible] beauty of its scenery. Here two rivers, the [illegible] and the Lochy, come down out of different g[illegible] join their waters with each other and with [illegible] The vale of the latter is peculiarly beautiful; [illegible] of the Dochart, extending up to Tyndrum, [illegible] great west road, is only stern and wild. On [illegible] at the town, the Dochart breaks over a strang[illegible] of table rock in a thousand little cascades, a[illegible] traveller, who crosses a bridge just at the [illegible] bewildered, as he looks around, with the flas[illegible] sparkling water which every where meets his [illegible]

"Killin," says Dr M'Culloch, "is the most [illegible] dinary collection of extraordinary scenery in [illegible] unlike every thing else in the country, and [illegible] on earth, and a perfect picture-gallery in its[illegible] you cannot move three yards without meetin[illegible]

e. A busy artist might here draw a month, and
ust it. It is indeed scarcely possible to conceive
distinct and marked objects collected within
a space, and all so adapted to each other as
o preserve one character, and, at the same
produce so endless a number of distinct and
landscapes. To find, however, all that Killin
ive of this nature, it is necessary to pry about
ners, like a cat; as the separate scenes are pro-
very slight changes of position, and are often
very unexpected places. Fir-trees, rocks, tor-
ills, bridges, houses—these produce the great
the middle landscape, under endless combina-
hile the distances more constantly are found
urrounding hills, in the varied woods, in the
xpanse of the lake, and the minute ornaments
istant valley, in the rocky and bold summit of
illeach, and in the lofty vision of Ben Lawers,
wers like a huge giant to the clouds, the mo-

atic fortress, noted in Scottish history, and one
kept in repair in terms of the Act of Union.
the town of Dunbarton, the tourist proceeds
along the vale of the Leven, a scene of singu-
ity, filled with thriving villages and elegant
es. The road, at the distance of two miles from
n, passes the old mansion-house of Dalquharn,
ch, in the year 1721, the author of Roderick
n first saw the light. Archibald Smollett, the
of the novelist, was the fourth son of Sir James
t of Bonhill, and, having married against his
s will, was residing here, in possession of one of
me of the family property, at the time of the
f his illustrious child. In a field on the opposite
side of the road, there is an obelisk to the me-
f the novelist, erected and inscribed by his cou-
man, James Smollett of Bonhill. Immediately
, the road passes through the populous modern
of Renton, occupied by persons engaged in the
ring bleachfields, and taking its name from
a lady married into the Smollett family. This,
other similar village named Alexandria, a little
on, together with the appearance of various
on a large scale scattered over the landscape,
that industry of a different kind from that which
n "embrowned with toil," has taken possession
impid waters of the Leven, to which, therefore,
utiful ode of Smollett is no longer strictly appli-
Bonhill, the ancient seat of the novelist's family,
ite to Alexandria. Several other mansions of
handsome appearance enliven the road before it arrives at *Balloch* (town at the foot of the lake), a small village and inn at the southern extremity of Loch Lomond, four and a quarter miles from Dunbarton. From this place a steamer, on earth at least "yclept Euphrosyne," starts every morning to conduct tourists along the lake.

Loch Lomond measures twenty-three miles in length from north to south; its breadth, where greatest, at the southern extremity, is five miles, from which it gradually grows narrower between the enclosing hills, till it terminates in a mountain streamlet. The whole aqueous surface is calculated at 31½ square miles, or 20,000 English acres, and it is studded by above thirty isles, mostly at the southern extremity. These islands, together with the shores of the lake, are in general clothed with dark wood, which gave occasion to a distinction very judiciously drawn a few years ago by a Swiss tourist between Lausanne and Loch Lomond: "Our lake" he said, "is the fair beauty—yours the black." The first isle that occurs is a long narrow one named *Inch Murrin*, at the southern extremity of which there is an old ruined fortalice, called Lennox Castle, said to have formerly been a residence of the Earls of Lennox. This isle is now the property of the Duke of Montrose, who employs it for the keeping of deer. In succession from Inch Murrin, towards the north-east, occur *Inch Cro* (the isle of cattle), *Torr Inch* (the wood isle), and *Inch Caillach* (the island of women, having been the site of a nunnery). On the south side of Inch Caillach, is *Clar Inch* (flat island), a very little member of the archipelago; at the north end the ruins of a castle are to be seen under water, testifying that the surface of the lake must have risen in the course of ages. Inch Caillach, which formerly gave name to the parish of Buchanan, and was the burial-place of the Macgregors, has on its north side *Inch Fadd* (long island), which bears grain and pasture, and near which is *Ellendarroch* (the small rugged island). Another group, to the northward, stretch between the peninsula of Rossdoe, on the west side of the lake, and Strathcashel Point, on the east. *Inch Tavanagh*, the first in this group, and which derives its name from having once been the residence of a monk, contains 150 acres, partly covered with wood; it is the highest island in the lake. At a little distance to the south, the ruins of Galbraith Castle, once the residence of a family of that name, start up from the water. To the east of Inch Tavanagh are *Inch Conagan*, covered with oak and fir, and *Inch Moan*, a low isle correctly described by its name, which signifies the island of moss. Still farther to the east are *Inch Cruin*, on which is an asylum for insane persons, and *Buc-inch* (goat-island). North from these lies *Inch Lonaig*, 150 acres in extent, and bearing many old yews, formerly of great use in furnishing the materials of bows and arrows. Of the whole thirty islands, the remainder are unimportant. South of Luss, the depth of the lake is rarely more than 20 fathoms: in the northern and narrower part it ranges from 60 to 100 fathoms; and in the places where deepest never freezes. In ancient times, Loch Lomond was famed for three wonders—"waves without winds, fish without fins, and a floating island." The first phenomenon is attributed to a peculiar atmospheric effect, not easily described, but which has also been observed on the Cumberland lakes; vipers swimming from island to island account for the second; the floating island is supposed to have been a detached fragment of moss, or a matted mass of aquatic plants, which ultimately fixed itself near the west side of Inch Conagan. The lake abounds in delicious fish.

Loch Lomond is skirted on the west side by the road from Dunbarton to Inverary. Less than a mile from the lower end of the lake, this road passes Cameron House, long the seat of the Smolletts of Bonhill, and described as such in the novel of *Humphry Clinker*, where we have many panegyrics upon its scenery. A little farther on, the fine modern mansion of Belretiro overhangs the road upon the left. Here, through a fine vista, appears the polished expanse of Loch Lomond,

its large islands, and the soft hills in the distance—a view that never fails to arrest the attention of the traveller. The objects that crowd into this scene are so finely diversified in form, in situation, and in colour, as to compose a picture at once beautiful and impressive. At the seventh mile-stone, upon the left, is Arden, the property of H. Buchanan, Esq., environed with woods, and placed at the bottom of a lofty hill, called *Dunfion*, or the hill of Fingal, tradition reporting it to have been one of the hunting seats of that hero. Somewhat farther on, and passing Nether Ross upon the left, the traveller crosses a small river called the Water of Fruin, which falls into the lake. It rises in *Glenfruin*, or Vale of Lamentation, so called, it is said, from a dreadful slaughter of the Colquhouns by the Macgregors, in 1602, and on account of which the Macgregors were, for nearly two centuries, unceasingly persecuted by government. The promontory of *Rossdoc*, which forms a beautiful situation for the mansion of the same name (Colquhoun of Luss, Bart.), is then passed; after which a scene of uninterrupted beauty continues all the way to Luss, twelve miles from Dunbarton.

Luss, a delightful little village, on a promontory which juts into the lake, is much resorted to in summer, on account of its being a convenient station for tourists in search of the picturesque. One of the finest points for enjoying the scenery of Loch Lomond and the environs of Luss, is Stronehill, to the north of the village. At this point, about one-third of the way up a lofty hill, the whole breadth of the lake is spanned by the eye, including

> ——"all the fairy crowds
> Of islands which together lie,
> As quietly as spots of sky
> Among the evening clouds."

From this point, the isles appear distinctly separated from each other, but not so much so as to give the idea of a map or bird-eye view, which a higher point of view would undoubtedly present. The prospect is bounded on the south by the distant hills which intervene between Loch Lomond and the Clyde, and which here appear, in comparison with the mountains around, to be only gentle swells; the Leven, its vale, the rock of Dunbarton, and even the surface of the Clyde, are in the same direction conspicuous. Towards the east, the vale of the Endrick, its principal seats, the obelisk erected to the memory of Buchanan at Killearn, and the Lennox hills, are also distinctly visible. Turning to the north, the lake is seen to wind far away among the mountains.

At *Inveruglas*, three and a half miles beyond Luss, there is a ferry to Rowardennan Inn, the usual starting-point for those who desire to ascend to the top of *Ben Lomond*. This mountain, situated in the county of Stirling, is 3240 feet above the level of the lake, which is 22 above the level of the sea. At Rowardennan, when looking northward, it almost completely fills up the view. It consists in three great stages, each rising above the other; these again are divided into a number of lesser swelling knolls, some of which are covered with heath and crags, while others are verdant and smooth. The distance from the inn to the top of the mountain is six miles of a continued ascent, which, in general, requires about three hours. From the summit, a varied and most extensive prospect opens upon the eye in every direction. The lake, lately contemplated with so much pleasure, now appears a small pool, and its rich and diversified islands as so many specks upon its surface. Beyond it, and to the left, appear the vale of the Endrick, the distant county of Lanark, its towns, and the mountain of Tinto; directly south, the outlet of the lake, the River Leven, its winding and rich banks, the Castle of Dunbarton, and the counties of Renfrew and Ayr; nearly in the same direction, the Firth of Clyde, the rock of Ailsa, the islands of Arran and Bute, with the more distant Atlantic. The coasts of Ireland and the Isle of Man are, when the atmosphere is clear, within the boundary of *the view*. *To the east* are seen the counties of Stirling and the Lothians, with the windings of the Forth the Castles of Stirling and Edinburgh. The pr to the north is marked by grandeur alone. Im mountains, piled as it were above each other, a tending from the borders of Stirlingshire to the w ocean, with the indentations of the coast on on and the lakes of Perthshire on the other, form gether a scene which may be conceived, but can properly described.

Ben Lomond has this remarkable advantage as that it is not overcrowned or crowded up with surr ing hills. It seems to be sole monarch of a vast puted territory. Nowhere, therefore, is there a idea to be obtained of the Highland country than summit. The mountain itself, besides, affords a variety of scenery. To the south it stretches ou a slope of a very gentle declivity. The north awfully abrupt, and presents a concave precip many hundred yards in depth. He must posses nerves who can approach the brink and look dow moved. The rock is said to be 2000 feet in she scent.

About four and a half miles to the north of In glas, the Dunbarton and Inverary road reache lonely but comfortable inn of Tarbert, where th also a ferry by which Ben Lomond may be appro At this inn the road leaves the shore of the lake proceeds to the westward by the head of Loch and so into Argyllshire. At Inversnaid Mill, th a little cataract, the scene alluded to by Wordswo his address to a Highland girl—

> "Sweet Highland girl! a very shower
> Of beauty is thy earthly dower."

On the heights above, beside the way to Loch Ka are the remains of Inversnaid Fort, erected by th vernment in 1713 to check the turbulence of the gregors: near it is a little burial-ground, in whic garrison had interred their dead, and containin or two monuments, which have long forgot to te familiar tale confided to them. The fort was tak Rob Roy in 1716, but afterwards regained and re blished. It is said that the amiable General Wo one time resided in it.*

Firth of Clyde.—Argyllshire.

This is a tract of scenery much admired and vi on account of its presenting a fine combination land seas with islands of varied surface and cha rugged mountains.

The Clyde expands into an estuary a little way Dunbarton. There, while the comparatively low of Renfrewshire, with the thriving towns of Port- gow and Greenock, are seen on the left, attent called on the right to the towering alps of Argyll sometimes ironically called the Duke of Argyll's ing-Green. The Argyllshire shores are here dec with a long succession of villas, the favourite su residences of the more affluent citizens of Gla This mountainous region is penetrated by several of the sea, one of which, named Loch Long, is tw

* "On the east shore of Loch Lomond, and the west Ben Lomond, or what is called *Craigrostan*, a narrow alpi conducts through scenery of gigantic features. Here tra countenanced by Barbour, has assigned to Robert Bruce in which he sojourned a night when passing from Strat after the nearly fatal combat with Macdougal of Lorn. to a steep shelving rock is pointed out as what is calle *Roy's Prison*,' where that Highland laird is reported to have such of his vassals as he had adjudged to durance. One tenants had not paid his rent when it became due. Rob, s ing him on a rope by the shoulders, let him down into the fa Having drawn him up at the end of twenty-four hours, him that, if he failed to pay by a particular time, he shou him up by the neck. North of Craigrostan is what is said been used by him as his cave. It is a rude subterraneous formed by a huge avalanche of the mountain. Here, acc to tradition, he rendezvoused with his followers."—*Sc Edition of Nimmo's Stirlingshire.*

Loch Leven, a road opens up a splendid tract of ntain scenery, the most striking being compre- hel in the valley of Glencoe. Another road, pro- ing in a northerly direction, leads to Loch Awe, an d lake possessing many fine features, and upon h stands the ruined castle of Kilchurn, once the f stronghold of the Breadalbane family. The loch erhung by Ben Cruachan, a mountain 3390 feet in ht, on the skirts of which King Robert Bruce gained tory over his powerful enemy, the Lord of Lorn. he northern portion of Argyllshire, where it is ded by the western ocean and its many inlets, rou- s much fine scenery. In a sheltered situation on the coast, stands the neat and cheerful town of Oban, nt of rendezvous for the numerous steamers pur- ting these seas, and a kind of entrepôt for the rural luce of the wide district around it. In front is the of Kerrera, where Alexander II. died in the course n expedition to the western islands. On the coast, dle to the north of Oban, is Dunolly Castle, the sion of the Macdougals of Lorn, and a little way ther north is Dunstaffnage, an ancient seat of the donian kings, occupying a commanding site on the of a rock overlooking the sea.

och Linnhe, opening between Lorn and Morven, the commencement of the chain of salt and fresh r lakes formed into the Caledonian Canal, presents oth sides scenery of a most romantic character—a ture of bold rocky forelands, on many of which are shed the eyrie-like fortresses of the rude chiefs of idden time, and green smiling hollows, within bays, re the elegant habitations of a modern gentry have placed. The long island of Lismore, in the mouth its estuary, was the ancient appanage of the bishops Argyll, and temporarily the site of a college for olic priests, after the French seminaries were closed he Revolution; but is now only remarkable for the t quantity of limestone exported from it. Opposite s upper extremity, Loch Creran, a sub-estuary, nches off into the land of Lorn, opening up much utiful scenery. On the south shore of Loch Linnhe, e north of the opening of Loch Creran, is the dis- of Appin, previous to 1765 the property of a race of Stuarts, descended from a natural son of the last Lord n, and for four centuries conspicuous in Highland ory. In this district, the first mansion which occurs e north of Loch Creran is Airds, the seat of Sir n Campbell. Next is the ruin of Castle Stalker, an ent massive building. Appin House, the seat of Downie of Appin, next occurs; and after that, at the th of Loch Leven, Ardshiel (Stewart, Esq.) From allachulish Ferry on Loch Leven, noted for its great rry of slate, the west Highland road penetrates the ge vale of Glencoe.

Glencoe opens a little to the north of a solitary inn d the King's House, and extends about ten miles north-westerly direction to Ballachulish. It may described as a narrow strip of rugged territory, g which hurries the wild stream of Cona, celebrated Ossian, who is said to have been born on its banks. ach side of the narrow banks of this river, a range tupendous hills shoots perpendicularly up to the ht of at least 2000 feet, casting a horrid gloom over vale, and impressing the lonely traveller with feel- of awe and wonder. The military road sweeps g the right side of the glen. From the sides of the an immense number of torrents descend, sometimes ping over and spoiling the road, which is always, efore, in a very precarious state. From the one of the vale to the other, only one human habita- is to be seen; and as it is not a road of much cur- y, the traveller may pass through it without meet- a single human being. The goats scrambling among rocks, and the wild eagle hovering about the tops e wall-like hills, are usually the only living objects in sight; and, as may be conceived, these rather ease than diminish the wildness and desolation of scene. The place where the famous massacre of coe happened, is at the north-west end of the vale.

Inverness-shire.—The Great Glen.

Between Loch Linnhe on the west coast and a point on the Moray Firth near Inverness, there is a remarkable natural phenomenon, in the form of a glen or hollow, passing in a perfectly straight line for sixty miles through a mountainous region, and the bottom of which is nowhere more than ninety feet elevated above the level of the sea. It is called by the Highlanders *Glenmore-nan-Albin* (the Great Glen of Scotland). A chain of lakes extending along this extraordinary hollow suggested the formation of a canal which should admit of navigation between the seas on the two sides of the island, and save the dangerous passage round by the Pentland Firth; and this, under the name of the *Caledonian Canal*, was formed between 1803 and 1822, under the care of Mr Telford, at an expense of £800,000. This line of communication has not proved so useful as was contemplated; but, by admitting of a line of steamers between Inverness and Glasgow, it has been the means of allowing a vast number of persons to enjoy the magnificent scenery through which it passes.

The canal commences at Clachnaharry, in the outskirts of the town of Inverness, and, after six miles, enters the first of the chain of lakes, *Loch Ness*, a grand piece of water, twenty-three miles long, situated amidst stupendous and sterile mountains. The waters of Loch Ness never freeze, but they are often agitated simultaneously with the occurrence of earthquakes in distant parts of the world. On an elevated rock projected into the north-east margin of Loch Ness, are situated the remains of Urquhart Castle, consisting of a great square keep and several exterior walls of defence. It was besieged in 1303 by the officers of Edward I., and with great difficulty taken; it afterwards was a royal fortress; and, finally, in 1509, it became the property of Grant of Grant, ancestor of the Earl of Seafield, to whom it now belongs. Glen Urquhart, which recedes behind Urquhart Castle, is a beautiful Highland vale, sometimes likened to Tempe, and containing many gentlemen's seats and a good inn. The conspicuous mountain, *Mealfourvonie* (hill of the cold moor), upwards of 3000 feet in height, here begins to raise its huge bulk above the banks of the loch. About 500 feet from the summit, there is a lake about a mile long, which cannot be much less than 3000 feet above the level of Loch Ness. On the top of the hill there is a cairn, the accumulation of which must have been a work of great labour. Mealfourvonie stands so prominently above the neighbouring herd of hills, that it is not only singled out by the eye at Inverness, but is the first landmark seen on entering the Moray Firth, at the distance of a hundred miles.

The road along the south side of Loch Ness, though it presents numberless fine views, is enlivened by few traces of man's presence. The paucity of houses gives a sort of distinction to the inn named General's Hut, nearly eighteen miles from Inverness, originally the residence of General Wade, while superintending the formation of his roads. Little more than a mile farther on, a recess or chasm in the hill by the side of the lake contains the celebrated *Fall of Fyers*. At the bottom of the recess there is a smooth little plain, descending upon the lake, ornamented by the house and shrubberies of Fyers, and where the steamers usually disembark such passengers as may desire to behold the waterfall. A path accessible to carriages, winds backwards and forwards, up the face of the hill, till the height of the public road is reached; and then there is a pathway leading down the face of the crags, towards a projecting rock, on which visiters usually stand to see the fall. The Fyers is not a very copious stream, except in rainy weather; consequently there are great variations in the aspect of the cascade. In its medium fullness, it pours through a narrow gullet in the rock, in a round unbroken stream, which gradually whitens, as it descends, till it falls into a half-seen profound, usually described as two hundred and forty feet below the point of descent, though this is supposed to be an exaggeration. A dense mist is constant rising from the broken water, like the heavenw pirations of an afflicted and tortured spirit. Th is usually very loud. About a quarter of a mile up the ravine, there is another cascade, usuall the Upper Fall—a fearful gulf, down which th descends by three leaps, and over which a bri been thrown, by way of station for a sight of t ract. All this stupendous ravine is covered by on whose every leaf a pearl of vapoury dew is co hanging.

A few miles farther on, *Glenmorrison* open the north-west bank of Loch Ness. It is a va of romantic scenery, and belongs to a branch family of Grant. While the steam-borne trave cessarily pursues the route by the lake, the t by the south road, after passing Fyers, leaves th of that piece of water, and advances into *Strat* a long valley behind the line of hills which c Loch Ness. A secluded valley, called Killean, upon this part of the road near Whitebridge, is of as a singularly secluded and romantic piece of At the distance of thirty-two miles from Inver road descends upon Fort Augustus and the litt of Killicumming, so called as the burying-plac C mings, lords of Badenoch.

rt Augustus, situated in a pleasant opening the hills, at the termination of Loch Ness, was in 1730, as an addition to the means previously for the control of the turbulent children of the tains. Its purposes being long since accompli has for many years been only occupied by two artillerymen. From Fort Augustus, the cut of t is resumed, and several locks are ascended; a miles brings it to *Loch Oich*, the smallest of th of lakes. The scenery is here finer than at an part of the Great Glen. On the north-west ban loch is Invergarry, till a recent period the resid the chief of Glengarry, a handsome modern h in the immediate neighbourhood of an older m which has been in ruins since burnt down by th troops in 1746, in consequence of the part taken chief in the rebellion.

The next and last loch is *Loch Lochy*, the h vironing which are the most hopelessly wild a pendous of all in the glen. The summit level canal is between Loch Oich and Loch Lochy ninety feet above the ordinary high-water mark William, and ninety-four above that at Inver difference to be accounted for by the pressure Atlantic on the west shores of Scotland. The little inn of Letter Findlay is the only house seen on Loch Lochy; but when the west end is reached, the traveller discovers, in a recess right side, the house of Auchnacarrie, which residence of the gallant and unfortunate Locheil he entered upon the fatal campaign of 1745. The after leaving this loch, descends in a precipitous of locks, called *Neptune's Staircase*, into Loch continuation of Loch Linnhe, the arm of the merly mentioned.

At this point the glen is more spacious th where else. It is, however, the spaciousness of The River Lochy, which issues from the lake same name, pours its voluminous and impetuous towards Loch Eil on the left; and beyond it Ben is seen to rear his enormous head, with the Glen Nevis withdrawing from his mighty side i solitudes of Lochaber. At the distance of little than a mile is the town of Fort William, so calle a fortress of the same name built for the repres Highland turbulence, and now nearly disused.

A cluster of glens to the south of the Great G remarkable for a natural phenomenon, usually the Parallel Roads of *Glenroy*, such being the n the vale in which the wonder is most conspic marked. It consists of a set of terraces, in most three in number, extending along both sides of vales for miles, the uppermost 82 feet abo

second, which, again, is 212 feet above the first. The common people represent these terraces as roads formed at the command of Fingal, an early hero, for his convenience in hunting; but they are in reality ancient beaches of inland seas, raised into their present position by successive upheavals of the land—phenomena with which modern geologists are familiar.

Western Islands.

The Western Islands are generally bleak and rugged in surface, and occupied by a very poor class of tenantry. In some of them, particularly Skye and Eigg, the scenery attains to a savage grandeur. It is not possible here to present a particular description of any besides the Isle of *Staffa*, so remarkable for its basaltic structure. It is about a mile and a half in circumference, and bears no human habitation, its only useful tenants being a small herd of black cattle. At the point of greatest elevation, towards the south-west, this island is 144 feet high. On the north-east it presents a face of somewhat less height, composed of basaltic columns, and penetrated by several caves of various sizes, into which the sea occasionally breaks with the report of thunder. This face, according to Dr Macculloch, is formed of three distinct beds of rock, of unequal thickness, inclined towards the east in an angle of about nine degrees: the lowest is a rude trap tufa; the middle one is divided into columns placed vertically to the planes of the lowest bed; and the uppermost is an irregular mixture of small columns and shapeless rock—the whole being partially covered by a fine verdure. The central columnar part having in some places given way, is the occasion of the numerous caves by which the island seems perforated.

Fingal's Cave, Isle of Staffa.

At the north-east point of the island, the dipping of the rocks is so low as to afford a safe landing-place at any time of the tide. Proceeding thence, the visiter is conducted along the north-east face, and is introduced to the *Clam-shell* (Scallop) *Cave*, where a curious confusion in the columnar structure is observable. The columns on one side are bent, so as to form a series of ribs not unlike the inside view of the timbers of a ship; while the opposite wall is formed by the ends of columns, bearing a general resemblance to the surface of a honeycomb. This cave is 30 feet in height, and 16 or 18 in breadth at the entrance; its length being 130 feet, and the breadth contracting to the termination. Next occurs the noted rock, *Buachaille* (the herdsman), a conoidal pile of columns, about 30 feet high, lying on a bed of curved horizontal ones, visible only at low water. There is here an extensive surface, resembling that of the Giant's Causeway, and composed of the broken ends of pillars once continuous to the top of the cliff. The colonnade is now for some distance upright and very grand, till the visiter reaches the *Uaimh Binn* (Musical Cave), usually called *Fingal's Cave*, by far the most impressive and interesting object in the island. It opens from the sea with a breadth of 42 feet, a height of 66 feet above the water at mean tide, the pillar on one side being 36 feet high, and that on the other 18. The depth of the recess is 227 feet, and the breadth at the inner termination 22. The sides within are columnar throughout; the columns being broken and grouped in many different ways, so as to catch a variety of direct and reflected tints, mixed with secondary shadows and deep invisible recesses. As the sea never ebbs entirely out, the only floor of this beautiful cave is the fine green water, reflecting from its white bottom tints which vary and harmonise the darker tones of the rock, and often throwing on the columns flickering lights, which its undulations catch from the rays of the sun without.

ANTIQUITIES.

There are in Scotland, and particularly in the district between the Firth of Tay and Moray Firth, numerous mounds, upright slab stones, and carved stones, which are supposed to have been raised as monuments over slain warriors, by the early inhabitants of the country, or by the Danes or other northern nations who occasionally invaded it in remote times. The most remarkable examples of mounds are two at Dunnipace, on the Carron, in Stirlingshire, and one at Fettercairn in Kincardineshire.

A distinct class of mounds, called *moot* or *moat hills*, are common in the south-western and several other districts. They are generally of a square form, with a flat top. It is believed that they served as places for the administration of justice in rude ages.

Of the carved stones, a remarkable example exists at Forres. It contains figures of men and animals, in various compartments. There is another very entire and curious specimen at Aberlemno in Forfarshire. A third at Meigle is remarkable as containing a representation of one of the war-chariots used by the original inhabitants of the country.

In the north of Scotland, and in Orkney, there are some surviving examples of a very remarkable class of early buildings, to which the common people now give the name of *Picts' Houses*, as supposing them to have been built by the Picts. They are generally round buildings, of no great height, with round vaulted tops, altogether built of courses of dressed stone without mortar, and containing for the most part one central chamber, and several long narrow recesses in the thickness of the wall.

Circular mounds, the remains of British and Danish camps, are common on the tops of the Scottish hills, having probably been the places to which the early people retired with their flocks in times of danger. On several hills, particularly in Perthshire and Inverness-shire, there are remains of walls, presenting appearances as if the stony materials had been artificially vitrified. It is not yet clearly ascertained whether these *vitrified forts*, as they are called, were works of our Caledonian ancestors, or the effect of accident, though the former is certainly the more likely supposition.

The weapons used by the aboriginal people are often found, consisting of stone axes, arrow-heads of flint, &c. Necklaces, bracelets, and other ornaments used by them, barbarous in style, but generally of gold, are also often found. In various districts, Druidical circles still exist in a tolerably entire state; but none on so large or regular a scale as those of Stonehenge and Abury.

There are remains of roads and camps formed by the Romans in their hesitating and imperfect attempts to subdue North Britain; and of the wall built under the Emperor Antoninus, between the Firths of Forth and Clyde, with forts at regular intervals, it is still possible to discern a few traces.

The next class of antique objects are the remains of the Gothic fanes, reared on account of religion during the period when the Romish church was triumphant. These are every where very numerous, but in few cases tolerably entire. Excepting two cathedrals, those of Glasgow and Kirkwall (in Orkney), all of that class of

structures are in ruins. The abbeys, priories, and other conventual and collegiate establishments, are in every instance gone to decay. Melrose Abbey, the Cathedral of Elgin, and the Collegiate Church of Roslin, are the most beautiful of these ruinous buildings.

Melrose Abbey.

Numerous specimens of the towers and castles occupied by men of note in the middle ages, still exist, though mostly in a decayed state. Those which indicate the greatest strength and consequence are—*Lochmaben Castle*, the residence of the Bruces, Lords of Annandale; *Hermitage* (Roxburghshire), which belonged to a powerful noble named Lord Soulis; *Douglas*, the residence of the Earls of Douglas; *Turnberry* (Ayrshire), the residence of the Earls of Carrick; *Bothwell*, another stronghold of the Douglases; *Tantallon* (Haddingtonshire), the residence of the Earls of Angus, a branch of the Douglas family; *Dunnottar* (Kincardineshire), the seat of the Earls Mareschal; and *Doune* (Perthshire), the stronghold of Robert Earl of Fife, brother of Robert III., and governor of Scotland. Four places of strength, *Edinburgh*, *Stirling*, *Dunbarton*, and *Blackness Castles*, are still kept in repair at the public expense, and serve as barracks for foot soldiers.

MANSIONS.

The mansions of the nobility and gentry of Scotland do not differ in any important respect from similar classes of structures in England. The "hall" is, however, completely wanting in Scotland, and there are comparatively few specimens of the Elizabethan style. Turbulent times being more recent in Scottish than in English history, the chief mansions of an unfortified character in the northern kingdom are not of earlier date than the reign of Charles II., and most of them are much later. In many instances, the whole or part of the original castellated buildings which stood on the same site are retained.

Before the reign of James III. (1460–1488), there seems to have been no mansion besides the regular tower, with its surrounding inferior buildings, and external wall or barmkyne. In that, and one or two of the ensuing reigns, a few mansions were built, in an ornamental style, having, for instance, an elegant front looking inwards to a quadrangular court; yet, in these instances, the outside of the building was still a plain and almost dead wall, calculated for defence. *Crichton Castle* (Edinburghshire) and *Linlithgow Palace*, are examples. In the reign of James VI., the favourite style was the tall square tower; but this was now rendered somewhat more ornamental by means of sundry flourishes, such as minor towers projecting like pepper-boxes from the corners. *Glammis Castle* (Forfarshire) is a superb specimen of this class of mansions.

In the reign of Charles II., mansions were for the first time built in any thing like pure Grecian taste. This was introduced by Sir William Bruce of Kinross, Bart., an architect of considerable skill, and of whose works the modern Holyrood Palace, and his own house ross, are examples. During the last century, the mansions built in Scotland have partaken of all changes of taste passing through England, from heavy barrack-like structures of Sir John V to the light and elegant sian style of Adam. have now chateau- in style of the middle (*Gordon Castle*, Banffshire, and *Culzean* in Ayr Grecian structures by Adam (*Hopetoun House*, lithgowshire); mansions in the Doric and more Grecian style since introduced (*Hamilton Palace*, a perb example); and, very lately, a few specimens in priory and Elizabethan styles.

CHIEF TOWNS.

Edinburgh, the capital, is situated in the county of same name, on a cluster of eminences, distant betw one and a half and three miles from the Firth of Fo The city is composed of two principal parts, the and New Towns, the former being built on a long ridg eminence gently rising towards the west, where it minates in a lofty and abrupt rock, on which the Ca is situated, while the latter occupies lower ground wards the north. The town is universally built of a sandstone, which retains its original colour in the new parts of the town and in the best public buildings, a forms one of the most important features of Edinburg

Edinburgh.

The New Town is laid out on a regular plan of rectangular streets and squares, exhibiting in general much architectural elegance. Between the Old and New Towns, and between various sections of the New Town itself, as well as in the centres of the principal squares there are gardens laid out in the modern landscape style, forming delightful places of recreation. It is chiefly owing to the unequal ground on which Edinburgh is situated, the massive elegance and regularity of its buildings, the intermixture of ornamental pleasure-ground, and the picturesque hills immediately adjacent, whence distant and extensive prospects are commanded, that this city makes so great an impression on most strangers.

Formerly the seat of the government of the country, Edinburgh is still that of the supreme law-courts and of a flourishing university. It is also to a great extent a city of residence, not only for affluent persons connected with the country, but for strangers desirous of enjoying a society of moderate habits, and the benefit of education for their children. Its leading classes are thus composed of legal practitioners, learned persons and families in independent circumstances. It is also in a small degree a manufacturing town, the principal trades being the brewing of ale (for which the town is celebrated), coachmaking, the weaving of shawls, and the printing and issuing of literary productions. The leading periodical publications are the well-known Edinburgh Review, Blackwood's and Tait's Magazine, and a Philosophical and Medical Journal, besides which there are a number of smaller size. The town is distinguished for its numerous banking institutions, which exert an influence on the general trade of the country. Within a few miles of the city, on the Esk River, there are various paper-mills, at which vast quantities

ld Stewart, and Professor Playfair, an astronomical servatory, and a small portion of a building designed a national monument to the Scotsmen who perished the last war, but which will probably never be com-ted. The population of Edinburgh in 1831 was 6,391.

Leith, the sea-port of Edinburgh, and recently con-tuted an independent parliamentary burgh, is situated the efflux of the rivulet of the same name, which iginally constituted its harbour. The older part of the wn is crowded and mean, but in the outskirts there e some good streets. The town is connected with dinburgh by a broad and beautiful road, above a mile length, denominated Leith Walk. Besides the quays rting the embouchure of the river, there is a range wet-docks; but the harbour, after vast efforts to prove it, continues to labour under several strong tural disqualifications. During spring tides, the at-ast depth of water on the bar at the mouth of the ver is seventeen feet—during neap tides, fourteen et; and it is rarely that a vessel of 400 tons can gain mission. The want of deep water at Leith is partly pplied by a harbour at Newhaven, a stone-pier at ranton, and a chain-pier at Trinity, which serve as aces of embarkation and debarkation for steamers d other vessels devoted chiefly to passengers. The ief foreign trade of Leith is with the ports in the ltic and north of Europe; next to this in importance nks its intercourse with the West Indies. But the ports of Leith are chiefly for local consumption, and ar little reference to the great manufacturing busi-es of the country. For the coasting trade there are rious companies, each of which has several vessels in ployment. Amongst the ports with which regular tercourse is carried on by steam, may be mentioned ondon, Hull, Newcastle, Aberdeen, and Rotterdam. he tonnage belonging to Leith is on the decline: it as, in 1826, 25,674; in 1832, 23,054; in 1835, 22,073. he amount of tonnage which entered the harbour in 35 was 340,540. The gross amount of customhouse ties in 1834 was £386,905. In Leith there are seve-l breweries, a sugar-refining establishment, and seve-l manufactories of soap, candles, ropes, and glass. he Customhouse, an elegant modern building, is the at of the Board of Customs for Scotland. In 1831 e population of Leith was 25,955. The town, in union ith Newhaven, Portobello, and Musselburgh, returns member to Parliament.

Glasgow, the most populous city in Scotland, occupies highly advantageous situation on the banks of the lyde, in Lanarkshire, a few miles from the place where e river expands into an estuary, 42 miles from Edin-rgh, 397 from London, and 196 from Dublin. The xternal appearance of this great city is elegant and mpressive. The streets are regular in arrangement, nd substantially built of smooth stone. The public uildings are in general handsome, and, in most in-ances, disposed in such a manner as to be seen to dvantage. The more ancient part of the city extends ong the line of the High Street, between the Cathe-ral and the river; the more modern and elegant part retches towards the north-west. On the left bank of e river, and connected by three bridges, is situated e populous barony of Gorbals, bearing the same re-rence to Glasgow which Southwark bears to London. Vestward from the lowest of the bridges, both sides of e river are formed into quays, which, owing to recent perations for deepening the channel, are now ap-roached by vessels drawing about fourteen or fifteen et water. The quay on the right or north bank is enominated the *Broomielaw*; it has recently been ex-nded to 3340 feet in length, while that on the south ank is 1260 feet.

Glasgow took its rise as a dependency of the cathe-ral of the bishops (latterly archbishops) of the see earing its name. It was not, however, till long after e Reformation, that it became a seat of considerable opulation. About the middle of the eighteenth cen-ury, it had acquired a considerable share of the import

colonial trade, which it still retains; but, during the last seventy years, it has chiefly been distinguished as a seat of manufactures. The weaving of lawns, cambrics, and similar articles, commenced in Glasgow in 1725. The advantages enjoyed by the city for the importation of cotton, in time gave a great impulse to that species of manufacture. In 1834, out of 134 cotton-factories existing in Scotland, 100 belonged to Glasgow, and the importation of cotton into that port amounted to 95,703 bales. In the weaving of this material, upwards of 15,000 power-looms, and 32,000 hand-loom weavers, were at the same time employed by the manufacturers of Glasgow. Of calico-printing establishments there are upwards of forty. It would be vain to attempt an exact enumeration of the less prominent features of the business carried on in Glasgow. The chief articles of importation, besides cotton, are sugar, rum, tea, tobacco, and timber. The chief articles manufactured or prepared, besides cotton goods, are sugar, soap, glass, iron, ropes, leather, chemical stuffs, and machinery. There were recently seven native banks, and several branches of other banks. During a year extending from a certain period in 1839, to a certain period in 1840, 5484 vessels, of 296,302 tonnage, arrived at the Glasgow harbour; the customhouse revenue of 1839 was £468,975, and the harbour dues of the twelvemonth ending August 31 of that year were £45,826. It is worthy of remark, that the Clyde was the first river in the elder hemisphere on which steam navigation was exemplified. A steam-vessel of three horse power was set afloat on the river in January 1812, by Mr Henry Bell of Helensburgh; and there were twenty such vessels on the Clyde before one had disturbed the waters of the Thames. In 1835 there were sixty-seven steam-vessels, of 6691 aggregate tonnage, connected with Glasgow, eighteen of which plied to Liverpool, Belfast, Dublin, and Londonderry. Within the last few years, the city has become a great centre of the iron trade, this metal being produced in the neighbourhood to an annual amount of not less than 200,000 tons. As a necessary consequence of the commerce and manufactures which flourish in Glasgow, the city has a vast retail trade in all the articles of luxury and necessity which are used by human beings. But no circumstance connected with Glasgow could give so impressive an idea of the height to which business has been carried in it, as the rapid advance and present great amount of its population. By the census of 1791, the inhabitants were 66,578; and by the first government census in 1801, they were 77,385. But these numbers have been increased in 1811, 1821, and 1831, respectively to 110,749, 147,043, and 202,426. As the increase is about 7000 per annum, the present amount (1841) is supposed to be fully 235,000—a mass of population which, at the time of the Union, could not have been dreamt of as likely ever to exist in any Scottish city.

The Cathedral, or High Church, is situated in the northern outskirts of the city, near the upper extremity of the High Street. The bulk of the existing building was constructed at the close of the twelfth century, in place of another which had been consecrated in 1136, but was destroyed by fire. It consists of a long nave and choir, a chapter-house projecting from the north-east angle, a tower and spire in the centre, and a crypt extending beneath the choir or eastern portion of the building. In the nave, termed the Outer High Kirk, was held the celebrated General Assembly of the Church, November 1638, by which Episcopacy was abolished and pure Presbytery replaced—the first great movement in the civil war.

The elevated ground, near the east end of the Cathedral, has been formed into an ornamental place of sepulture, under the appellation of the Necropolis. Since 1831, the Society of Merchants, its proprietors, have expended the sum of £6000 in laying out about twenty-four acres of ground in walks and shrubberies, and in connecting the spot with the opposite slope by *means of a bridge* across the intermediate rivulet. The taste manifested in the whole scheme a execution, is extremely creditable to the ci walks, several miles in extent, command an view of the neighbouring country. They ar by numberless sepulchral plots and excavatio already affection has been busy in erecting i memorials," all of which, it may be mentio fashioned according to certain regulations, wi to general keeping and effect.

The College buildings are situated on the of the High Street, about half-way between tl dral and the Trongate. They consist in double court; the front which adjoins to t being 330 feet in length, and three storeys i The whole edifice has a dignified and venei pearance. A large piece of ground behind lege is formed into a park or green, interspe trees and hedges, and always kept in grass, t by the students as a place of exercise or am In the College there are appointed profe teachers of about thirty branches of scien logy, and polite literature. At the back of rior court stands the modern Grecian buildi contains the Hunterian Museum. This is a l lection of singular natural objects, coins, me manuscripts, paintings, and relics of antiqui nally formed by Dr William Hunter, the c anatomist, and bequeathed by him to this u at which he received his education. While th confers professional education, popular instruc tainable, under unusually advantageous circu through the medium of the Andersonian In an extensive school of science founded at the the last century, and connected with which t general museum, containing many curious obj constantly open to the public.

The most attractive modern building in G the Royal Exchange in Queen Street, a mos structure, erected in 1829, as a point of assem the merchants in the western part of the ci principal room is a large hall, supported by row of columns, and used as a reading-roo front of the Exchange consists of a magnific tico, surmounted by a cupola; and, as the is isolated, the other sides are also of decorati tecture. Altogether, this building, supported of very elegant domestic structures of similar proportions, impresses the mind of a stranger thing signally worthy of a great city.

Since the Reform Act of 1832, Glasgow ha vilege of returning two members to Parliame places of worship, charitable institutions, a clations of various kinds for public objects, numerous. A laudable zeal for the improv education marks the city; and a normal school nary for the rearing of teachers—the first in t —has been erected under the auspices of a society.

The means of communication in connex Glasgow, are suitable to the character of th one of the greatest emporia of commerce and ture in the world. Besides a river, navigabl sels drawing fifteen feet of water, and which means of a ready communication with the shores of Britain, with Ireland, and with Ant Forth and Clyde Canal, of which a branch Port-Dundas, in the northern suburbs, serve vey goods and passengers to the eastern shor island, while canals of less note connect the Paisley and Johnstone in one direction, and great coal-fields of Monkland in the other. Th a railway, which traverses the same great by Garnkirk and Wishaw, and conveys passe well as coal and goods. Another railway, c the city with Kilmarnock, Ayr, and the port of san, was opened in 1840. During the year in w sheet makes its appearance, a third railway by Falkirk and Linlithgow to Edinburgh, will b Others are projected. The steam communica

, moreover, by virtue of the recent Reform Acts, rliamentary burgh of the first class, returning one ber of Parliament. The principal branches of rade conducted in Greenock have reference to the and West Indies, the United States, and British erica, to which last it yearly sends out great numbers migrants. Sugar-baking and ship-building are other nches of industry carried on here to a great extent. Customhouse, fronting to the Firth of Clyde, is a utiful Grecian building, erected in 1818, at an ex- se of £50,000. The Tontine Hotel, situated in one the principal streets, and containing a large public m, twelve sitting-rooms, and thirty bed-rooms, was t, in 1801, by 400 subscribers at L.25 each; the le expense being thus £10,000. There is also an ant building, in the character of an exchange, ch cost £7000, and contains, besides two spacious mbly rooms, a reading-room, to which strangers admitted gratuitously for six weeks. In Greenock re are two native banks, besides branches of several ers.

James Watt, the improver of the steam-engine, was n in Greenock in 1736; and an Institution for lite- y and scientific purposes, designed to serve as a nument to him, and termed the Watt Institution, been recently completed. The situation of the n, on the shore of a land-locked basin of the Firth Clyde, with the mountains of Argyllshire and Dun- tonshire rising on the opposite side, is very fine.

Amongst Scottish towns, *Aberdeen* ranks next to inburgh and Glasgow. It is situated in the county med from it, on a level piece of ground between the uths of the rivers Dee and Don, 110 miles from inburgh. Its external appearance produces a favour- e impression; the principal streets are straight and ular, and the buildings at once substantial and elo- nt, the chief material used in constructing them being roy granite found here in great abundance. New erdeen, or what is now generally called Aberdeen, close to the efflux of the Dee, the mouth of which ms its harbour; and Old Aberdeen, where the an- nt Cathedral and King's College are situated, is a nparatively small town, about a mile distant, on the k of the Don. The entire population is about 60,000. Aberdeen is a city of great antiquity. It became the t of an university by the erection of King's College Old Aberdeen, in 1495; Marischal College, in New erdeen, was added in 1593. By the recent reform s, it is a royal burgh of the first class, divided into tricts for municipal purposes, and returning one mber to Parliament. Aberdeen is at once a seat manufactures and a sea-port. There are four great uses engaged in the cotton manufacture, two in the ollen trade, and three in flax-spinning and the weav- of linen. Ship-building, iron-founding, comb-making, pe-making, and paper-making, are also carried on to great extent. The fisheries of the River Dee, and export of granite, are sources of considerable in- me. Of the exports for the year 1836, we may notice, indicating at once the extent and nature of the ricultural and manufacturing products of the dis- ct, the following items:—Flax manufactures, 30,482 rrel bulk; cotton manufactures, 16,336 do.; woollen nufactures, 20,043 do.; oats, 69,239 quarters; meal, ,375 bolls; sheep and lambs, 1407; pigs, 3034; but- , 9261 cwts.; eggs, 8120 barrel bulk; pork, 6006 ts.; salmon, 7757 do.; granite stones, 1736 tons. The ief imports are, coal, of which there was unloaded, ring the same year, 371,914 bolls; lime, cotton, flax, ol, wood, wheat, flour, salt, iron, whale-blubber, and scellaneous goods, consisting of groceries, &c. There re, in 1836, belonging to the port of Aberdeen, 360 ssels, tonnage 42,030, employing 3110 men.

Aberdeen is entered from the south by Union Street, elegant double line of buildings, a mile in length and enty feet wide, in the centre of which a ravine per- ded by a rivulet is crossed by a noble arch of one ndred and thirty-two feet in span, upon a rise of enty-two. King Street, which opens up the city from

colonial trade, which it still retains; but, during the last seventy years, it has chiefly been distinguished as a seat of manufactures. The weaving of lawns, cambrics, and similar articles, commenced in Glasgow in 1725. The advantages enjoyed by the city for the importation of cotton, in time gave a great impulse to that species of manufacture. In 1834, out of 134 cotton-factories existing in Scotland, 100 belonged to Glasgow, and the importation of cotton into that port amounted to 95,703 bales. A canal leaves the a suburbs of Glasgow, and, passing Paisley, ter- at Johnstone. Paisley is also benefited by the and Ayr Railway, which passes it.

enfrewshire, also, is situated *Greenock*, the sea-port of the kingdom as far as customhouse form a criterion, these having been, in 1834, 8 in gross amount. This town occupies a strip g ground facing towards the Firth of Clyde, at ance of twenty-four miles from Glasgow. In enteenth century it was a mere hamlet; now handsome town of about 30,000 inhabitants, ng harbours and quays of 2200 feet in extent, h belonged, in 1828, 219 vessels of 31,929 ns tonnage, and employing 2210 men. It is now, moreover, by virtue of the recent Reform Acts, a parliamentary burgh of the first class, returning one member of Parliament. The principal branches of commerce conducted in Greenock have reference to the East and West Indies, the United States, and British America, to which last it yearly sends out great numbers of emigrants. Sugar-baking and ship-building are other branches of industry carried on here to a great extent. The Customhouse, fronting to the Firth of Clyde, is a beautiful Grecian building, erected in 1818, at an expense of £30,000. The Tontine Hotel, situated in one of the principal streets, and containing a large public room, twelve sitting-rooms, and thirty bed-rooms, was built, in 1801, by 400 subscribers of L.25 each; the whole expense being thus £10,000. There is also an elegant building, in the character of an exchange, which cost £7000, and contains, besides two spacious assembly rooms, a reading-room, to which strangers are admitted gratuitously for six weeks. In Greenock there are two native banks, besides branches of several others.

James Watt, the improver of the steam-engine, was born in Greenock in 1736; and an institution for literary and scientific purposes, designed to serve as a monument to him, and termed the Watt Institution, has been recently completed. The situation of the town, on the shore of a land-locked basin of the Firth of Clyde, with the mountains of Argyllshire and Dunbartonshire rising on the opposite side, is very fine.

Amongst Scottish towns, *Aberdeen* ranks next to Edinburgh and Glasgow. It is situated in the county named from it, on a level piece of ground between the efluxes of the rivers Dee and Don, 110 miles from Edinburgh. Its external appearance produces a favourable impression; the principal streets are straight and regular, and the buildings at once substantial and elegant, the chief material used in constructing them being a grey granite found here in great abundance. New Aberdeen, or what is now generally called Aberdeen, is close to the efflux of the Dee, the mouth of which forms its harbour; and Old Aberdeen, where the ancient Cathedral and King's College are situated, is a comparatively small town, about a mile distant, on the bank of the Don. The entire population is about 60,000.

Aberdeen is a city of great antiquity. It became the seat of an university by the erection of King's College in Old Aberdeen, in 1495; Marischal College, in New Aberdeen, was added in 1593. By the recent reform acts, it is a royal burgh of the first class, divided into districts for municipal purposes, and returning one member to Parliament. Aberdeen is at once a seat of manufactures and a sea-port. There are four great houses engaged in the cotton manufacture, two in the woollen trade, and three in flax-spinning and the weaving of linen. Ship-building, iron-founding, comb-making, rope-making, and paper-making, are also carried on to a great extent. The fisheries of the River Dee, and the export of granite, are sources of considerable income. Of the exports for the year 1836, we may notice, as indicating at once the extent and nature of the agricultural and manufacturing products of the district, the following items:—Flax manufactures, 30,482 barrel bulk; cotton manufactures, 16,336 do.; woollen manufactures, 20,043 do.; oats, 69,239 quarters; meal, 13,375 bolls; sheep and lambs, 1407; pigs, 3034; butter, 9261 cwts.; eggs, 8120 barrel bulk; pork, 6006 cwts.; salmon, 7757 do.; granite stones, 1738 tons. The chief imports are, coal, of which there was unloaded, during the same year, 371,914 bolls; lime, cotton, flax, wool, wood, wheat, flour, salt, iron, whale-blubber, and miscellaneous goods, consisting of groceries, &c. There were, in 1836, belonging to the port of Aberdeen, 360 vessels, tonnage 42,080, employing 3110 men.

Aberdeen is entered from the south by Union Street, an elegant double line of buildings, a mile in length and seventy feet wide, in the centre of which a ravine pervaded by a rivulet is crossed by a noble arch of one hundred and thirty-two feet in span, upon a rise of twenty-two. King Street, which opens up the city from

in its course through Longford, Roscommon, and the King's County. All these bogs might be easily reclaimed, could they be drained; but that cannot be accomplished, as the Inny and the Shannon are kept up to their present level by the numerous eel-weirs which at present interrupt their course. There are also [illegible] bog in the western counties, and many [illegible] both in Ulster and Munster; but none of [illegible] as those above mentioned. It is remarkable, [illegible] withstanding the quantity of water contained in these extensive bogs, there arises from them no miasma injurious to health. This is attributable to the large portion of tannin they contain, which possesses so strong an antiseptic quality, that bodies plunged into a deep bog remain undecayed, the flesh becoming like that of an Egyptian mummy. It sometimes happens that a bog, overcharged with water during a rainy season, breaks through the obstruction which the drained and more solid part affords, and, rushing forward, overflows large portions of good land. This occurred in the year 1821, when the Bog of Clara, in the county of Westmeath, suddenly burst into the valley of the River Brusna, and totally destroyed many hundred acres of excellent land: a similar occurrence took place, to a large extent, a very few years since, in the county of Antrim.

Ireland is described as a thickly wooded country, not only by her early native writers, but by all those English authors who have given any account of the country, from the days of Giraldus Cambrensis, about A. D. 1185. Morrison (1596) and Davis (1605), mention the forests in which the poor Irish took refuge; and all the scenery of Spenser's *Fairy Queen* is drawn from the River Bandon, which he celebrates as the "pleasant Bandon, wood y-crowned," as it is to this day. Boate, in his Natural History, mentions the great extent of wood then standing; but not long did it so stand, for wherever Cromwell's army came, the forests were felled, and the country laid bare. In most cases, the bogs give ample testimony to the truth of these statements, some supplying large quantities of fir, which burns with a pleasant aromatic smell, and a flame so brilliant that it is often used in place of candles. In other bogs, only oak is dug up, and sometimes sallow, and yew of a great size, which takes a fine polish and is used for cabinet-work. There are still, in a few favoured spots, some remains of the ancient oak and ash woods, as at Killarney, at Glengariffe near Bantry, in Connemara, in some spots of the county of Wicklow, and in Donegal, near the beautiful but little Lough Van, where a few red deer are still to be seen. Near the mouth of the Suir, at the foot of the Knockmeledan Mountains, is a wood of the pine species, commonly called Scotch fir, of such size and hardness, that Mr Nimmo the engineer pronounced it to be equal to the best Memel timber, and used it in constructing the pier at Dunmore. Many noblemen and gentlemen have planted largely and with great success, their flourishing plantations giving promise that the country in a few years will again be furnished with trees.

Ireland possesses many large and remarkably fine rivers, several of which form lakes at certain points in their course, and fall into the sea at the head of spacious bays every way suitable for navigation. The principal rivers are the *Foyle* and the *Bann*, which flow into the Northern Ocean; the *Boyne*, the *Liffey*, and the *Slaney*, which empty themselves into the Irish Channel; the *Barrow* and the *Nore*, which, falling into the *Suir*, pour their united streams into the Bay of Waterford; the *Blackwater* and the *Lee*, which run southward, their embouchures being at Youghal and Cork; the *Shannon*, the *Gweebarra*, the *Erne*, the *Moy*, the *Main*, and the *Laune*, which flow into the Atlantic. Among inland lakes or loughs, the largest is *Lough Neagh* in Ulster, which exceeds in size any lake in the United Kingdom, its length being twenty miles by a breadth of from ten to twelve: its waters are discharged by the Bann.

[illegible] IT RE.—MINERALOGY.

[illegible] lies w[illegible]rd into the Atlantic, is [illegible] has b[illegible]ated, by deep bays, t[illegible] [illegible] ies, which have hith[illegible] [illegible] boisterous ocean to w[illegible] are exposed. The rock which forms the [illegible] bottom of these bays, is generally composed of secon lary or carboniferous limestone, while the jecting promontories to the north and south of are composed, for the most part, of primary or t sition rocks, and particularly of granite, mica-s quartz rock, grawacke, and old red sandstone glomerate.—In Ireland, the coast is mostly moun ous, and the interior flat. Thus, we find the moun of A trim on the east; of Derry and Donegal on no -west coasts; those of Sligo and Kerry west so -west. The slate districts of Cork and Wate the south and south-east, while the mountai low, and those still higher ones of Louth are situated on the eastern coast. The int island is, generally speaking, composed of tly swelling grounds, covered with rich and f soil. This peculiar conformation of the su has been the origin of the great number of rivers which the Irish coast abounds. They have their so in the neighbouring mountains, whence they directly to the sea. The flatness of the interior of land has been the probable cause of those vast a mulations of alluvial matter called *escars*. They sibly originated at a period when the country w least partially submerged, from eddies formed by dulations on the surface. The origin of the great t of bog found so generally in the flat country, ma attributed to the water pent up, as we even now it, above the level of the dry country, by gravel which form a continuous ridge, though not of e height, round the edge of the bog. The central dis of Ireland contains upwards of one million of acr bog, comprehended between Wicklow Head and way, Houth Head and Sligo.

A vast tract of limestone extends in an almost broken line from the north of Cork to the sou Fermanagh, with an intermixture towards the eas coast of clayslate, grawacke, and grawacke-slate, veins of granite interspersed, as is the case in the e ties of Down, Armagh, and Wicklow. The sout coast is composed of limestone and old conglome with red, purple, and grey clayslate, which may be tinctly seen along the shores of Cork and Water In the south-western coasts are large tracts of formation; while the western are formed of gra carboniferous limestone, including the lower limest calp or black shale series, and the upper limest with a tract of the coal formation. There are al Galway, Mayo, and Sligo, tracts of mica-slate, qu rock, yellow sandstone, and conglomerate. The n ern division, consisting of the counties of Donegal Derry, is chiefly mica-slate, with an intermixtur the northern part of Donegal, of granite, quartz r and primary limestone; while the county of Antri composed of tabular trap. The counties in which is worked are Carlow, Kilkenny, Donegal, Lime Tyrone, and part of Tipperary. Ireland is ric minerals, and contains gold, silver, though not in l veins, as well as copper, lead, coal, and sulphur. quarries also produce a variety of beautiful marble the black marble of Kilkenny, the green of Gal and the many-coloured of Fermanagh. The qua of Killaloe and of Valentia, in the county of K afford large-sized excellent slates, now coming e sively into use. Nor should the inexhaustible su of extremely fine building-stone which the hills a of Dublin afford, be left [illegible] ientioned. Of this gra the particular vein which [illegible] worked at the coast vi of Bullock, has been found to withstand the wash o sea better than any other kind of stone, and is e sively reserved for the building of the lower stor those lighthouses which are exposed to violent sea

NUMBER 16. NEW AND IMPROVED SERIES. PRICE 1½d.

DESCRIPTION OF IRELAND.

large and important section of the United King- is geographically described as an island situated west of Great Britain, from which it is divided strait, called at different places St George's Chan- the Irish Sea, and North Channel, the Atlantic ing the boundary on the other sides. Of a more pact form than Great Britain, it is nevertheless rated by a considerable number of deep bays and ions, which give it an outline upon the whole irre- r. Besides enjoying this advantage for internal gation, it may be considered as more favourably ted for foreign commerce than either England or land. It lies between 51° 19′ and 55° 23′ north ude, and 5° 19′ and 10° 28′ of west longitude from nwich; but the greatest length, from Brow Head e county of Cork, to Fair Head in the county of ım, is 306 miles, and the longest transverse line, ose similar points in the counties of Mayo and h, 182 miles. The entire area appears, from the t and best measurement, to include 31,874 square s, or 20,379,608 acres.

land is divided into four provinces, namely, LEIN- , on the east; MUNSTER, on the south; ULSTER, e north; and CONNAUGHT, on the west: these are ivided into 32 counties, 252 baronies, and 2348 hes. For an account of the ecclesiastical divisions civil polity, we refer to the CONSTITUTION AND URCHES OF THE BRITISH EMPIRE.

In superficial character, Ireland may be called a hilly or mountainous country, since there are few spots where the view is not terminated by lofty hills or mountain scenery. Generally speaking, the mountains stand in groups, and are more or less detached from each other; but in some districts they form ridges of great extent. The *Mourne* range, in the county of Down, lies west and east, ending with *Slieve Donard*, which rises 2809 feet above the level of the sea, and is the highest of the northern mountains. The *Slieve Bloom* mountains, placed in nearly the centre of the island, run north and south, intersecting the King and Queen's Counties: in this range, sometimes called the *Ard na Erin*, or Heights of Ireland, the rivers Nore, Barrow, and Suir, commonly called by the country people the Three Sisters, take their rise. In Connaught there is a fine range, of which the *Twelve Pins* form a part; and in Munster, a ridge of varied height extends from Dungarvon, in the county of Waterford, across the kingdom, into the county of Kerry. It may be here observed, that wherever the Irish term *slieve* is applied to a mountain, it expresses that that mountain forms part of a range. The highest mountain in Ireland is *Carran Tual*, at Killarney, being 3410 feet above the level of the sea. *Mount Nephin* and *Croagh Patrick*, two conspicuous mountains in Mayo, are respectively 2639 and 2499 feet high. Some, however, of the counties, though possessing a very varied surface, can only boast of hills, as Armagh, Monaghan, Cavan, and Louth, while others are in general very level: Meath, Kildare, Longford, and Galway, are of the latter character. A distinguishing peculiarity of the country, whether in its hilly or more level districts, is its generally green appearance, a circumstance arising from its fertile soil and moist and temperate climate, and which has led to its receiving the appellations of the "Emerald Isle" and "Green Isle of the Ocean"—names sung by its poets, and repeated with affection by its natives in all quarters of the world.

In the lower and less reclaimed portions of the country, there are various extensive bogs or morasses, which disfigure the beauty of the scenery, and are only serviceable in supplying fuel to the adjacent inhabitants. The chief of these morasses is the Bog of Allen, which stretches in a vast plain, across the centre of the island, or over a large portion of Kildare, Carlow, and the King and Queen's Counties. In this bog, the beautiful River Boyne takes its rise, flowing thence north-eastward to the sea at Drogheda, on the borders of the county of Louth: much of this bog has been drained and brought into tillage, and there is good reason to think that in time the whole of it will be reclaimed. Along the banks of the River Inny, which, rising in Lough Iron, in the county of Westmeath, crosses Longford and falls into the Shannon, are large tracts of deep wet bog, only exceeded in dreariness by that which for miles skirts the Shannon,

in its course through Longford, Roscommon, and the King's County. All these bogs might be easily reclaimed, could they be drained; but that cannot be accomplished, as the Inny and the Shannon are kept up to their present level by the numerous eel-weirs which at present interrupt their course. There are also many tracts of bog in the western counties, and many detached bogs both in Ulster and Munster; but none of such great size as those above mentioned. It is remarkable, that notwithstanding the quantity of water contained in these extensive bogs, there arises from them no miasma injurious to health. This is attributable to the large portion of tannin they contain, which possesses so strong an antiseptic quality, that bodies plunged into a deep bog remain undecayed, the flesh becoming like that of an Egyptian mummy. It sometimes happens that a bog, overcharged with water during a rainy season, breaks through the obstruction which the drained and more solid part affords, and, rushing forward, overflows large portions of good land. This occurred in the year 1821, when the Bog of Clara, in the county of Westmeath, suddenly burst into the valley of the River Brusna, and totally destroyed many hundred acres of excellent land: a similar occurrence took place, to a large extent, a very few years since, in the county of Antrim.

Ireland is described as a thickly wooded country, not only by her early native writers, but by all those English authors who have given any account of the country, from the days of Giraldus Cambrensis, about A. D. 1185. Morrison (1596) and Davis (1605), mention the forests in which the poor Irish took refuge; and all the scenery of Spenser's *Fairy Queen* is drawn from the River Bandon, which he celebrates as the "pleasant Bandon, wood y-crowned," as it is to this day. Boate, in his Natural History, mentions the great extent of wood then standing; but not long did it so stand, for wherever Cromwell's army came, the forests were felled, and the country laid bare. In most cases, the bogs give ample testimony to the truth of these statements, some supplying large quantities of fir, which burns with a pleasant aromatic smell, and a flame so brilliant that it is often used in place of candles. In other bogs, only oak is dug up, and sometimes sallow, and yew of a great size, which takes a fine polish and is used for cabinet-work. There are still, in a few favoured spots, some remains of the ancient oak and ash woods, as at Killarney, at Glengariffe near Bantry, in Connemara, in some spots of the county of Wicklow, and in Donegal, near the beautiful but little Lough Van, where a few red deer are still to be seen. Near the mouth of the Suir, at the foot of the Knockmeledan Mountains, is a wood of the pine species, commonly called Scotch fir, of such size and hardness, that Mr Nimmo the engineer pronounced it to be equal to the best Memel timber, and used it in constructing the pier at Dunmore. Many noblemen and gentlemen have planted largely and with great success, their flourishing plantations giving promise that the country in a few years will again be furnished with trees.

Ireland possesses many large and remarkably fine rivers, several of which form lakes at certain points in their course, and fall into the sea at the head of spacious bays every way suitable for navigation. Among the lakes or loughs, the largest is *Lough Neagh* in Ulster, which exceeds in size any lake in the United Kingdom, its length being twenty miles by a breadth of from ten to twelve: its waters are discharged by the

GEOLOGICAL STRUCTURE.—MINERALOGY.

Ireland stretches westward into the Atla
is indented, as has been stated, by deep b
tected by jutting promontories, which have
withstood the force of the boisterous ocean
they are exposed. The rock which forms
or bottom of these bays, is generally compos
secondary or carboniferous limestone, while
jecting promontories to the north and soutl
are composed, for the most part, of primary
sition rocks, and particularly of granite, m
quartz rock, grawacke, and old red sandst
glomerate. In Ireland, the coast is mostly s
ous, and the interior flat. Thus, we find the n
of Antrim on the east; of Derry and Donegi
north-west coasts; those of Sligo and Kerry
south-west. The slate districts of Cork and W
form the south and south-east, while the mou
Wicklow, and those still higher ones of L
Down, are situated on the eastern coast. Th
of the island is, generally speaking, compose
or gently swelling grounds, covered with rich
ful soil. This peculiar conformation of th
has been the origin of the great number of ri
which the Irish coast abounds. They have thei
in the neighbouring mountains, whence t
directly to the sea. The flatness of the interi
land has been the probable cause of those v
mulations of alluvial matter called *escars*.
sibly originated at a period when the counti
least partially submerged, from eddies forme
dulations on the surface. The origin of the gr
of bog found so generally in the flat country
attributed to the water pent up, as we even
it, above the level of the dry country, by gra
which form a continuous ridge, though not
height, round the edge of the bog. The centr
of Ireland contains upwards of one million o
bog, comprehended between Wicklow Head
way, Houth Head and Sligo.

A vast tract of limestone extends in an al
broken line from the north of Cork to the
Fermanagh, with an intermixture towards th
coast of clayslate, grawacke, and grawacke-s
veins of granite interspersed, as is the case in
ties of Down, Armagh, and Wicklow. The
coast is composed of limestone and old cong
with red, purple, and grey clayslate, which m
tinctly seen along the shores of Cork and W
In the south-western coasts are large tract
formation; while the western are formed o
carboniferous limestone, including the lower l
calp or black shale series, and the upper l
with a tract of the coal formation. There a
Galway, Mayo, and Sligo, tracts of mica-slat
rock, yellow sandstone, and conglomerate. T
ern division, consisting of the counties of Do
Derry, is chiefly mica-slate, with an interm
the northern part of Donegal, of granite, qu
and primary limestone; while the county of
composed of tabular trap. The counties in w
is worked are Carlow, Kilkenny, Donegal,
Tyrone, and part of Tipperary. Ireland i
minerals, and contains gold, silver, though no
veins, as well as copper, lead, coal, and sulph
quarries also produce a variety of beautiful m
the black marble of Kilkenny, the green o
and the many-coloured of Fermanagh. The
of Killaloe and of Valentia, in the county
afford large-sized excellent slates, now comm
sively into use. Nor should the inexhaustib
of extremely fine building-stone which the h
of Dublin afford, be left unmentioned. Of thi
the particular vein which is worked at the co
of Bullock, has been found to withstand the w
sea better than any other kind of stone, and
sively reserved for the building of the lower
those lighthouses which are exposed to violent

e kingdom, standing sometimes singly, but most com-
only in conjunction with one or more of the above-
entioned relics of pagan times. Tradition says, that
rmerly the people collected round such stones for
orship, which is confirmed by the common expression
Irish of "going to the stone," for going to church or
apel. These stones are conceived by many to have
ven rise to the carved stone cross found in various
urchyards, and of which one of the finest specimens
to be seen at Monasterboyce, in the county of Louth.
There are several kinds of tumuli remaining, of which
e Irish names declare the original object. The *Lios*
r *Lis*, which signifies a fortified house, was an artificial
ill, sometimes approaching in shape to an ellipse, with
flat top, and an earthen breastwork or rampart thrown
ound the little plain on the summit, where was placed
e dwelling, usually protected by a strong wattled
ailing, as is now customary among the Circassians.
he *Duns* or *Doons* were places of strength, always
rched on a rocky bold situation, and fenced by a
round wall of extremely large stones, which wall forms
ne of the distinctions between the dun and the lis.
he *Rath* signifies a village or settlement: these abound
all parts of the island, and are of various sizes, stand-
g sometimes singly, sometimes so as to form a chain
f posts; and frequently may be seen a large head rath,
here the chieftain lived, and its smaller dependent
aths, on which his retainers dwelt.

Amongst the earliest and peculiar antiquities of Ire-
and, are the low *Stone-roofed Buildings*, with high
dge-shaped roofs: of these, a few instances still exist
Kells, Kildare, Ardmore, and Killaloe. The most
markable relics of the olden times of Ireland are the
fty *Round Towers*, of which, perfect and imperfect, one
undred and eighteen have been enumerated in various
arts of the kingdom. They are built with a wonderful
niformity of plan. They are all circular, of small dia-
eter, and great altitude. In most of them the door
at some height from the ground; small loop-hole
indows, at distances in the sides, give light to the
aces where the different floors once were; and gene-
ally there were four larger-sized windows round the
p, immediately below the roof, which is high and
one-shaped. There are, however, two or three towers,
which it does not appear that there ever were any
indows round the top. Of the excellence of the
asonry, a proof was given some years ago by the
wer of Mahera, which, in consequence of having been
ndermined, was blown down, and lay, at length and
ntire upon the ground, like a huge gun, without break-
g to pieces, so wonderfully hard and binding was the
ement with which it had been constructed. Various
eories have been offered as to the purpose for which
ese mysterious buildings were erected; the only clear
oint seems to be that they were religious, as they are
lways placed near churches. They vary in height
rom 35 to 120 feet; the internal diameter from 10
16 feet, and the outer circumference from 46 to 56
et. Their tapering shape forms one of their most
arked characteristics.

Ancient weapons and golden ornaments are from
ime to time dug up in all parts of Ireland, as bronze
words, exactly like those discovered at Carthage and on
he field of Marathon. Multitudes, also, of spear-heads of
ll sizes, made of the same mixed metal, and curiously
haped bronze rings, have from time to time been dis-
overed, the use of which had long been a desidera-
um to antiquaries, when a recent event unexpectedly
hrew light upon the subject, and confirmed the con-
ecture of Sir William Betham as to their having been
urrent money. A variety of golden articles have been
iscovered in many parts of the country, such as semi-
unar shaped disks, formed of thin plates of pure gold;
orques, or large twisted collars for the neck; armlets,
rooches, rings, pieces of gold, bell-shaped, but solid
nd fastened together, the use of which has not been
ade out; and some rings of the same shape as those
f bronze, which have been proved by Sir William
Betham to have been used as money.

the middle classes, being of Saxon descent, are not much different from the same classes in Great Britain; but, in as far as any difference exists, it may be said to consist in a tincture of the Celtic, or genuine Irish character, as just described. This admixture is perhaps that which gives the educated Irish so much artistic talent, whether to be exhibited in literature or the arts, while some of the more peculiarly English characteristics are less conspicuous.

Limiting the consideration of the social state of Ireland to what is peculiar to it, we may first advert to a conspicuous practice of the landowners—*absenteeism*. By absentees are not meant those noblemen, who, being Englishmen, have also large possessions in this country, and whose estates (with some glaring exceptions) are usually well and justly managed; but those sons of Erin who prefer living in any other country to remaining in their own, although it is at home only that a man receives his just meed of respect. This system of absenteeism has led to that of *middlemen*, who hold large tracts of land from the head landlord, and relet this land at a much increased rent to farmers; these, again, set to a third set of under-tenants at rack-rents; and this lowest grade of tenantry divide their small farms among their sons, thus creating a race of farming poor, who are unable to till their holdings properly, and miserably increasing a population raised but a step above the pauper. There is perhaps no more thriving person than the *farming-landholder*, who, contented with his condition, rises with his labourers, holds his own plough, and superintends the management of his farm; but the state of the *cottier* is often far from being a happy one. The discomfort of this class may be said to arise chiefly from three causes—low wages, high rents, and, most of all, from the want of steady employment. The too great subdivision of land, as will be shown, in treating of the condition of the peasantry in the provinces, is another cause of the general poverty and want of comfort of the cottier. Under the excitement of war prices and the free trade in corn with Great Britain, agriculture advanced rapidly, and, consequently, so did the demand for labour; land rose in value, lessees were tempted to realise profit-rents by subletting their farms; and thus a class of middlemen was created, by whom the land was let in still smaller divisions, and at extreme rents. This system was an absolute bar to the encouragement which might have been given to the tenantry by the proprietors of estates. The occupying landlord pays a higher rent to the middleman than does the middleman to the proprietor, because the middleman exacts as much as he can get, without any reference to the future situation of the tenant: but the landlord has different feelings—he looks forward, and considers the reversionary interest which he has in keeping his tenant in prosperity, and his land in a state to yield a remunerating profit.

The habits of getting credit frequently at an advance of 50 per cent., of resorting to pawnbrokers, and of forming early marriages, contribute to the impoverishment of the labouring classes in Ireland. The poorer the individuals are, the more eager are they for wedlock; even the very beggars intermarry. It must, however, be admitted as some excuse, that early marriage is much encouraged by the Romish priesthood; and in fairness it must be added, that this practice contributes exceedingly to the morality of the lower classes. The superstitious regard to *wakes* and funerals, which has been handed down from ancient times, is often a deplorable drain on the slender resources of the peasant.

In considering the character of the Irish peasantry in general, it is refreshing to see some noble traits standing out in full relief against the darker shades. The Irish people are of acknowledged bravery, proverbial hospitality, affectionate to their parents and aged relatives, charitable to the mendicant, and evincing in many places, even under extreme distress, a decency of feeling, which renders them averse to soliciting eleemosynary assistance. The women, generally speaking, are modest and irreproachable in their conduct; and it added, that, notwithstanding the crime and w ness which oppress the country, the poor Irish from some species of vice which are but too in other countries. During the hay and corn of England and Scotland, the services of the bourers are very important. They are general well-conducted, and inoffensive; labouring h living hard, that they may bring their earnin to pay the rent of their little farm or dwell *spalpeen*, or harvest-man, carries home from eight or ten pounds; to do which, he is content away, almost to starve himself. There is reaso fore, to hope, that under a better state of th national character would rise to a standard muc than it has yet attained; and improvement ma ably be expected from the happy change wroug years by the temperance societies, and espe the Roman Catholic clergyman, the Rev. T. of which evidence was given in the Ballinaslo 1840, where, instead of twelve hogsheads, the usually disposed of, it is believed that there w eight gallons of whisky consumed.

The last, but by no means most miserabl Ireland, is that of the common *vagrant*. some are beggars by profession; some are obli loss of employment, to become what are called and others are mendicants for a time only, their husbands are reaping the harvests in at which time it is customary to lock up the h the wife and children *walk the world* until th ler returns with his little hoard of hard-earne It may be asserted, that in every district of excepting some peculiarly circumstanced po Ulster, there is a feeling of respect towards me which tends to support and perpetuate it. tenants of the cabins receive the wanderers, single or in groups; and carrying, as these bedding along with them, a warm corner is them, even in the only room possessed. " humblest sort," say they, " that are really goo The vagrants that frequent fairs, markets, holy wells, and other places of religious or pl resort, are better off than the other poor. A able evidence declared to the commissioner Poor-Law Inquiry in the county of Meath, beggars at fairs were " as jolly a set as ever his life;" and in more places than one, it was the commissioners that the beggars were bette the tradesmen or labourers.

Hitherto, the usual methods of supporting th poor have been congregational collections, tions, very extensive private charity, and of l the application of the resources of the Mendi ciation; but the inefficiency of these means l mately led to the establishment of a *Poor-La* neral object of which is to relieve the destituti country. Under this system, assistance is pr be afforded to persons only in the workhouse respective parochial unions, which are now throughout Ireland. It is calculated that a workhouses, placed in the centre of so man and capable of containing each from four to e dred persons, will be sufficient to accommodat are likely to apply for admission. For the l gulation of the system, it was enacted, that a guardians should be annually elected in each number according as the commissioners sha the same guardians being eligible for the su year. It appears that, so far as the poor-law as yet brought into operation, it is imperfect not relieved the districts in which it has bee into effect from the annoyance of mendicity, as there is no compulsory law for retaining in the poorhouses; they therefore leave then sure, to follow the more agreeable course of b the streets. Until such enactment be passed, it would seem, will be subject to a severe ta support of the poor-law system, while at the s

odation of a large population. In point of size, Dublin occupies a place between Edinburgh and London, and its appearance never fails to surprise and delight the stranger. In external aspect, it is essentially an English town, being built of brick in a neat and regular manner, but abounding in a class of elegant public structures of stone, which resemble the more substantial embellishments of Paris and other continental cities. The river, flowing from west to east, divides the city into two nearly equal portions, and is a striking feature in the general plan. The leading thoroughfares of the city are easily comprehended. First, from east to west, there is the double line of houses and quays bordering upon the river, the lower part of which forms a harbour, and is crowded with vessels. Crossing this line at right angles, is the great line formed by Sackville, Westmoreland, and Grafton Streets, the first and second of which are connected by Carlisle Bridge, the lowest in a range of eight or nine which span the river at various distances from each other, parallel to the quays, on the south side of the river, there is a shorter arterial line of great importance, formed by College Green, Dame Street, Castle Street, and Thomas Street, being terminated to the east by the buildings of the University. Though the ancient part of the city occupies the south bank of the river, there is a portion of the mean and elegant on both sides; the streets and squares of the wealthy being here, contrary to the usual rule, in the north-east and south-east districts. All the great lines are formed by houses of lofty and elegant proportions, chiefly devoted to commerce; and perhaps no city can present a more splendid series of shops and warehouses. Sackville Street, a hundred perches in length and six in width, with a noble monumental pillar in the centre, and some of the finest public buildings in the world leading it to their effect, must impress every one as something worthy of a great city. The spaciousness of several of the squares in the aristocratic districts is equally impressive. Merrion Square is half, and St Stephen's Green nearly a whole mile, in circumference, the latter containing seventeen acres of pleasure-ground in the centre.

Dublin.

On first walking into the streets of Dublin, the stranger is apt to see, in the throng of carriages and foot-passengers, nothing more than what he expects to find in all large cities. He soon observes, however, that, besides the luxurious class who occupy the better kind of vehicles, and the busy well-dressed crowd who move along the foot-ways, there is a great multitude of mean and mendicant figures, such as are only to be found in a small proportion in other cities. This is the very first peculiar feature which the stranger detects in Dublin, and it is an unfortunate one. It is explained when we learn, that, of the large population of Dublin—supposed to approach three hundred thousand—fully three-fourths are beneath what is recognised in Britain as the middle rank. Thus the most respectable streets in Dublin, and the most elegant figures which appear in them, seem isolated in the midst of penury and meanness.

The public buildings of Dublin boast an elegance much above what might be expected from the general

Ecclesiastical Antiquities.—Under this head rank those buildings which may be considered as the most ancient, after the Pagan remains, and which bear a peculiar character, differing from that of any extant elsewhere. Of these but few are now in existence. The stone-roofed church of St Doulagh's, near Dublin, belongs to the earliest date; its plan and style are equally uncommon. The latter seems to have been a rude approach to the oldest Norman; it is low, and of great strength; the church, divided by a low-browed arch, seems to have had a small choir and a somewhat larger nave. There are also, strangely disposed, at various heights, small chambers, apparently for the residence of the clergy. A part of the building is used as the parish church; and the old tower has borne the addition of a belfry, so excellent was the mason work. The beautiful and curious ruin at Cashel, called *Cormack's Chapel*, is Norman in character, and was probably the cathedral of that diocese previous to the English invasion. It is considered to have been built in the tenth century by Cormac, who was both king and archbishop. He died about A. D. 990. It is to be observed, that both here and at St Doulagh's, are crypts placed *over* the churches—a peculiarity known in Ireland only; the crypts in all other countries being underneath. In this very marked Irish-Norman style, there exist a few remains at Aghadoe near Killarney, at Clonathen in the county of Wexford, and near Bannow in the same county, in an ancient town, which having been, time out of mind, overwhelmed by the blowing sand from the coast, has only within a few years been discovered, but, protected by the sand, is in a high state of preservation. The peculiar character which marks these buildings, proves them to be examples of the Irish style subsequent to the age of the towers, and previous to that brought in by the British invaders. Ireland cannot boast of any ecclesiastical buildings of great richness or beauty; but there are some of respectable appearance. The two cathedrals of the capital, St Patrick's and Christ-church, are at least elegant in the interior. The large cathedral of Galway, and that of Limerick, are both handsome buildings, as is the cathedral of Kilkenny. These are all in good order, and in daily use. There are numberless ruins of monasteries, abbeys, knights' preceptories, and churches, of which the chief are—*Kilcooney Abbey*, in the county of Galway; *Corcomroe*, in Clare, the finest ruin in Ireland; *Holy Cross*, in Tipperary; the *Old Cathedral*, on the Rock of Cashel; *Dunbrody* and *Tintern Abbeys*, in Wexford; *Jerpoint*, in Kilkenny; and *Lusk*, in the county of Dublin. Kilcooney and Lusk are remarkable for their basso-relievos in stone, which bear a degree of resemblance to the Egyptian hieroglyphics. Many of these still retain fragments of their former ornaments of fretted stone work—Holy Cross in particular.

Military Antiquities.—The traveller in Ireland must be struck with the vast numbers of small castles, which crowd the whole country. They chiefly bear date about the reign of Elizabeth, by whose orders they were raised, as strongholds to overawe the wild Irish. They are usually high and square, with towers at each corner. Besides these fortalices, there are ruins of very large castles, so customarily attributed to King John, as to show that they were built in the early times. Of these the extensive ruin at Trim, in the county of Meath, affords a fair example, as being one of the largest, and formerly the residence of the viceroy or chief-governor. Parliaments were held within its walls, and money minted there as late as Charles I. A few of the ancient castles belonging to the old nobility, still continue to be inhabited, as *Malahide*, Lord Talbot's de Malahide, and *Howth*, the Earl of Howth's, both in the county of Dublin; *Strokestown*, the residence of Earl Count; *Portumna Castle*, on the Shannon, that of Lord Clanricarde; *Killaloe Castle*, the seat of the Marquis of Downshire.

[illegible]

[illegible] of Ireland, and contains the [illegible] Wexford, Carlow, Kilkenny, Kildare, Queen's County, King's County, Westmeath, and Longford, t forming a large tract of country on the east si island, and having Dublin at a central poin coast. The scenery of Leinster is much vari county most remarkable for picturesque beau of Wicklow, a short way south of Dublin; the hi and valleys are here rich in natural wood, and, by an extensive prospect of the ocean, can l exceeded in beauty. The principal points of i for tourists are Lough Bray, a woody ravine Dargle, and the Vale of Avoca, which is one ous piece of sylvan pleasure-ground. Wex farther south, may also, to a considerable e described as a picturesque and fertile coun though the county of Meath is for the most and tame, except along the banks of the B Blackwater, it can boast there of some sp deeming beauty, as an example of which, *B* the beautiful demesne of Gustavus Lamb may well be mentioned; and in a large porti county the quantity of wood and the rich h give an almost English character to the l Westmeath is remarkable for expansive lake the dry gravelly hills which give variety to it The Queen's County, though a good deal disf bog, yet boasts, at Abbeleix and Dunmore, stretch of magnificent natural oak wood. Th ing part of Leinster cannot be considered i or peculiar in its general features. The King contains the greatest portion of the flat flo the eastern side of the Shannon; towards where the Slieve Bloom Mountains terminate some fine scenery, especially about the anci of Leap.

Leinster may be considered as much super other provinces with respect to agriculture; parts of Carlow, Kildare, and Wexford, are in a manner approaching in skill to that of th tural districts of England and Scotland. implements, rotation of crops, and the indu which manure is collected and composts manu there is a great and increasing improvement. societies, ploughing matches, and premiums fo better breeds of cattle, have greatly tended t creasing prosperity; and they only who have what these districts were previous to the U appreciate the amelioration which has since tal

In Kilkenny and its vicinity, the blanket t carried on to some extent, but latterly it has very declining state. Near Dublin are some paper manufactories, and in the county of M large flax-mill. Generally speaking, however, but few manufactures in Leinster. There is chief towns a considerable export of agricult duce.

The counties of Wicklow and Wexford e industrious and thriving population; and be dustrious, the people are able to pay, from superior to those of other districts, rents whi be intolerable in other parts of Ireland. The peasantry are reckoned the finest in the world proverbial for their handsome features and fin profiles, and still more so as being a respectf and well-conducted people. The county of remarkably fertile; but being less subdivided, fore less populous than any other part of Irel sidering the richness of its soil. The same p as that in Wicklow and Wexford, though per smaller degree, prevails in Kildare, Carlow, Queen's County. One of the chief causes of sperity is, that a large portion of the populatio money payments for their daily labour, and that the *cottier* and *con* or *corn acre* systems less resorted to. The wages of Leinster are shilling a-day in summer, and in winter fro pence to tenpence, without diet. The aver for arable land is from £1 to £1, 10s., and for land from £2 to £3 per acre. The general d

dition of a large population. In point of size, Dub- occupies a place between Edinburgh and London, d its appearance never fails to surprise and delight stranger. In external aspect, it is essentially an glish town, being built of brick in a neat and regular nner, but abounding in a class of elegant public ctures of stone, which resemble the more substan- embellishments of Paris and other continental ies. The river, flowing from west to east, divides city into two nearly equal portions, and is a strik- feature in the general plan. The leading thorough- es of the city are easily comprehended. First, from t to west, there is the double line of houses and ays bordering upon the river, the lower part of which rms a harbour, and is crowded with vessels. Cross- this lies at right angles, is the great line formed Sackville, Westmoreland, and Grafton Streets, the st and summit of which are connected by Carlisle idge, the lowest in a range of eight or nine which an the river at various distances from each other. rallel to the quays, on the south side of the river, re is a shorter arterial line of great importance, med by College Green, Dame Street, Castle Street, d Thomas Street, being terminated to the east by the ldings of the University. Though the ancient part the city occupies the south bank of the river, there a portion of the mean and elegant on both sides; the vels and squares of the wealthy being here, contrary the usual rule, in the north-east and south-east dis- cts. All the great lines are formed by houses of ty and elegant proportions, chiefly devoted to mer- rce; and perhaps no city can present a more lendid series of shops and warehouses. Sackville reet, a hundred perches in length and six in width, th a noble monumental pillar in the centre, and some the finest public buildings in the world lending it eir effect, must impress every one as something rthy of a great city. The spaciousness of several of e squares in the aristocratic districts is equally impres- re. Merrion Square is half, and St Stephen's Green arly a whole mile, in circumference, the latter contain- g seventeen acres of pleasure-ground in the centre.

Dublin.

On first walking into the streets of Dublin, the ranger is apt to see, in the throng of carriages and ot-passengers, nothing more than what he expects find in all large cities. He soon observes, however, at, besides the luxurious class who occupy the better nd of vehicles, and the busy well-dressed crowd who ove along the foot-ways, there is a great multitude mean and mendicant figures, such as are only be found in a small proportion in other cities. This the very first peculiar feature which the stranger tects in Dublin, and it is an unfortunate one. It is plained when we learn, that, of the large population Dublin—supposed to approach three hundred thou- nd—fully three-fourths are beneath what is recog- sed in Britain as the middle rank. Thus the most spectable streets in Dublin, and the most elegant gures which appear in them, seem isolated in the idst of penury and meanness.

The public buildings of Dublin boast an elegance uch above what might be expected from the general

character of the city. In sailing up the river, the eye is first attracted by the Customhouse, a large and splendid edifice in the well-known taste of the Adams, surmounted by a dome, and very happily situated upon the north quay. The Post-Office, in Sackville Street, is in that graver form of the Grecian style which has more recently come into favour, extending above two hundred feet in front, with a noble portico surmounted by a pediment. The simultaneous starting of the mail-coaches at a certain hour every evening from the court of this building, is one of the sights of Dublin. Opposite to it is a pillar in honour of Nelson, surmounted by a figure of that hero. At the upper extremity of Sackville Street is the Lying-in Hospital, a beautiful building, with which is closely connected the more celebrated Rotunda, together with an extensive plot of ornamental ground. The Four Courts—also a most superb structure—overlooks the river at a point considerably removed to the west, and completes the list of remarkable buildings in the northern division of the city. To the south of the river, the objects worthy of especial notice are more numerous. The buildings of the University (founded by Queen Elizabeth in 1592) occupy a conspicuous situation on the great transverse line of streets which has already been mentioned. Beneath an elegant Grecian front three hundred feet in length, an archway gives admission to a succession of spacious squares, chiefly composed of brick domestic buildings, and containing a theatre for examinations, a museum, a chapel, a refectory, a library, and other apartments necessary for the business of the institution. In the museum is preserved an ancient harp, generally represented as that of Brian Boroimhe, a famous Irish king of the tenth century. There are usually about two thousand students in attendance at the University. Divided from this building only by the breadth of a street, is the Bank of Ireland—formerly the place of assembly of the Irish Houses of Parliament. The deep colonnaded front of this building is one of the most beautiful pieces of architecture, not only in the British dominions, but in the world: it carries a charm like a fine picture. The hall where once the Commons of Ireland assembled—where the eloquence of a Grattan, a Curran, and a Flood, was once heard—is now altered to suit the purposes of a telling-room; but the House of Peers remains exactly as it was left by that assembly, being only occasionally used for meetings of the Bank directorate. The latter is a small but handsome hall, adorned with tapestry representing transactions in the subjugation of Ireland by King William—the battle of the Boyne, the breaking of the boom, and so forth, as also a few appropriate inscriptions.

In Kildare Street, at no great distance from the College and Bank, the halls of the Royal Society of Dublin present a powerful claim to the attention of strangers, in the great variety of curiosities, pictures, and models, with which they are filled. In a perambulation of the city, the Castle is the next object worthy of notice. This ancient seat of the viceregal government, to which rumours of plots and insurrections have been so often brought by terror-struck spies or remorseful participators, is placed on slightly elevated ground, in the midst of the old or southern division of the city. It consists of two courts, containing certain public offices, and the apartments of state used by the Lord-Lieutenant. In the lower court is the Castle Chapel, a beautifully constructed and beautifully furnished modern Gothic place of worship, the whole materials of which are of Irish production, and which cost above £40,000. The service performed here every Sunday forenoon, graced as it is by the finest vocal and instrumental music, while a rich "religious light" streams through stained windows, and is reflected from the gorgeous stalls of civil and ecclesiastical dignitaries, is one of the most attractive things in Dublin. The state-apartments of the Viceroy are in the taste of the middle of the last century, and are elegant, but not remarkable for grandeur. In one is a bust of Chesterfield, who was Lord-Lieutenant in 1745. The most remarkable room is the ba denominated St Patrick's Hall, which is spaci lofty, and among other attractions has a ceilin mented with pictures, representing transaction history of Ireland.

In Ireland, old ecclesiastical structures are more curious for their antiquity than their Accordingly, the exterior of St Patrick's and church, the two cathedrals of Dublin, is apt t ungainly to an eye fresh from Westminster or In the former building, nevertheless, the in the choir, in which service is usually perfor impress every mind by its lofty proportions, pous monuments, and the dark stalls and nic mounted with the helmets and banners of the of the order of St Patrick. In visiting this church, the predominant thought is—SWIFT. for his dwelling as we approach, and for his to we enter—such is the power which genius has the feelings of men for all time upon every thing connected with it! The deanery still St Kevin Street, containing the portrait of Sw which all the engraved likenesses have been The streets immediately surrounding St Patr thedral are the meanest and vilest in the ci houses have a ruinous and forlorn look, and t ments are crowded with a population of t wretched order. These streets are filled wit but the trades to which they are devoted serv to betray the misery than to manifest the co the people. Dealers in old clothes, pawnbroker dealers, and persons trading in offals, almost kinds of animal food indulged in by the lowe of the people, abound.

At the western extremity of Dublin, on th side of the river, is the celebrated public pr denominated the Phœnix Park, said to consist a thousand acres. Not only does this park gr ceed those of London in extent, but it is ques if even the Regent's Park, after all the exp curred in ornamenting it, will ever match this in beauty. The ground is of an undulating ch and is covered with groups of fine old tim shrubbery, amidst which are the domestic re of the Lord-Lieutenant and his principal officers some other public buildings, and a tall obelis nour of the Duke of Wellington's victories. gical garden has lately been added to the othe tions of the Park.

Dublin was formerly a busy literary mart, i quence of the state of the copyright law, which of cheap reprints of British books being here After a long interval, the activity of its publis lately revived, and there are now several house afford considerable encouragement to native among others, those of Mr Tims and Mr Mil Grafton Street, and that of Messrs W. Curry, J Co., in Sackville Street. The latter has had th of for the first time establishing a respectable cal work in Ireland, the *Dublin University M* which has been carried on with increasing su a number of years.

Dublin possesses a number of beneficiary inst conducted on a scale of great liberality; also religious and educational societies, whose op are extended over the whole kingdom. The tr ried on in the town refers chiefly to home c tion; and, excepting tabinets or poplins, it is tinguished as the seat of any manufacture. very little foreign export from Dublin. Its p imports are—timber, from the Baltic; tallow and tar, from Russia; wine and fruits, from Spain, and Portugal; tobacco, bark, and spice Holland; and sugar, from the West India islan

The most important branch of its commerce carried on with England, chiefly in connexi Liverpool, to whose market there are now la ports of native produce. Though the Liffey fo harbour of the port, vessels of large burden, an

k cotton cloth, timber, leather, tobacco, salt, and
n. Drogheda contains three Episcopal churches—St
ter's, St Mary's, and St Mark's, which is a chapel
ease to St Peter's; four Roman Catholic chapels,
monasteries, and a friary. The chief civic build-
gs are a handsome tholsel, custom-house, tri-weekly-
ket, jail, and linen-hall. The town does not bear
literary character: it has, however, four tolerably
d booksellers' shops and a reading-room: there is
o a mechanic's society in Drogheda. Its principal
nufactories are a flax-mill, two foundries, salt works,
distillery, three breweries, one of which, belonging to
Cairns, is celebrated for the superior quality of its
, which is in constant demand in the English and
eign markets. There are, besides, several large
ar-mills, and a soap and candle manufactory. There
a salmon-fishery on the Boyne, close to the town;
d cod, haddock, plaice, soles, and gurnets, are abun-
ntly caught along the coast. The linen trade is still
rried on in Drogheda, though it is at present in a very
pressed condition. The time of its greatest prosperity
s from 1814 to 1820, during which period 4000 pieces
linen were averaged to be the weekly product. There
s also a temporary revival of the cotton trade in this
wn; but in the commercial panic of 1825-6, many of
Drogheda weavers passed over to Manchester and
dham, others went to France, and a large body emi-
ated to America, in consequence of which the cotton
siness ceased. The population in 1831, was 17,[illegible].

MUNSTER.

Munster contains six counties, *Clare*, *Cork*, *Kerry*,
merick, *Tipperary*, and *Waterford*, and may be con-
dered as that part of Ireland in which the national
aracter, and the national habits of all kinds, are
intained in their greatest purity. Some of the largest
ats of population in the island, as the cities of Cork,
aterford, and Limerick, are situated in Munster. The
ovince contains many tracts of beautiful scenery, and
e in particular, which is allowed to be unequalled in
e kingdom—the celebrated lake district at Killarney.
The *lakes of Killarney* are situated in the bosom of
e mountainous county of Kerry, and are annually
ited by travellers from all parts of the island, as well
from neighbouring countries. They are three in
mber, of unequal size, and considerably varied with
spect to surrounding scenery, though that may be
scribed as generally of a mountainous character.
ugh Lane, or the Lower Lake, by far the largest of
e three, is skirted on one side by the level and well-
ltivated country surrounding the pleasant village of
llarney; on the other side rise the Glena and Tomies
ountains. In this lake there are a number of wooded
ands, one of which contains the ruins of an abbey,
d another the remains of an ancient castle. On the
ore, towards the east, is the beautiful ruin of Muck-
ss Abbey. Divided from the Lower Lake by the fine
oded promontory of Muckross, but accessible by two
annels of level water, is the Middle Lake, called also
rk Lake, from the name of the mountain at whose
ot it reposes. Over and above the islands which stud
e surface, the beauty of these two sheets of water may
said to consist in the irregular promontories and
pes, generally wooded, by which they are surrounded,
d above which the mountains tower in sterile gran-
ur. In many nooks of the scenery, elegant mansions
ok out upon the lakes; in others the mountain streams
e seen descending in glittering cascades. The Upper
ke, the third of the series, is three miles apart from
e middle one, on a higher level, and totally embosomed
idst the hills. A stream descending from the one to
e other can be passed in a boat; and, at a particular
ace on the passage, it is common for tourists to have
bugle played, in order to enjoy the oft-repeating
hoes which it awakes in the neighbouring hills. The
pper Lake, having the wooded heights of Dericunighy
one side, the round-headed Purple Mountains on the
her, and, at the head, the bare many-coloured ridge
Macgillicuddy's Reeks, while the surface is broken

by a variety of sylvan inlets, presents a landscape of enchanting loveliness. In connexion with the lakes, there is a narrow rugged vale, named Dunloe, which is usually taken in by a tourist in a survey of this fine scenery.

Amongst other beautiful places in Munster, we can only particularise Glengarriff, a rugged and most picturesque vale near the head of Bantry Bay; the banks of the Blackwater, between Lismore and Youghal; the River Lee, below Cork, and the fine natural harbour (the *Cove of Cork*) in which it terminates; and the lofty iron-bound coasts of Clare, amidst which are some scenes of uncommon grandeur.

The soil in the southern parts of Limerick and Tipperary is perhaps not inferior in fertility to any portion of Europe. The Corkass lands of the former, and the Golden Vale of the latter, are celebrated for their extraordinary richness. These districts are chiefly appropriated to the feeding of black cattle. Wheat husbandry is cultivated throughout the limestone districts of Tipperary, Clare, and Limerick, while dairy farming is followed in the mountain districts of Kerry and Waterford. The potato culture necessary to supply the wants of an over-dense population, is eagerly pursued throughout the whole province; and it is a deplorable fact, that a large portion of that population have no other food during the greater part of the year. The grass farms let in large divisions of from 150 to 400 acres, at from 40s. to £3 per acre. In the dairies of the county of Cork, the great butter country of Munster, it is no uncommon thing to have from one to two hundred cows in profit; the advantage of which is, that a cask is filled at once by butter all of the same churning. The sweet thick cream only is churned, and that every morning. The pastures of these dairy-farms are highly manured, and are never broken up for tillage, experience having taught the dairy farmers that the older the sward the richer is the milk. Some of these grass lands have not been ploughed for a hundred and fifty years.

Daily labourers are usually paid from 8d. to 10d. per day; or, if engaged by the year, from 6d. to 8d. In the latter case, it is supposed that the labourer has a house, and grass for a cow, at what is called a moderate rent, and which, in the estimation of the labourer, is equivalent to additional wages. The food of a great part of the Munster peasantry consists of potatoes; to this is usually added milk, and, if they live near the sea, hake or herrings. In Cork, but few of the labouring poor have cows, because milk can be had in abundance at a moderate price at the dairies. It is, however, very customary to have ewes, which not only supply a tolerable quantity of milk, but furnish clothing. The women spin and dye the fleeces, and have them woven into thick frieze, and fulled at the village fulling-mill: from this practice, the southern Munster men are remarkably well clothed. The cottages, or rather cabins, are, generally speaking, wretched; but it may be stated, that in the dwellings and furniture of the people there is a growing improvement. The character of the Munster peasantry may be considered as of mixed good and evil—the evil arising from a total want of restraint in early childhood, bad education, or, as frequently happens, none at all. Female education is peculiarly neglected; and it is deplorable to see marriages contracted when the wife has few capabilities for managing a family, and rendering her husband comfortable, or his house a happy home.

Generally speaking, the trade of Munster consists in the export of provisions and agricultural produce, as wheat, oats, and potatoes, to a large amount.

There is on the Shannon an active fishery for trout, herrings, &c., and abundance of excellent fish are sent into Limerick, Ennis, Kilrush, and to the county of Kerry. Along the coast of Cork there is a fishery for pilchards, herrings, and other kinds of fish, which are caught in great quantities, so that frequently the farmers manure the fields with sprats.

of Towns.

The leading t[illegible] of Munster are *Cork*, *L*[imerick] and *Waterford*. [illegible] *Cork* is derived from t[he] word *Corcah*, whic[h] [illegible]fies a marsh. This city ranks as the second in Ireland with respect t[o] lation and commercial importance, stands on th[e] Lee, which, through several channels, pours it[s] into the harbour, from whence the tide flows [a] distance above the town. The streets are bu[ilt] the river channels, which, being all quayed, [are] y somewhat of a Venetian character: of la[te] wever, the narrower have been arched over, [and] main streams, in which the merchant ve[ssels] open.

The Episcopal ecclesiastical buildings of Cor[k] seven parish churches, the Cathedral of St F[in] Luke's Chapel of Ease and Free Church, th[e] the Foundling Hospital, and the Church of St [John] at Blackrock: two other churches are in [the] There are four Roman Catholic chapels, three [of] nearly completed, and four friaries. There ar[e] rous dissenting chapels—two meeting houses [of] leyan Methodists, one for the Primitive Wesley for Anabaptists, two for Presbyterians, one Society of Friends, and two for two other sects of dissenters. A new Scotch church is in [the] The principal public buildings are, the Bishop's which stands on a height overlooking the town jail, a little to the west of the city; the Custo large and handsome barracks, the City Libr Reading-Rooms, the infirmaries, the Chamber merce, the Steam-Packet Office, and a well-b spacious court-house, having in front a portico ported on six Corinthian columns and surmou an emblematic group of colossal figures. There in progress a new savings' bank, an extensive a mental building, but not more than half erecte a new banking-house of cut stone for a branc of Ireland; a new and showy corn-market hou an extensive workhouse for the Poor-Law Union three-quarters of a mile from the city.

Cork boasts of many schools—the Blue-Coat B for twenty-two sons of reduced Protestants; the Coat Hospital, for twenty children of each sex brought up Protestants; the Cove Street Infant san, Lancastrian, and Female Orphan Schools; cesan schools for the united diocese of Cork an and a free school founded by Archdeacon Pom

Among the charitable institutions in this cit Bertridge's Charity, where are maintained se Protestant soldiers; Skiddy's Almshouse, where aged women receive £29 yearly; Deane's School forty poor children are clothed and taught gratis is, besides, a masonic female orphan asylum, an ral almshouses. Indeed, in proportion to its s wealth, the city of Cork bears a peculiarly hi racter for benevolence.

There are five societies here, whose objects most entirely scientific—the Royal Cork Ins the Cuvierian, the Scientific and Literary Socie Mechanics' Institute, and the School and Lib Cook Street; one public subscription, and sev culating libraries; eighteen Protestant societ voted to religious purposes; four benevolent s for the relief of the distressed; five philanthr cieties, two lunatic asylums, and a school for i ing the deaf and dumb poor in George's Street.

The chief exports of Cork are grain, butter and provisions; its chief imports, wine, tea, sug coals. From the parliamentary returns, it that, during the five years ending 1834, the annual number of vessels entering the port c was—British, 135, tonnage 26,438; and forei tonnage 3384. Steam-vessels communicate Cork and Dublin, Bristol and Liverpool; and boats also ply daily between Cork and Cove. pulation of Cork, according to the census of 18 107,016.

the chief city of the west of Ireland, is the Shannon, near the place where that expands into an estuary. It consists of the w Town, respectively situated on the north des of the river, and connected by an ele- ı bridge. The new city contains many good d with handsome shops; but the old town dirty, decayed, and inhabited by a very ›pulation. Limerick contains a handsome some antiquity, situated in the old part of Episcopal churches and a chapel of ease, ses belonging to the Presbyterians, Inde- ıd the Society of Friends, with five Roman pels, three friaries, and one nunnery. The blic buildings are the Exchange, the City , the City and County Jail, the Police Bar- ıstomhouse, the Commercial Buildings, the the Market, and two banks. Though Lime- particularly literary city, it has an excel- ınd some very good booksellers' shops. The ıool at Limerick is the Diocesan, but there ivate day and boarding schools. There are able institutions, as the County Hospital; f Industry for the aged and infirm, widows, ung females, and deserted children; the Almshouse; Dr Hall's and Mrs Villiers's ł.

ard to the trade of Limerick, it has been at though it has increased with the exten- ity, it has done so by no means in an ade- ›rtion, when its peculiar advantages are the Shannon, which connects it with Clare, erford, and Tipperary, affording it innume- ›rcial facilities. The quays of Limerick are a scene of considerable bustle, though ented by vessels for the export of the native ›rovisions to the amount of 75,000 tons are l annually. The population of Limerick in imated to be 66,555.

', the chief town of the county bearing its ı large sea-port, is situated on the Suir, a ›m its junction with the sea. ULSTER.

northerly of the provinces is ULSTER, con- ›unties of *Antrim, Armagh, Cavan, Donegal, nagh, Derry, Monaghan,* and *Tyrone.* The Ulster is hilly. The scenery is in general especially in the vicinity of its chief towns, st, and Armagh. In the county of Antrim, from Glenarm to Bengore Head presents of striking and romantic views. The most eature of this scenery is the peculiar con- the basaltic columns with which it abounds, the arrangement is strikingly displayed in ınd the *Giant's Causeway.* Bengore, one ›ntories of the causeway, lies about seven f the little town of Ballycastle: though cribed as a single headland, it is composed ll capes and bays, each bearing its own ›, and of these capes the most perfect is he summit of Pleaskin is covered with a od, which lies upon the rock, the surface racked and shivered. About ten or twelve ı top, the rock begins to assume a columnar ıl standing perpendicularly to the horizon, presents the appearance of a magnificent colonnade, supported on a foundation of rock nearly sixty feet in height. About eight miles from Pleaskin is *Fair Head,* the easternmost head of the causeway, which presents a huge mass of columnar stones, of coarse texture, but many of them more than two hundred feet in height. Some of these gigantic stones seem to have fallen from the top, and now present to the eye of the spectator the appearance of groups of artificial ruins. The part which may more properly be called the *Giant's Causeway* is a kind of quay, projecting from the base of a steep promontory some hundred feet into the sea: it is composed of the heads of pillars of basalt, which are placed in close contact with each other, forming a sort of polygonal pavement, somewhat like the appearance of a solid honeycomb. The pillars are jointed, and their articulation curiously exact, the convex termination of one joint always fitting with precision into a concave socket in the next. Within about two miles of the Giant's Causeway stands Dunluce Castle, situated on the summit of a rock whose base is washed by the ocean, by the ravages of which great part of the building was suddenly swept from its foundation. The mansion and offices stand upon the mainland, divided from the fortress by a deep cut which separates the rock on which the castle is placed. Over this chasm lies the only approach to the building, along what was one of the walls of the drawbridge: should the passenger miss his footing on this narrow path, there is not the slightest protection on either side to save him from the abyss beneath.

The soil of Ulster varies much. In the counties of Armagh, Down, Antrim, Derry, and Monaghan, it passes from a deep rich fertile clay to a dry sandy or gravelly loam; while in Donegal, Tyrone, Fermanagh, and Cavan, a great proportion of it is cold, wet, and spongy. Tillage is, in general, in an improved state throughout this province; and, though the old Irish plough and the slide car are still occasionally used in the remoter parts, many of the modern implements of husbandry have been introduced, especially in Down and Londonderry. The English spade has nearly displaced the long or one-sided spade; the angular harrow and the threshing-machine are much in use, and the Scotch plough has almost superseded the heavy Irish one. The corn crops most general are oats, here, barley, and a small proportion of wheat. Barley is in Derry said to pay the summer's rent, and flax the winter's. Potatoes are largely planted by rich and poor, and gentlemen-farmers cultivate turnips and mangel-wurzel. Lime and peat are the most usual ingredients of the manure employed in the inland districts; while in the maritime counties, sea-sand, sea-weed of different sorts, and various kinds of shells pulverised, are used in addition. From the wetness of the soil, in some of the northern parts of Monaghan, the manure is usually carried to the fields in baskets, called *bardocks,* which are slung over asses' backs or the shoulders of the poor women. A small but hardy race of horses is reared in the island of Rathlin, or Raghery; and the old Irish sheep still prevails in and near Carey, in the county of Antrim. Pigs, goats, and donkeys, are numerous, the latter being much used in the counties of Cavan and Monaghan. A good deal of butter is sent to the markets of Belfast, Antrim, and Derry, from the various dairies scattered through Ulster.

Whatever were the manufactures of Ireland before the time of James I., they were swept away in the long series of wars between government and the local chieftains in the days of the Tudors; and the Scottish settlers in the north of Ireland, and those English whom Boyle, Earl of Cork, brought into Munster, may be considered the introducers of nearly all the manufactures that now exist in Ireland. During the reigns of Charles I. and II. much attention was paid to them; and the exertions of Lord Strafford, Sir William Temple, and the Duke of Ormond, caused the establishment of the linen trade to be attributed successively to each. The Duke of Ormond not only

procured several acts for its encouragement, but sent Irishmen to Flanders to be instructed in the details of the flax manufacture; and also established a linen factory both at Chapelziod, near Dublin, and at Carrick-on-Suir. In the reign of William III., the linen business rose to still greater importance, from the compact between the English and Irish merchants to discourage the woollen and promote the linen trade; for which purpose they procured a statute to be passed, levying additional duty on Irish woollen goods, from a jealous fear that the prosperity of the Irish woollen trade was inconsistent with the welfare of that of England. Another impetus was given to the linen trade by the emigration of the French manufacturers, after the edict of Nantes, of whom a large number took refuge in Ireland; and Mr Louis Cromelin, a leading manufacturer, obtained a patent for improving and carrying it on, and his efforts were crowned with considerable success. In the 9th year of Queen Anne, a board of linen and hempen manufactures was established, and linen allowed to be exported, duty free. In the 8th of George I., a grant was given to build a linen-hall, and another to encourage the growth of flax and hemp. Previous to 1778, bleached linen was sold in the fairs, the manufacturer being the bleacher; but when the manufacture extended, bleaching became a separate business. Considerable sums had been from time to time voted by Parliament for its support; and during the eighteenth century the trade continued to advance, until the check it received during the American war. On the re-establishment of peace it revived, and was at its greatest height from 1792 to 1796. Since this period it has considerably increased, and, though deprived of all artificial props, in the form of bounties, is now a flourishing department of industry. Belfast is the great centre to which the linens, not only of Ulster but also of the weaving districts in the west of Ireland, are sent for sale; and from hence large quantities are exported to foreign countries. The linen trade prospers at Castlewellan, Rathfriland, and Banbridge, in the county of Down, and also at Lurgan in the county of Armagh, where the weavers are at once weavers and manufacturers. At Dungannon, in the county of Tyrone, it has greatly declined, and is in Donegal chiefly confined to those who work for farmers or market sale.

The province of Ulster was also the seat of the first cotton manufactory introduced into Ireland. In 1777 the manufactures were in the lowest state of depression. To give them some stimulus, Mr Joy conceived the plan of introducing cotton machinery from Scotland; and a firm for this charitable purpose was formed, of Joy, M'Cabe, and M'Craken; and a mill for spinning twist by water was erected by them at Belfast in 1784, at which time the manufacture may be said to have been established; and so rapidly did it spread, that, in 1800, in a circuit of ten miles, comprehending Belfast and Lisburn, it gave employment to 27,000 individuals. But, from want of assistance at home to protect it, and the embargo laid on American goods, which inundated Ireland with English manufactures, the trade has declined, and the cotton manufacture is now almost altogether confined to the county of Antrim. Through the early part of the present century, it was carried on to a considerable extent in Drogheda, Collon, Strafford, Mountmellick, Limerick, and Bandon. Belfast was, however, the place where most skill and capital were expended; as the trade increased there, it declined in other parts of the kingdom; and, though large manufactories have formerly been established at Clonmel, Portland, and Limerick, it may for all practical purposes be considered as extinct in the other parts of Ireland.

No returns have been given since the year 1825, when the total number of pounds of cotton wool imported into Ireland was 4,065,930; and of cotton yarn imported thither from Great Britain in the same year, 41,953,156.

Wherever the linen trade is in operation, the people have constant employment, in consequence of being able to fall back upon their looms when agr work is not in demand. They may be said, in years, to enjoy a competency; that is, a suffi food, raiment, and fuel. But in the western Ulster, as, for example, the mountainous di Tyrone, Donegal, and Derry, where the line facture does not exist to any extent, the l classes are not much better off than in the th provinces. However, speaking of Ulster ge may be said the lower classes have more sel more industry, more desire for advancement in in other parts of Ireland. In fact, they ar educated, and therefore a more improving pe may be expected, their taste for comfort o the economy of their houses and farms; ar in the mountainous districts above alluded old habits still maintain their ground, the U santry may be considered as a respectable cl ciety. The average rent of arable land is from per acre, usually rising in the immediate neigh of towns to £5 or £6. The wages in Ulster 6d. to 9d. a-day in winter, and in summer to 1s. a-day, without diet. The food of the is chiefly potatoes, oatmeal porridge, oaten b and fish, which those who live near the sea that species of sea-weed called the edible *alg*

The salt-water fisheries of Ireland cannot have ever thriven. Under the former syst Irish Parliament, of giving bounties, large at different times voted for their encourage by this there was no real strength given, t withdrawal of these bounties, things fell b natural level, and the sea-fisheries became inefficient for any purpose but that of sup localities surrounding the fisherman's dwel fishery laws are now enforced with regard t sea and river fishing, and therefore there is believe that this branch of industry is on th and, if properly managed, will become one c means of benefiting the island. The rive though less productive than under better m they might have been, yet form in several par a lucrative source of property. The lakes abound with trout, pike, perch, eels, and ch the Bann, the Foyle, and the Ballyshannon i are established very successful salmon-fishe merly, whales were not unfrequently, and though but seldom, taken at the coast fishe province. The salmon-fisheries of the Foy Bann were early celebrated. In Phillips's are stated to have been let from 1609 t £666, 13s. 4d. a-year, for three years at eleven years at £1060, and for twelve years Easter 1639, at £800. The right of fishing Foyle, so far as Lifford, is vested in the Iri by the charter of Londonderry, granted by J 1613. The increase of the quantity of fish t the introduction of stake-nets is very co The salmon for exportation to London and to are packed with ice in boxes, 15 salmon, wei ther about 90 lbs., being put into each case. made to Sir William Petty about 1682, it is the fishing for salmon in the Bann River, all the salmon fisheries, begins with the 1st o ends on the last of July. But by the prese season now begins the 1st of February and e 1st of September, seven months being ope close. The Bann fishery has of late years neglected; but, under the spirited and judicio ment of Charles Atkinson, Esq., it has been proved during the last year.

Chief Towns.

The chief towns in Ulster are *Belfast*, a in the county of Antrim; *Londonderry* or *Coleraine*, in the county of Londonderry; the county of the same name; *Strabane*, in of Tyrone; *Armagh*, in the county of Arm *Newry* and *Lisburn*, in the county of Down.

The blind are employed in weaving and basket-
ing, and lately, by the introduction of raised letters,
have been instructed in reading. In 1824, there
in the town and parish sixty-three schools of all
s, at which 2152 males and 1656 females were edu-
d, exclusive of the Royal Academical Institution,
ch in 1823 contained 462 boys in its various classes.
Institution originated in 1807, in a voluntary sub-
ption of the inhabitants, by whom a fund was raised
bove £25,000, to which the late Marquis of Hast-
added £5000 for its erection and the endowment of
achers and professors. It consists of two depart-
ts, one elementary, the other for the higher
nches of science and literature. This establish-
t is directed by a president, four vice-presidents,
nty managers, and eight visiters, chosen by the
rietory. The chairs in the collegiate department
eight, embracing Divinity, Moral and Natural Phi-
phy, Logic, Mathematics, Greek, Latin, Hebrew,
a lectureship on Irish. The object of this aca-
y was to give cheap home education to those who
heretofore frequented the Scottish colleges. The
op of Ulster receives the general certificate of this
itution as a qualification for ordination, and it may
now considered the great seminary for the Presbyte-
Church in Ireland. The Belfast Academy had been
nded some time previously by private subscription.
f literary societies, Belfast possesses the Society
Promoting Knowledge, founded 1788; the Literary
iety for Improvement in Literature, Science, and
iquities, founded 1801; and the Natural History
ety, founded 1821. The town has lately received
valuable addition of a botanic garden, on a large
e, and laid out in an exceedingly tasteful manner.
as established and is wholly supported by the inha-
nts of Belfast, and affords a pleasing proof of their
it and liberality. The population in 1831 was
87, but this number is now considerably increased.

Londonderry ranks next to Belfast. Besides being a
port of considerable importance, it is the seat of a
op's see. It is situated on the west bank of the
le, a few miles above the point where that river
ads into the harbour of Loch Foyle, and is dis-
146 miles from Dublin. The original town, built
Sir Henry Dowera about 1603–4, was burned by
Cahir O'Dogherty in 1608; and the present city
be considered as deriving its origin from the Lon-
plantation, which was the immediate result of that
strophe. The walls of Derry are described by
nar as "excellently made, and neatly wrought; the
uit thereof about 284 perches, and in every place
wall being 24 feet high and 6 in thickness;" and,
r a lapse of more than two centuries, these fortifica-
s retain their original form and character. The
th-west bastion was demolished in 1824, to make
n for a market; and in 1826 the central western
ion was modified for the reception of Walker's Tes-
onial; but the guns used during the celebrated siege
still preserved in their original places. The total
ber of cannon remaining in the city and suburbs
bout fifty; and in the court-house yard stands
ring Meg, so called from the loudness of her report
ing the siege. This cannon is 4 feet 6 inches round
he thickest part, and 11 feet long, and is thus in-
bed—"FISHMONGERS, LONDON, 1642."

he chief of the ecclesiastical buildings is the Cathe-
. For nearly twenty years after its plantation,
ry was without a proper place of worship, part of
ruined church of Saint Augustine being employed
that purpose. At length a royal commission of
iry was appointed, which, in 1628, reported that
corporation of London had begun to build a fair
rch in Derry, and in 1633 its erection was com-
ed. This event is recorded in a tablet, which was
mally placed over the door of the porch of the old
edral, but is now over that of the belfry, bearing
following couplet:—

stones could speak, then London's praise should sound,
ho built this church and city from the ground.—A.D. 1633."

The other principal places of worship are—a chapel of ease, a free church, two Presbyterian meeting-houses, a Wesleyan chapel, a Primitive Wesleyan Methodist chapel, also Reformed Presbyterian, Seceding, and Independent chapels, and a Roman Catholic chapel, which can accommodate 2000 persons. The principal buildings in the city are the Bishop's Palace, the Public Library and News-room, the Lunatic Asylum, the Jail, and the Corporation Hall. Of its various manufactories, the chief are two great distilleries, and two corn-mills, one worked by a steam-engine of eighteen the other by one of twenty horse-power. The public schools in Derry are, the Diocesan, the Parochial, the Presbyterian, the Meeting-house, St Columb's, the Barracks, the Infant School; and besides these are many others, public and private. There is here a branch of the London Bible Society, the Londonderry Literary Society, and one for promoting religious, moral, and historical knowledge. There are also the Londonderry Farmers' Society and the Mechanics' Institution. The port carries on a considerable traffic, both with respect to imports of foreign and British produce, and exports. The estimated value of the exports of Irish produce is above a million sterling per annum. The population of Londonderry in 1831 was 10,130.

The city of *Armagh*, situated in an inland part of the country, is of considerable local importance. It is placed in the midst of a rich and beautiful district, the face of which is singularly varied by detached hills, some of which are more than a thousand feet in height. This character of country stretches from Lough Neagh in the north to the north-western part of the county of Meath in the south, and is well watered by lakes and streams, and, generally speaking, richly furnished with wood. The city stands on a hill, which is crowned by the old cathedral, around which the town has gradually arisen. Within these few years, several handsome buildings have been erected, with cut stone fronts—the Court-house, the Jail, the Presbyterian Church, Primate Stewart's Free School, founded and liberally endowed by him, and well carried on; the National School, and the Savings' Bank. The Cathedral has been re-edified within these five years, at an expense exceeding £30,000, in the pointed Gothic style, for the most part in very good taste; the organ is a remarkably fine one, and the choir excellent. The roads, in all directions, are admirable; and in the laying out of the new ones, they are carried round instead of over the hills. There is water-carriage from both Belfast and Newry by lake and canal, to within four miles of the city; the streets have flagged footways, and are well lighted with gas. About forty years since, the population was only 1000. It now amounts to 13,000. The Archbishop of Armagh, Primate of all Ireland, resides close to the town, as do also a large number of clergymen attached to the Cathedral, as well as many respectable gentry. Near Armagh stands the Observatory, built and endowed by Primate Robinson, whose munificence greatly contributed to the advance of science and improvement of the whole diocese. This noble institution is at present conducted by the Rev. Dr Robinson, Professor of Astronomy.

CONNAUGHT.

Connaught, the smallest of the four provinces, contains but five counties, those of *Leitrim*, *Roscommon*, *Mayo*, *Sligo*, and *Galway*. There are in this province large tracts of mountainous and sterile land, especially in the western parts of the counties of Galway and Mayo. The peninsula formed by the western part of the first of these counties is named *Connemara*, and is famed for its scenery, which somewhat resembles that of Argyllshire. It may be described as a vast tract of mingled bog, lake, rocky moorland, and mountain, bounded and partially penetrated by deep inlets of the sea, resembling the fiords of Norway. The principal lake is Lough Corrib, which is twenty miles long, full of islands, and surrounded by an extensive rocky desert, bearing no small resemblance to those of Arabi tween this lake and the western extremity of mara, there is a range of tall swelling green hills the Twelve Pins of Bunabola, and to the north is an estuary famed for its wild scenery, nam Killery, many miles in length, and connected Atlantic by a passage only thirty feet wide. Co contains a small, scattered, and primitive po unusually full of superstitious and old feudal Besides Clifden, a modern fishing-village on coast, there is scarcely any such seat of popu the district. There are, however, a few hot for the accommodation of the numerous tour flock thither in summer.

From the high grounds near Westport, is ob view of Clew Bay, a magnificent sheet of almost water, full of islands, and bounded by lofty m amongst which the most conspicuous are Patrick and Nephin. The islands of Clare a bound the scene towards the west. In some the weather, and particularly when a summe calmly descending on Clare, the view of Cle one of extraordinary beauty. The islands ar the common people to be as numerous as th a year, but in reality are only about a hundred. Patrick is regarded with superstitious feeling peasantry, as the spot where their tutelary accustomed to preach.

Amidst the great tracts of wild ground in Co there are a few other spots of an unusually character. The scenery round Lough Allen which the Shannon flows, is extremely pret also that near Boyle, at the foot of the Curle tains. At Lough Gill, near Sligo, a lake h strong resemblance to the upper lake of K and the little bay of Ardnaglass, into which cataract of Ballysedare, are scenes of peculia Much of the surface of Galway is flat, sho twenty miles together, a succession of narrow l rocks, like parapet walls of three feet high, parallels to each other, at distances of from ten feet: the intermediate spaces, though ap but a waste of rock and stone, supply the fin pasture in the kingdom.

The great central limestone district of Ire cupies the southern portion of this province, the eye, forms an exception to the general c of limestone countries, appearing so exceedi ren, that, in passing over tracts of Galway an the traveller almost doubts whether he is not ing over a great cemetery covered with tom rather than over places where the sheep ca pasture or the peasant plant potatoes. Th however, some exceptions to this prevailing for nowhere are finer sheep-walks found than parts even of the southern counties of Co The tillage of this province is principally con oats and potatoes, as best suited to the shallow tain bog-soil, which so largely prevails in the baronies. The extreme moisture of the clim inimical to the growth of wheat, that, except parts of Galway, Connaught cannot be said to own bread corn. There is a great export of potatoes from the ports of Galway, Westport, a With regard to husbandry, though it certain proving, it is yet much inferior to that of the ot vinces. The landholders pride themselves on t of long-wooled sheep, their great source of wea the celebrated Fair of Ballinasloe, where fro to 100,000 are usually sold, year after year ex improvement in this branch of rural economy. cattle, and horses, especially hunters, are a extensively in Galway. What has been said ster applies in a still more aggravated degree naught. The property of an absentee landlord i divided into portions ruinously small; and if prietors do not quickly interfere, deplorabl quences must result from the subdivision syste grazing farms are let in large portions, which

F IRELAND.

1835, the vessels entered inwards numbered 145, an aggregate burden of 12,915 tons; while the ves- s cleared outwards amounted to 145, with a tonnage 15,531. In 1840, a splendid dock was opened, from hich great expectations are formed of the increase of ade. A steamer in this bay is highly necessary, for wing out vessels in adverse winds. In 1831, the opulation of Galway was 33,120.

Across the country in a northern direction, and also uated at the head of a bay bearing its name, stands ngh, a town of a much smaller population than Gal- y, but more important as respects its commerce. has carried on for several years a considerable trade, th export and import, and is still increasing, not- thstanding the bad state of its harbour. The ex- rts are wholly limited to agricultural produce. The tail trade is extensive, articles of every description demand being supplied to a large and populous dis- ict. The streets in the older part of the town are rrow, dirty, and ill-paved, and badly suited to the stle of an export trade. But convenient markets ve been erected, and the extension of the town by gularly built wide streets, is expected to remedy e inconvenience and irregularity of the older parts. me good public buildings embellish the prominent nts in and about the town, and the River Clarewgue, ich bears the surplus waters of Lough Gill to the y, and turns several large flour-mills in its course, is fine feature in the scene. The suburbs are beautiful d picturesque. In 1831, the population was 15,152.

TRADE BETWEEN GREAT BRITAIN AND IRELAND.

The trade and general intercourse between Great itain and Ireland have been greatly increased since e Union in 1800, and more particularly since the tablishment of steam navigation on a large scale. e following statements on this branch of our subject e given by Mr Porter in his lately published work, The Progress of the Nation."

The value of produce and merchandise that have been e objects of trade between Great Britain and Ireland, various years since the Union, has been stated in pers laid before Parliament, as follows:—

	Imports into Ireland from Great Britain.	Exports from Ireland to Great Britain.
1801, - - - -	£3,270,250	£3,587,795
1805, - - - -	4,067,717	4,393,107
1809, - - - -	5,510,537	4,289,305
1813, - - - -	6,791,253	3,410,231
1817, - - - -	4,722,791	2,694,613
1821, - - - -	5,290,858	7,117,459
1825, - - - -	7,668,366	9,531,225

No account of this trade can be given for any year bsequent to 1825, the commercial intercourse between eat Britain and Ireland having at the end of that ar been assimilated by law to the coasting traffic rried on between the different ports of England; and, th the exception of the single article of grain (as to ich it was considered desirable by the legislature to ntinue the record), we have now no official register the quantity or value of goods or produce received m or sent to Ireland. That this traffic has greatly creased in all its branches there can be no doubt; and s increase may partly be attributed to the abolition the restrictions that existed up to 1825, but probably ll more to the employment of steam-vessels upon an tensive scale. To show the extent to which the ffic has been carried by this means, a statement s furnished to a committee of the House of Commons the manager of a company trading with steam-vessels tween Ireland and Liverpool, of the quantity and lue of agricultural produce imported into that one rt from Ireland in 1831 and 1832. From this state- nt it appears that the annual value of the trade was out four millions and a half sterling, which was in at part made up of articles that could not have been profitably brought to England by any previously sting mode of conveyance—such as live-cattle, horses, ep, and pigs; the value of which amounted in 1831

to £1,760,000, and in 1832 to £1,430,000. During the same two years the value of Irish agricultural produce brought to the port of Bristol averaged about one million sterling. The whole number of cattle, horses, sheep, and pigs, sent from Ireland to the various ports of England and Scotland, in different years from 1801 to 1825, was as follows:—

	1801.	1805.	1809.	1813.	1817.	1821.	1825.
Cattle,	31,543	21,862	17,917	40,973	45,391	26,725	63,519
Horses,	669	4,114	3,264	3,904	848	2,392	3,130
Sheep,	2,879	10,938	7,572	7,508	29,460	25,310	72,161
Pigs,	1,968	6,393	4,712	14,521	24,193	104,501	65,919

The numbers sent to Liverpool and Bristol alone, in 1831 and 1832, were—

	Liverpool.		Bristol.	
	1831.	1832.	1831.	1832.
Cattle, - - -	91,911	71,318	6,078	4,077
Horses and Mules, -	539	708	159	190
Sheep, - - -	169,487	98,337	11,640	4,446
Pigs, - - -	156,001	149,090	84,107	85,619

The statement above mentioned of the imports into Liverpool occasioned considerable surprise at the time it was made, from the greatness of its amount; but it would appear that this branch of trade has since gone on increasing in a most extraordinary degree, as will be seen from the following account of the number and value of live animals brought from Ireland to Liverpool in the year 1837:—

84,710 Black Cattle, at 16l. each, - -		£1,365,360
316 Calves,	45s. .. - -	711
225,050 Sheep,	40s. .. - -	450,100
24,632 Lambs,	18s. .. - -	22,202
385,422 Pigs,	50s. .. - -	1,488,555
3,414 Horses,	20l. .. - -	68,280
319 Mules,	8l. .. - -	2,552
	Total value, - -	£3,397,760

The average value here assigned to the several kinds of animals, is given on the authority of an intelligent gentleman resident at Liverpool, and who is practically acquainted with the trade.

The value in money, of one seemingly unimportant article, eggs, taken in the course of the year to the above two ports from Ireland, amounts to at least £100,000. The progress of this trade affords a curious illustration of the advantage of commercial facilities in stimulating production and equalising prices. Before the establishment of steam-vessels, the market at Cork was most irregularly supplied with eggs from the surrounding district; at certain seasons they were exceedingly abundant and cheap, but these seasons were sure to be followed by periods of scarcity and high prices, and at times it is said to have been difficult to purchase eggs at any price in the market. At the first opening of the improved channel for conveyance to England, the residents at Cork had to complain of the constant high price of this and other articles of farm-produce; but as a more extensive market was now permanently open to them, the farmers gave their attention to the rearing and keeping of poultry, and, at the present time, eggs are procurable at all seasons in the market at Cork, not, it is true, at the extremely low rate at which they could formerly be sometimes bought, but still at much less than the average price of the year: a like result has followed the introduction of this great improvement in regard to the supply and cost of various other articles of produce. In the apparently unimportant article feathers, it may be stated, on the respectable authority above quoted, that the yearly importation into England from Ireland reaches the amount of £500,000.

When, some years ago, it was determined to cease keeping any official record of the commercial intercourse between Great Britain and Ireland, an exception was made as regards grain and flour, that trade being of great personal interest to our legislators. The following statement exhibits the quantities of those kinds of produce sent to Britain from Ireland in each year from 1815 to 1836:—

Years.	Wheat and Wheat Flour.	Barley and Barley Meal.	Oats and Oatmeal.	Total, including Rye, Beans, Peas, &c.
	Qrs.	Qrs.	Qrs.	Qrs.
1815	120,544	27,108	597,537	821,191
1816	121,631	62,354	693,714	974,993
1817	50,025	26,766	611,117	699,309
1818	106,230	25,387	1,069,385	1,307,851

1822	463,004	22,532	669,237	1,063,962
1823	400,068	19,274	1,102,487	1,528,153
1824	356,408	45,872	1,225,085	1,634,094
1825	306,018	165,032	1,629,956	2,203,962
1826	314,851	64,895	1,303,734	1,612,189
1827	405,255	67,791	1,343,267	1,829,743
1828	652,584	84,204	2,075,831	2,886,135
1829	519,493	97,140	1,673,629	2,305,806
1830	529,717	189,745	1,471,252	2,212,729
1831	557,520	185,409	1,635,934	2,419,643
1832	572,596	123,068	1,890,321	2,606,734
1833	844,201	107,519	1,762,519	2,736,201
1834	779,504	217,568	1,713,971	2,733,046
1835	661,773	156,176	1,813,101	2,639,345
1836	598,756	189,867	2,126,693	2,929,321

In the absence of all further customhouse record the following table of the number and tonnage of ves sels in which the trading intercourse with Ireland h been carried on during each year of the present cen tury, will afford a pretty correct view of its amou and progress. If we compare the tonnage employ in 1801 with that of 1836, we shall find that they ha the proportion of 257 to 100, showing an increase 157 per cent. It will further be seen that this increa has been much more rapid during the last ten years which steam-vessels have been so much brought in use, than it was in the preceding years of the serie Up to 1826, the increase from 1801 was no more tha 62 per cent., showing a mean annual increase of 2½ pe cent.; whereas, in the ten years following 1826, the i crease has been 95 per cent., or 9½ per cent. annually

Years.	Inwards.		Outwards.

N TO

AMERICAN POSSESSIONS.

itary, measuring a few hundred miles back from the
t of the Atlantic, has been settled by people of
ygean descent. Excepting in a few districts, the
ander of the continent is possessed only by a thin
scattered population of aborigines. The southern
tropical part of North America is composed of the
ublics of Guatemala and Mexico; the most temper-
portion (from the 30th parallel of latitude to about
43d) forms the republic of the United States. The
e northerly part, with some islands, is in the pos-
ion of Great Britain, and comprehends the pro-
es of Upper and Lower Canada, New Brunswick,
a Scotia, Newfoundland, Cape Breton, St John's or
nce Edward Island, &c. The line of division betwixt
British possessions and the United States, is either
River St Lawrence and the lakes from whence it
ceeds, or an ideal and partly contested boundary.
nda is bounded on the east by the Gulf of St Law-
ce and Labrador; on the north by the territories of
dson's Bay; on the west by the Pacific Ocean; on
south by Indian countries, parts of the United
es, and New Brunswick. Canada is divided into two
vinces, the Upper and Lower, each of which has
herto had its own local government; but by a re-
act of the Imperial Parliament, the two provinces
united under one general legislative council and
se of assembly, two bodies respectively resembling
Houses of Peers and Commons in the mother coun-
and whose measures require the consent of the
ernor, as the acts of the home Parliament require
of the sovereign. The affairs of this, as of all other
nies, are subject to an ultimate control, vested immed-
ely in a colonial minister, but finally in the British
slature. In Lower Canada, or that portion next the
coast, the greater part of the population is of French
cent (this having originally been a French colony);
laws resemble those of France, and the French lan-
ge is generally spoken. Upper Canada, or more pro-
y *Inner* Canada, lies to the west and south-west of
lower province. Its inhabitants are of British de-
nt, and a very great number of them are from Scot-
l, both Lowlands and Highlands. The English law
church are here established; but there is the most
fect liberty of conscience, and as great a security
ife and property as even in Scotland or England.
er Canada is divided into districts, counties, ridings,
nships, special tracts, and allotments, together with
ks of land reserved for the clergy and the crown,
lands appropriated to the Indians. A district con-
s two or three counties, and each county contains
a four to thirty townships. There are 13 districts,
counties, and 6 ridings, comprising together 273
nships. The line of division betwixt Upper and
er Canada is in one part the Ottawa or Grand
er; nearly all the other lines of division in the pro-
ces are straight, without regard to physical distinc-

tion, such as hills and rivers; and this peculiarity is common over the whole of North America. The average territory of each township may be estimated at 61,600 acres, making an aggregate quantity of 16,816,800 acres. About 7,000,000 of acres have been granted to different classes of settlers; 4,805,400 acres are reserved for the crown and clergy (part of which has already been granted by the crown to the Canada Company); and 5,011,400 acres remain to be granted within the townships. This tract of country, chiefly bordering the north shore of the River St Lawrence Ontario, the northern side of that lake, and Erie up to Lake St Clair, and of the communic tween it and Lake Huron, a distance little sho hundred and seventy miles, and stretching n from the water to a depth varying from fifty miles, is composed of a soil, which, for produc ness, variety, and applicability to the highest of agriculture, may challenge competition choicest tracts of land in the New World.

Upper Canada is chiefly a flat country, a the greater part covered with timber, but po number of chains or ridges of high lands, ru different directions, and separating the sou channels of innumerable rivers and brooks. Th and level districts are called Table Lands. T feature of the country is its water-courses. B at the map, it will be perceived that there is a large lakes, communicating with each other; unequalled by any inland sheets of water in th and are entitled to the appellation of fresh-wa for they are not only of great extent, but are be affected by storms like the ocean itself. Th most, called Lake Superior, is 381 miles long, broad; Huron, 218 miles long, and from broad; Erie, 231 miles long, and about 70 in Ontario, 171 miles in length, and 60 in bread waters of Lake Erie, on issuing from its low mity, form a river of nearly half a mile broa in its course pitated over pice to a dept feet, thus ma famed catarac of Niagara. is, at the dista few miles be ceived by La rio, whence i River St Lawr of the largest in the world, a after a course miles, falls int lantic. This river is 90 m at its mouth, navigable for the line for 4 from the ocea upper parts, gation is imp *rapids*, or the of the strea an inclined pl some of these ments are obv means of ca cently cut; w there is now nued water c cation for vess the Atlantic interior or i lakes. The Canal, a ma undertaking, Lakes Erie a rio, and afford sage for vessels size. Lake Er connected by with the Hu river of the States, which into the Atlant Ottawa, or Gr er, is next to Lawrence in

dland, and Bathurst districts.—Situated between two
ad and navigable rivers, the Ottawa and the St
wrence, and centrally traversed in a diagonal course
an extensive and splendid sheet canal, connecting
navigation with the waters of Ontario, this section
country evidently enjoys important geographical and
al advantages. Its surface presents, almost uncx-
tionably, a table level of moderate elevation, with a
y gentle and scarcely perceptible depression, as it
proaches the margin of the magnificent streams by
ich it is bounded to the northward and southeast.
soil, though sometimes too moist and marshy, is
rerally rich and fertile, and chiefly consists of a
own clay and yellow loam. This section is intersected
numerous rivers, remarkable for the multitude of
ir branches and minor ramifications. There are
a number of good public roads, both along the St
wrence and Ottawa, and into the interior. Great
dustry and attention to improvement are displayed
on most of the lands throughout this tract. The
n of Kingston, the largest and most populous of the
per provinces, is very advantageously seated on the
th side of the St Lawrence, or rather at the eastern
remity of Lake Ontario. The streets are regular
well planned, and the number of houses may be
imated at about 620. The town has now considera-
e mercantile importance; the harbour is well shel-
ed and convenient.
The thriving village of Perth is situated in the town-
p of Drummond, on a branch of the Rideau, and
upies a central position between the Grand River
d the St Lawrence, communicating by tolerably
od roads with Kingston to the south and Bytown
the northward, at the opposite extremities of the
deau Canal. The first establishment, fostered by
vernment, was made in 1816, by British emigrants,
efly from Scotland, many of whom are now at the
ad of excellent farms, possess comfortable habita-
ns, and reap the fruits of their perseverance and
dustry.
Ascending along the shores of Lake Chaudiere, the
ects of note first presenting themselves are the rising
wnes in front of the townships of March and Tar-
on; they are chiefly composed of families of high
pectability, possessed in general of adequate means
avail themselves of the advantages that are incident
a newly opened country. High up, on the bold and
rupt shore of the *Chats*, the Highland chief Macnab
erected a romantic edifice, Kinell Lodge, which he
succeeded, through the most unshaken persevc-
nce, in rendering exceedingly comfortable.
The Central Section of the province (continues the
urate Bouchette) embraces the districts of Home
d Newcastle, which occupy a grant of about one
ndred and twenty miles upon Lake Ontario, extend-
from the head of the Bay of Quinté westward to
line between Toronto and Trafalgar. Although
s populous than the tract of country composing the
t part of the division which we have adopted, this
tion of the province does not yield to it in fertility,
d is equally well watered by numerous lakes, broad
d beautiful rivers, and innumerable streams and
ooks. The rivers in general abound with excellent
h, and especially salmon, great quantities of which are
nually speared in the River Credit, for the supply of
western country. In front of Newcastle district, on
borders of Lake Ontario, the soil consists of a rich
ck earth; but in the district of Home, the shores of
lake are of an inferior quality. The lands upon
nge Street [roads are frequently called streets in
nada], which connects Toronto with Lake Simcoe,
exceedingly fertile, but so destitute of stones (for
lding and other purposes), as to create some incon-
nience to the settlers. A sandy plain, of some extent,
ts some distance north of Ontario, towards Rice
ke; but, saving this, and probably one or two more
nparatively insignificant exceptions, the soil of this
ct of country is extremely fertile, well adapted for
riculture, and yields luxuriant crops of wheat, rye,

maize or Indian corn, peas, barley, oats, buckwheat, &c. The fronts of all the townships from Kingston to Toronto are, with few exceptions, well settled; roads lead through them, from which, in many places, others branch off to the interior. At intervals, rather distant indeed from each other, there are a few small villages. On the lands that are occupied, great progress has been made in agriculture: the horses, generally speaking, are strong and well built; and the inhabitants appear to be possessed of all the necessaries, as well as most of the comforts, that a life of industry usually bestows." In this division is the town of Toronto. Our authority next proceeds to notice

The Western Section, which includes Gore, Niagara, London, and Western districts. "With the aid of a little fancy," says Bouchette, "this tract of country may be shaped into a vast equilateral triangular peninsula, whose base, extending from Fort Erie to Cape Hurd on Lake Huron, measures 216 miles, and whose perpendicular, striking the Detroit River at Amherstburgh, is about 195 miles. It is bounded to the north and west by Lake Huron, River and Lake St Clair, and Detroit River; south by Lake Erie; and east by Niagara River, Lake Ontario, and the western limits of the district of Home. The surface it exhibits is uniformly level, or slightly undulating, if we except a very few solitary eminences, and those parts of the districts of Gore and Niagara traversed by the ridge of elevated land. The variety of soils, and the diversity of their combinations, observable in these four districts, are by no means so great as might be expected in so extended a region. The whole tract is alluvial in its formation, and chiefly consists of a stratum of black, and sometimes yellow loam, above which is deposited, when in a state of nature, a rich and deep vegetable mould, the substratum beneath the bed of loam being generally a tenacious grey or blue clay, which in some parts appears at the surface, and, intermixed with sand, constitutes the super-soil. There are numerous and extensive quarries of limestone to be found in these districts, that supply the farmers with excellent materials for building. Freestone is also found, but in small quantities, and generally along the shores of the lakes. The Thames River, in this section, rises far in the interior, and, after pursuing a serpentine course of about one hundred and fifty miles, in a direction nearly south-west, discharges itself into Lake St Clair." This portion of the province seems to us to be that most worthy of the attention of the emigrant; the climate is pleasant, the land excellent, the rivers numerous and useful; roads are opening up in all directions for the benefit of the inhabitants; and although at a great distance inland, the communication with the ocean is conveniently kept up by means of the lakes and canals. Were we about to emigrate, we would have little hesitation in directing our steps towards this portion of Upper Canada, so tempting from the prodigious vastness of its waters, the exuberant fertility of its extensive plains, its luxuriant orchards, and its busy scenes of rural industry.

Nearly equal to this tract, and superior as regards exemption from ague, is the Simcoe district, lying betwixt the lake of that name and the eastern part of Lake Huron. This land is about 900 feet above the level of Ontario, and of the richest quality. A steamboat on Lake Simcoe conveys the produce to Holland-Landing at the south end of the lake, and a railroad has been projected from thence to Toronto. A great part of this tract being settled by naval and military half-pay officers, who draw their pay quarterly, there will, consequently, be more ready money circulating here, and more employment for all kinds of tradesmen, than in most other places. The land here is rising rapidly in value. We may state that all kinds of tradesmen will find abundance of employment at Toronto; but, in consequence of its low situation on Lake Ontario, it is liable to agues, and will be avoided by those who are subject to such affections.

It may here be remarked, that the general salubrity of the climate improves as you recede from th of the lakes and great rivers, although these as a counterpoise, a greater facility of disposing plus produce.

The prevailing maladies on the shores of th and large rivers are fevers and the ague, wh though a most annoying complaint, is very fatal. By great care being given to regularit bowels, moderate use of spirituous liquors, kee feet dry, and avoiding unnecessary exposure air, it may generally be averted. We cannot suf impress on the minds of emigrants the neces will be under of adhering to temperate hab the Canadas, whisky is much cheaper than in hence this advice becomes of double importanc

Mr Fergusson, in his "Practical Notes," m ing a tour in Canada in 1831, furnishes his with a number of valuable illustrations of the s appearance of the Upper Province along the r pursued: indeed, all intending emigrants who ca it should purchase his very instructive volume. S of that part of the territory adjacent to Lower he says—"Returning to the St Lawrence, we e Upper Province, the Ottawa here forming the b line. As we ascend the river, we find numerous and thousands of acres well adapted for the One of the first settlements we meet with is t garry district, an extensive tract of good land, the advantages of water carriage. The language toms, and the native courage of their Celtic s distinguish the clan, though at the same time afraid, accompanied by some of those less p traits which stamp the Highlander as more at wielding the claymore, or extracting mount than in guiding the ploughshare to slow but results. The farms are but indifferently in considering the advantages they have enjoy much valuable time is expended in the depth forest, in a demi-savage life, cutting and p timber for the lumber merchant, which, if devoted to the cultivation of the land, would c be attended with infinitely greater benefit, b physical and moral point of view.

To go minutely into the statistics of even th of the river, would far exceed the limits to whic necessarily restrict myself. Suffice it to say, th stant succession of eligible situations present th for estates and farms. I was much pleased Matilda district, and consider it capable of g provement. The soil is a fine mellow sandy loa times perhaps rather light, but admirably ada turnip husbandry and fine-wooled sheep, with n beautiful situations for residences, the noble rence ever forming a prominent feature—its varied by lovely wooded islands, similar to tho justly admire on many of our British lakes. In ap ing Kingston, or the east end of Lake Ontario, th Gananoque falls into the St Lawrence, and at it is the establishment of Messrs M'Donell, two who came about eight years ago to the col who, by steady enterprise, without original capi realised considerable wealth, while, along with have secured the respect and esteem of all wh them. They have here what is called in Am valuable water privilege, or fall, and have erect and saw mills to a large extent.

Having received very encouraging accounts ston, of the country along the Bay of Quinté, inlet of Lake Ontario, formed by a peninsul Prince Edward's Island, I made an excursion district. The scenery was pleasing, in many very fine; and settlements are forming on eve The soil is partly clay, partly loam and san ciently rich to yield fifteen crops of good wheat, punity, in a period of twenty years. Granite, lim and schistus, or clay-slate, are successively m Wherever a stream or creek of any importance the lake, there we find a mill-seat and a village up, the embryo, in many cases, of considerable

two feet long and eighteen inches broad; these as much of the surface of the snow that the r sinks but a very few inches, even when the is softest.

hile the external weather is guarded against by the dians when out of doors, their habitations are also ed against the destructive power of intense cold. walls of the houses are usually plastered on the de, to preserve the stones from moisture, which, ed on by the frost, is liable to split them; and the ments are heated with stoves, which keep the temure at a higher and more uniform rate than our sh fireplaces will.

must not, however, be supposed that the severity winter is any obstacle to out-door amusements, gh it stops the navigation of the rivers and the cultion of the soil. On the contrary, winter in Canada season *of* joy and pleasure; the cares of business laid aside, and all classes and ranks indulge in a al carnival, as some amends for the toil undergo during the summer months. The sleigh or carof the humble *habitan*, or proud *seigneur*, is got y all over the country; riding abroad on busior pleasure commences; visiting is in active play een friends, neighbours, and relatives; regular city town balls, and irregular pic-nic country parties re each guest brings his dish), are quite the rage; after dining, dancing and supping, and dancing , the wintry morning dawn is often ushered in the festive glee is yet at its height, and a violent -storm blockades the pic-nickers until broad daynables them to carriole towards home, over the ound rivers and waves of snow, in all the enjoyy which the lightest-hearted beings can be supposed ble of, and considering the hardships and the inveniences of the moment as a zest to the more staid fashionable routs of Quebec and Montreal.

ravelling over frozen rivers or lakes is not unatd with danger, for it sometimes happens that the h, its horses, and passengers, are engulfed and id beneath the ice. Fortunately, the thin or weak s of the ice are in general of no great extent, and ost instances the passengers are able to leap from vehicle to a part sufficiently firm to bear them. Canadians have a curious contrivance for saving horse on these occasions. A rope, with a running e round the neck of the animal, is part of the furre of every carriole. As soon as he sinks in the the driver pulls this rope till he strangles him, or ast so far deprives him of sensation that he can no r struggle. The poor horse is thus, by a severe oss, prevented from doing that which would sink deeper in the broken ice, and, when the passengers safe, he is pulled upon the firm ice, the rope is ned, respiration re-commences, and generally, in w minutes, he is carrioling away again, as well as . This singular and almost incredible operation been known to be performed two or three times y on the same horse; and the Americans say that, Irishmen, the animals are so used to being hanged, they think nothing about it.

he other British possessions in North America are a Scotia, New Brunswick, Prince Edward Island, Breton, and Newfoundland; the last, however, is sland in the Gulf of St Lawrence, and unsuitable he settlement of emigrants. The whole lie within 41st and 51st degrees of north latitude, and from t the 54th to the 68th degree of west longitude. se countries are not so warm or genial as Upper ada; they are what Scotland is to England—more ed and mountainous, and more unpromising in their ines; but they are not less healthy and pleasant, they possess the advantage of being the nearest nial possessions of Great Britain, with the likelihood emaining longest under its paternal government.

NOVA SCOTIA.

ova Scotia is a peninsula connected with the main- by a narrow isthmus. It measures about three

hundred miles in length, but is of unequal breadth; altogether, it contains 15,617 square miles, or nearly ten millions of acres. One-third of this superficies is occupied by lakes of various shapes and sizes, spread in all directions on the face of the peninsula. There is no part of the land thirty miles distant from navigable water, and in all parts there are fine streams and rivers. The southern margin of Nova Scotia is broken and rugged, with very prominent features, deep indents, and craggy islands. The features of the northern coast are soft, and free from rocks. It is bounded on the north by part of the Gulf of St Lawrence, which separates it from Prince Edward Island; on the north-east by the Gut of Canso, which separates it from the island of Cape Breton; on the west by the Bay of Fundy, which separates it from New Brunswick; and on the south and south-east by the Atlantic Ocean. Nova Scotia was first settled by the French in 1603, and till 1712 it was alternately possessed by the French and English, when the latter became its permanent possessors.

The soil of a country of such extent and such varied features as Nova Scotia, must necessarily be various. If an imaginary line be drawn, dividing the province in the exact centre, from east to west, the north-western half will be found to contain by far the greatest portion of good land. On the side towards the Bay of Fundy, the soil is very rich and free from stones, and contains many thousand acres of dyked marsh land. This is alluvial land, and is made by the deposit of the tides, a sediment composed of the finer particles of soil, brought away by the rivers and torrents in their course to the Bay of Fundy, of putrescent matter, salt, &c. This land, called marsh, after it has attained a suitable height, is dyked, and the waters of the rivers excluded. Nothing can exceed its fertility. In many places, particularly about Windsor and Truro, it yields three tons of hay per acre, and has continued to do so without manure for fifty years past. There is a difference in its quality. Where the water which overflows it is not much enriched by a long course through the country, it is thin, and of an inferior quality. The quantity of land enclosed in this manner is very great. At the head of the Bay of Fundy, there are seventy thousand acres in one connected body. There is one marsh in Cumberland containing nearly as much land as Romney Marsh in Kent, and of a quality vastly superior. There is something peculiarly agreeable to cattle in the grass growing upon these marshes, which has a wonderful tendency to fatten them. This land is found in great quantities in Cumberland, Macan, Napan, Londonderry, Truro, Onslow, Shubenacadie, Nine Mile River, Newport, Windsor, Falmouth, Horton, Cornwallis, Granville, Annapolis, &c. The next best quality of land is earned by a term peculiar to America, *intervale*, an alluvial soil made by the overflowing of large fresh-water brooks and rivers in the spring and autumn. The quantity of intervale is inconsiderable. It is to be met with in every part of the province, and is frequently found covered with a long natural grass, several feet in length, and is sometimes called wild meadow. The quality varies according to the size of the brook or river by which it is made, but in general it is very fertile and rich. The upland varies so much, that it is difficult to give a general description of it, but one fact deserves notice, from its extraordinary quality. It commences at Cape Rouladin in Cornwallis, and runs in one continuous range of high land northward one hundred miles in the direction of Digby, and varies from three to seven miles in breadth. It is a very strong soil, and, with the exception of a small excellent quality in Onslow, produces wheat and other grains in abundance. It sometimes has the land a very stony, and requires great exertion to render it fit for cultivation.

The mineral products of this part of America are *valuable*: Limestone is found in quality of every kind, *as coal, which is found at Sydney, in Cape Breton, to a great extent, and of better* quality than in any part of America; it is as highly valued as that from castle in England, and will bring as good a price market. In the district of Pictou, coal is disc in many places. There can be no doubt, the that the possession of this mineral will constitu of the chief advantages of these provinces over other. Limestone, freestone, and slate, abound, best qualities, and there is plenty of fine clay for Iron ore has also been discovered in several The province has no animals of a troublesome There are foxes, mice, squirrels, and rats. Amo feathered tribe there are a number of birds of th kind as in Britain, including those called game country, all of which may be shot and used a without any restriction. The only troublesome are the musquitoes and black flies, which are th ment of America; but they disappear in a great sure as the land becomes cleared and drained. be added, that the rivers abound with the fine among which are salmon and trout; and the yield large supplies of white and shell fish of di kinds.

It has been the peculiar misfortune of this p of the North American continent to be represen almost every writer as a gloomy, sterile regio stantly enveloped in fogs which obscure the su impede vegetation; whereas nothing can be mo tant from the truth. This strange representati only be accounted for, by supposing that the tra who have visited it did not extend their investig farther than the vicinity of Halifax, where the la a bleak and by no means agreeable aspect; but only a local characteristic, and the interior e much fine land, with a pleasant climate. The is generally covered with snow from the 25th cember till the 5th of March, in which respect it resembles Upper Canada; and during this the farmers draw upon sledges their wood and from the forest, and carry their produce to m It is difficult to say when spring commences, rather late and irregular in its approaches. vegetation does begin, it is very rapid, and two o days make a perceptible change in the amount foliage. The summer heat is moderate and r and by no means oppressive, nor so long-continued a week of very warm weather. The autumns are nearly as genial as the temperature in the middle day is similar to that of August in Britain, bei by a mild, clear, calm, and dry air, which gives cheerfulness to the spirits. This weather co sometimes not till the latter December, the evenings being, however, a little severer. At the eastern coast of Nova Scotia is generally finer and superior; but there are many of these epidemic disorders with which other countries frequently afflicted. Although the waters are good, they are not so strongly charged as the raw at other waters of less purity, nor nearly so humanity. Horses, cattle, sheep, and swine, during part of the year, may have only private a some degree of care and attention to their comfo and at most a small quantity of straw and hay. We have already mentioned the mildness of the climate, and the consequent saving of fuel. In the country is greatly by the extensive woods of the settlers. In ploughing, and agriculture in general, the large implements of husbandry commonly required, the p the country causes the scarcity of species. In the spring, when the ground is attaining a moderate degree of dryness, and time is precious, and when every hand should be devoted to the labours of the plantation, horses are employed in the most laborious operations. These horses, at this season, get no spiritous liquors, which is the true cause of the backwardness of the country as respects its territorial improvement.

Few parts of the world are so well watered as Nova Scotia. The rivers, brooks, springs, and stre

and in fish, while along the coasts cod, haddocks, ing, and other fish, are yielded in plenty to the erprising fisherman. The resources of the province thus inexhaustible, and, according to Macgregor, hable to the maintenance of at least three millions of abitants. As yet, New Brunswick has a small popu- on, and the principal settlements are along the River John and its lakes. On the northern side of the rance to this large river from the Bay of Fundy, nds the town of St John, the largest in the province, ugh not the capital. Fredericton, the metropolis l seat of government of the colony, is situated nearly nty miles above St John's, on the same river; it is l a village in appearance. The chief buildings are government house and a college.

The province of New Brunswick presents an exten- line of coast to the Gulf of St Lawrence on the east, le on the north it has part of Lower Canada, which arates it from the River St Lawrence upwards. Its ant capabilities for carrying on trade with the inte- r are thus very considerable. Miramichi is the chief er after the St John. It falls into the Gulf of St rence, and is navigable for large vessels for about ty miles. Along its banks, here and there, are seen huts and houses of settlers, who have not made at advances in cultivation. The cutting and export timber form the main trade of the district. About nty miles up, on the south bank, is seen the village Chatham, where many of the ships load, and where eral of the merchants are settled, who have erected es and wharfs. Four miles farther up stands the age of Newcastle. The Miramichi River divides into great branches. "On coming down the south-west anch (says Mr Macgregor), in the autumn of 1828, n where the road from the River St John joins the ramichi, about eighty miles above Chatham, I was onished at the unexpected progress made during so rt a period in the cultivation of the soil. Near where road parts off for Fredericton, an American, pos- sing a full share of the adventurous activity of the zens of the United States, has established himself. told me that when he planted himself there, seven rs before, he was not worth a shilling. He has w (1829) more than three hundred acres under cul- ation, an immense flock of sheep, horses, several es of oxen, milch cows, swine, and poultry. He has rge dwelling-house, conveniently furnished, in which lives with his family and a numerous train of la- rers, one or two other houses, a forge, with a power- trip-hammer worked by water power, fulling-mill, st-mill, and two saw-mills—all turned by water. ar these, he showed me a building, which he said he cted for the double purpose of a school and chapel, floor of which was laid, and on which benches were anged so as to resemble the pit of one of our theatres. said that all preachers who came in the way were come to the use of it. An English parson, a Catho- priest, a Presbyterian minister, or a Methodist acher, should each, he said, get something to eat at house, and have the use of the chapel, with equal isfaction to him. He then showed me his barn, and one place a heap, containing about ninety bushels of dian corn, that grew on a spot (scarcely an acre) ich he pointed out to me. This man could do little re than read and write. His manners were quite un- lished, but not rude; yet he had wonderful readiness address, and, as far as related to his own pursuits, ick powers of invention and application. He raised ge crops, ground his own corn, manufactured the x he cultivated and the wool of his sheep into coarse ths; sold the provisions which his farm produced, d rum and British goods, to the lumberers; kept a ern; employed lumberers in the woods, and re- ved also timber in payment for whatever he sold. made the axes and other tools required by the mberers at his forge; he ate, gambled, and associated th his own labourers, and with the lumberers, and others, who made his house a kind of rallying pow- appeared, however, to be a sober man, and a per-

son who had in view an object of gain in every thing he engaged in. He talked much in praise of the rich interior country, and how rapidly it would be settled and cultivated, if possessed by the Americans."

PRINCE EDWARD ISLAND.

This rich and productive island is situated in the Gulf of St Lawrence, betwixt Cape Breton on the east and New Brunswick on the west, and is separated from Nova Scotia on the south, by a strait of about nine miles in breadth. It measures 140 miles in length, and is 34 at its greatest breadth. The general appearance of this island from the sea is level, but, on landing, the scenery is varied with gentle undulations. It abounds with streams and lakes, and in many places it is indented with bays, no part being more than eight miles from the sea. The soil is in general fertile, yielding good crops of wheat and other grains; and parsnips, turnips, carrots, potatoes, and almost all the common culinary vegetables, succeed well. This island has been recommended to such emigrants as possess a knowledge of agriculture with that of the curing of fish. The climate of Prince Edward Island is in some respects similar to that of the neighbouring countries. The winter is said to be shorter than in Lower Canada, and the atmosphere is noted for being free of fogs. Agricultural operations commence about the beginning of May, and the harvest is generally over by the end of October. The chief disadvantage this colony labours under, and which is equally applicable to the others near it, is the great length of the winter, which obliges the farmer to lay up a very large stock of hay for supporting his live-stock. The sudden manner, also, in which spring comes on, abridges the period for sowing and planting, thus leaving the agriculturist comparatively idle at one season, and obliging him to work severely at another. The inhabitants are chiefly from Great Britain and Ireland, with a few Dutch and Germans. Mr Macgregor characterises them as hospitable, kind, obliging, and as, generally speaking, a moral people. The island is governed by a lieutenant-governor, council, and house of assembly consisting of eighteen members, who are elected by the people. Charlotte Town, the capital, is situated on the north bank of the River Hillsborough, on the east side of the island. The town stands on ground which rises in gentle heights from the banks of the river, and its harbour is considered one of the best in the Gulf of St Lawrence. A small group of islands called the Magdalens, have been recently annexed to Prince Edward Island, chiefly as fishing establishments.

PERSONS WHO OUGHT TO EMIGRATE.

"The persons who may be inclined to emigrate to Upper Canada," says Howison, "are of three different descriptions, namely, the poor peasant or day-labourer; the man of small income and increasing family; the man possessing some capital, and wishing to employ it to advantage. Persons of the first class never would repent if they emigrated to Upper Canada, for they could hardly fail to improve their circumstances and condition. The poorest individual, if he acts prudently and is industrious, and has a common share of good fortune, will be able to acquire an independence in the space of four or five years. He will then have plenty to eat and drink, a warm house to reside in, and no taxes to pay; and this state of things surely forms a delightful contrast with those hardships and privations which are at present the lot of the labouring population of Great Britain.

It is evident that some descriptions of emigrants will succeed better in Upper Canada than others. Those who have been accustomed to a country life and to country labour, are of course more fitted to cultivate land, and endure the hardships at first attendant upon a residence in the woods, than artisans or manufacturers, whose constitutions and habits of life are somewhat unfavourable to the successful pursuit of agriculture. But every individual, who to youth and health joins perseverance and industry, will eventually prosper. Mechanics cannot fail to do well in Upper Canada; when not employed in clearing lands, they will find easy to gain a little money by working at their professions; and they likewise have the advantage of being able to improve their dwelling-houses, and repair their farming utensils, at no expense. Weavers, being ignorant of country affairs, and unaccustomed to bodily exertion, make but indifferent settlers at first, and their trade is of no use to them whatever in the woods. Married persons are always more comfortable, and succeed sooner, in Canada, than single men; for a wife and family, so far from being a burden there, always prove sources of wealth. The wife of a new settler has many domestic duties to perform; and children, if at all grown up, are useful in various ways."

Every candid traveller in Canada concurs in these views; and it may be observed, that they are equally applicable to the other districts noticed in this work. "Of this, I think," says Fergusson, "there can be no doubt, that either the moderate capitalist, or the frugal, sober, and industrious labourer or artizan, cannot fail of success. *Fortunes* will not be rapidly or even readily acquired; but it must be the settler's own fault if he does not enjoy, in large abundance, every solid comfort and enjoyment of life, and rear around his table even a *forest* of 'olive plants,' without one anxious thought regarding their future destination or provision."

PASSAGE.

There are two ways of proceeding to Canada—by the St Lawrence, Quebec, and Montreal; and by New York and the Erie Canal. The passage by the St Lawrence is tedious and troublesome, and we recommend all who can conveniently do so, to take ship direct to New York; from that city they will at once go on by a steam-boat on the Hudson River to Albany, and from Albany be conveyed in a track-boat on the Erie Canal to Lake Erie, where they will find steam-boats ready to convey them in all directions. For those who prefer the passage by Quebec, the following information is given by an official pamphlet:—"Passages to Quebec may either be engaged inclusive of provisions, or exclusive of provisions, in which case the shipowner finds nothing but water, fuel, and berth places, without bedding. Children under fourteen years of age are charged one-half, and under seven years of age one-third, of the full price; and for children under twelve months old no charge is made. Under these conditions the price of passage from London, and from places on the east coast of Great Britain, has generally been L.6, with provisions, or L.3 without. From Liverpool, Greenock, and the principal ports of Ireland, as the chances of delay are fewer, the charge is somewhat lower [we would here strongly advise emigrants to sail, if possible, from a port on the west coast, as being a great saving of time, trouble, and expense]; this year the charge will probably be from L.2 to L.2, 10s. without provisions, or from L.4 to L.5 including provisions. [Emigrants intending to settle in New Brunswick, Cape Breton, or Prince Edward Island, will generally obtain a passage in the vessels bound for Canada; and ships for Halifax or Pictou in Nova Scotia are constantly sailing from the British ports.] In ships sailing from Scotland or Ireland, it has mostly been the custom for passengers to find their own provisions; but this practice has not been so general in London, and some shipowners, sensible of the dangerous mistakes which may be made in this matter through ignorance, are very averse to receive passengers who will not agree to be victualled by the ship. Those who do resolve to supply their own provisions, should at least be careful not to lay in an insufficient stock; fifty days is the shortest period for which it is safe to provide, and, from London, the passage sometimes prolonged to seventy-five days." Having wound up his affairs in this country, and otherwise prepared himself and family for proceeding to the land of their adoption, it is recommended that the emigr-

th and rhubarb pills; 6 lbs. of epsom salts, and 1 of senna—these medicines are very dear here; tin to fit the stove of the ship, and it is convenient to e one for hooking on the bars of the grate when the of the fire is occupied; kettle for making coffee,

Use no crockery, but instead, jugs and bowls of ; broth pot, frying-pan, and tin kettle."

he best months for leaving England are certainly rch and April. The names of the vessels to sail generally advertised in the newspapers. The nse of passengers to the British possessions in rth America is regulated by an act of Parliament Geo. IV. cap. 21), of which the following are the cipal provisions:—Ships are not allowed to carry sengers to these colonies unless they be of the height five feet and a half between decks, and they must carry more than three passengers for every four s of the registered burden; there must be on board east fifty gallons of pure water, and fifty pounds of ad, biscuit, oatmeal, or bread-stuff, for each pas- ger. Masters of vessels who land passengers, unless h their own consent, at a place different from that ginally agreed upon, are subject to a penalty of L.20, overable by summary process before two justices of peace in any of the North American colonies. The orcement of this law rests chiefly with the officers her Majesty's customs; and persons having com- nts to make of its infraction, should address them- res to the nearest custom-house.

f the emigrant prefers taking a passage to New York, should make particular inquiry respecting the vessel is to sail in, as the above law does not apply to ships rying passengers to the United States. We know of oung man with a small capital, who sailed from a t in the east coast of Scotland for New York, in a sel which was afterwards discovered to be not sea- thy. After beating about for three or four weeks he Atlantic, the vessel was driven through the Irish nnel, and had to put into the Cove of Cork to dergo repairs. The passengers were obliged to work watches at the pumps, and six weeks were expended ore the vessel really proceeded on her voyage, be- s having to purchase a new stock of provisions. To id a similar disaster, we would advise the intending igrant to inquire into the character of the vessel at office of the company with whom she is insured, and making any agreement with the captain, to be par- ular in having it in writing. He should stipulate for use of all conveniences in the ship; and also not to obliged to land for at least twenty-four hours after ting into port.

LANDING.

Previous to disembarkation, arrange your baggage a small compass, the fewer packages the better, but re them well secured—old dirty clothing, large boxes, l other useless articles, are not worth the carriage. you have any provisions left, such as oatmeal, pota- s, &c., you can sell them at Quebec at a profit, and id the expense of transport, and you can purchase kers' bread, butter, tea, sugar, and other necessaries re suited for your journey. All sorts of provisions y be bought cheaper, and generally of a better qua- , in Montreal and Upper Canada, than at Quebec. ess yourself in light clean clothing. Females fre- ently bring on sickness by being too warmly clothed. t your hair short, and wash daily and thoroughly. oid drinking ardent spirits of any kind, and, when ated, do not drink cold water. Eat moderately of tery food. Avoid night dews. By attending to the ceding directions, sickness will be prevented, with er serious inconveniences. When every thing is dy for disembarkation, and if the ship is lying at chor in the river, take care in passing from the ship the boat; avoid all haste, and see that your baggage n the same conveyance with yourself, or left under charge of some friend, with your name on it. If ship hauls to the wharf to disembark, do not be in urry, but await the proper time of tide, when the

ship's deck will be on a line with the quay or wharf. Passengers are entitled by law to the privilege of remaining on board ship forty-eight hours after arrival; and it is unlawful for the captain to deprive his passengers of any of their usual accommodations for cooking or otherwise; you may therefore avoid the expense of lodgings, and make all your arrangements for prosecuting your journey. If, previous to disembarkation, sickness should overtake you, proceed immediately, or be removed, to the Emigrant Hospital, in St John's Suburbs, where you will be taken care of, and provided with every thing needful until restored to health. Medicine and medical advice can also be had at the Dispensary attached to the Quebec Charitable Emigrant Society. This society will grant relief to all destitute emigrants. In Montreal there is a similar institution for the relief of emigrants. It is particularly recommended to emigrants not to loiter their valuable time at the port of landing, but to proceed to obtain settlement or employment. Many emigrants will find employment in the city of Quebec and its vicinity, as also in and about Montreal. Single men, in particular, are advised to embrace offers of this kind; but emigrants with large families had better proceed without delay to Upper Canada, as hereafter directed, or to situations in Lower Canada, particularly the eastern townships; and if they have sons and daughters grown up, they will find a sure demand for their services. Artificers and mechanics of all denominations, and farming labourers, if sober and industrious, may be sure of doing well. Blacksmiths, particularly those acquainted with steam-engine work, also good millwrights and sawyers by machinery, are much wanted in the Canadas. The current rate of wages lately paid to carpenters, masons, and other artificers, was from 3s. 6d. to 6s. or 7s. per day, according to circumstances; farm-labourers were paid at a lower rate. There is no demand for persons skilled in any of the ornamental professions, or for the preparation of articles such as are usually imported from England. A great number of labourers are usually employed on board ships, and about timber-yards, at Quebec and Montreal, who get from 3s. to 4s. 6d. a-day, and board generally found. The extravagant habits engendered in such occupations render it decidedly preferable for the labouring emigrant to proceed immediately to the country. Emigrants with families, and who are possessed of from L.20 to L.25, are advised to push immediately into the woods, in the vicinity of old settlements, where they can obtain provisions for their spare labour. The most vexing circumstance connected with money matters, is that the currency of the whole of British America is different from that which prevails in the United Kingdom; in other words, a shilling in England is different from a shilling in Canada. The money of Canada is locally of higher nominal value than what we understand by the term *sterling*, and is called Halifax currency. The difference varies; but it may be stated in general terms, that an English sovereign is reckoned to be worth 24s. or 24s. 6d. currency; or an English shilling is equal to about 1s. 2¼d. or 1s. 3d. currency. If you take English money to Canada, you will receive these high prices for it; but if you wish to turn currency into sterling, for the purpose of sending it home, you will incur a corresponding loss. All wages are, of course, reckoned in currency; therefore, when it is said you will receive 4s. a-day of wages, the actual value of this 4s. is only 3s. sterling. This distinction between currency and sterling will soon be learned, and is on the whole of less consequence than the practice of paying wages in goods. We have heard very serious complaints on this subject. From all we can learn, it is not uncommon for an employer to pay his workmen by an order for goods on a store, corresponding to the amount bargained for; and such is the high price at which articles are sold, that sometimes a workman, instead of getting 4s. a-day, does not in reality get more goods than he could buy for 1s. 6d. in England. Thus an apparently high wage dwindles down to a trifle.

Perhaps such p[illegible] e not resorted to by [illegible] able employers, [illegible] only prevail in parts country where a circ[illegible]g medium is scarce; have considered it pr[illegible] to mention the circum in order to put em[illegible]s on their guard. ascertain whether you are to be paid in cas goods, and act accordingly.

Having arranged all your business at Quel will proceed without loss of time to Montr steam-boat, on your route to Upper Canada steam-boats ply (or lately plied) to Montreal, 1 up the St Lawrence, which is performed in fro 30 hours. Take care not to engage a passage vessel from which you and your family will be occasionally to come out and walk; we have l disgraceful instances of this kind of cruelty. T on board the steam-boats were lately as follow may now be a little altered):—Deck passengers, 7s. 6d. each; children under twelve years of a price; and under seven, one-third. The rou fares to the principal places were lately as follo

Quebec to Montreal, by steam-boats,	7s
Montreal to Prescot, by Durham boats,	6s
Prescot to Kingston, by steam,	5s
Ditto to Coburgh, or Port Hope,	7s
Prescot to Toronto, capital of Upper Canada, Hamilton, and Niagara,	10s

From Niagara you proceed by the Wellan to Fort Erie, opposite Buffalo on Lake Erie, steam-boats, or sailing schooners, will conve destined to Port Talbot, or other parts of the district, or vicinity of Lake St Clair. Persons settle on the lands of the Canada Company will to York or Burlington Bay, head of Lake Onta

At most of the preceding towns and landing you will find government agents. If you are b Perth, or New Lanark, or the vicinity, disem Prescot; or you may go by Bytown on the Otta

If for the thriving settlements in the Newca trict, disembark at Coburgh or Port Hope, o Ontario. Those going to the townships of Seymo proceed from Kingston, by the beautiful Bay of to the mouth of the Trent River, from whence distance 18 miles, brings you to Seymour. If p ing to the Home or Western districts, disem Toronto, the capital of Upper Canada. Emigrant any where beyond Toronto, will in general find interest to make this their route. If for the district, proceed by the Niagara frontier to Lal and the Talbot Settlement. If for Bytown, Gr Hull, Horton, or other situations on the Ottawa proceed from Montreal and Lachine by the usu veyances. Such are the directions that were time since suitable; but as there are continual ch emigrants may find it necessary, on their arr act more by local information than any thing say on the subject.

We think it important to mention, for the ben the poorer class of emigrants, that there has for some years in Montreal a benevolent society o local importance, called the Canada Emigration ciation. This body of individuals, actuated by h motives, and desirous of forwarding labourers to where their services are required, affords ready ance to poor emigrants on their arrival at Mo It appears that, from the 11th of June 1840 close of the navigation by frost a few months lat society relieved 322 natives of England, 8778 of Ireland, 397 natives of Scotland, and 10 from many; total, 9507. Of this number, 201 were sixty years of age, and 587 were infants. The consisted in furnishing provisions and a humble lodging in sheds, also medical attendance, and pa of passage of individuals and families to places interior. The emigrants were greatly benefited by sent off without loss of time, as they were there only saved from the danger to their health and which would have been incurred by remaining length of time idle in a large city, but their tim

ers from selecting this province as their home. It rged that nearly all the lands within the settled incts of the province have passed into the hands of ate individuals; and that the new emigrant must ssarily go far into the depths of the forest, remote the peopled settlements, where, whatever may be excellence of his land, he will be remote from ets, mills, roads, or the means of procuring labour upplies, during the first years of his residence.

hese difficulties have existed to a great and distening extent, sometimes so as to induce a settler abandon his possessions. It is true, also, that a great portion of the land, especially in the older surveyed nships, comprehending the choicest locations in the hbourhood of roads and navigable waters, now be- s to private individuals; and it is this very fact enables the association to be of the most essential fice. These tracts are at present unproductive to owner, and if retained in their wild state, with the to their owners' obtaining higher prices, would inose such a serious obstacle to the settlement of the ntry, as might well justify the legislature in impos- a tax upon lands kept unimproved from so selfish narrow a policy. The association are happy in wing, for many of such proprietors are among its zealous members, that such lands generally re- in their profitless fertility, only because the hand an is wanting to turn them into productive corn- s and animated pastures; and that, if their fellow- ntrymen were here to make use of them, they would happy in giving to them portions equal to their ost wants, without money and without price; yes, every other aid which could tend to their future antage. And this, too, without any affectation of erosity on the part of the members of the associa- ; for they are well aware that, by the settlement and tivation of a portion of their lands, the adjoining t will become better worth the purchasing by future migrants, or by the settler himself, when he shall have ome prosperous.

his system of free grants of portions of private pro- ties scattered over the whole province, and therefore senting endless choice of locality, in respect to pre- us settlement of friends, &c., to such persons as have money to pay, or having small means, might, more eficially to themselves and the country, apply them accelerate the improvement of the land, forms the ncipal feature in the scheme of the association, by ich they hope to be useful to their countrymen. But s only one: there are cases where not only the poor, even the comparatively affluent settler, has had to counter difficulties which might well dishearten him, l even drive him to abandon his enterprise. Many mbers of this association have had practical knowge of the evils which they are now intent upon avert- from others; and are desirous of giving their exience without its price. The establishment of their gistry-Office for the sale of lands not devoted to the ove-stated object, and for supplying accurate infortion, statistical and otherwise, will be found of great to such as are beyond the necessity of receiving other kind of assistance; while, in locating those o shall be disposed to accept of their land, they will efully avoid the evil before mentioned, of sending m where they will be isolated and solitary, but under h an arrangement as will ensure to each the comts of society while he is engaged in the first, and in cases the most discouraging task he has to encoun- —subduing the forest."*

We may learn from these extracts that the Canans are now fully alive to the necessity of procuring teady supply of labourers as well as settlers to clear grounds, by which alone the country can be exted to develop its great resources.

Emigrants, on arrival, will find no difficulty in discovering names and places of abode of the agents of the Immigration iety: they are settled in most towns of the province, and we not doubt that they will give friendly advice and assistance to who present themselves.

SALE OF LANDS.—SETTLEMENT.

The mode of selling crown lands in the British North American possessions is far from satisfactory, the principle still pursued being to have periodical auctions of land at upset prices, by which the emigrant has in the first place to wait for the occurrence of the sale, and after all, when it takes place, he perhaps finds himself outbidden in price. This is a most serious evil, which government appears to be in no haste to remedy. On applying for information on the subject at the Colonial Office (December 1840), the following has been handed to us, and it may therefore be considered authoritative:—

"The regulations for the sale of crown lands in Canada, Nova Scotia, &c., are as follows:—In Lower Canada the public lands are henceforward to be sold at a fixed price. In the country of Ottawa, and in the country on the south bank of the St Lawrence as far as the Kemaba road, the price is for the present fixed at six shillings per acre, and for the remainder of the province at four shillings. In Upper Canada, lands continue to be sold by public auction, at an upset price to be fixed from time to time by the lieutenant-governor in council. This price varies according to the locality; but the average price of land in 1836, 1837, and 1838, was eight shillings per acre. In Nova Scotia, lands are sold the same as in Upper Canada, the price being at the discretion of the lieutenant-governor in council; but by a local act, it is in no case to be less than one shilling per acre. In New Brunswick the upset price is fixed at two shillings and sixpence per acre."

Such being the very unsatisfactory manner in which crown lands are disposed of in Canada and other parts of British America, we strongly recommend emigrants with only a small capital, either to employ themselves as servants till a sale occurs, or till they can hear of a cheap and commodious lot. At all times there are small farms, partially cleared, for sale, and in many instances these are preferable to crown uncleared lands. In making a selection and purchase, keep in mind the following points:—See that there is a tolerable road to the property; that it is not too far distant from a town; that it is not environed with clergy-reserve lands, which, being uncleared and without roads, except you assist to make them, are a nuisance; that you will have decent neighbours (English or Scotch, if possible); and that the district possesses a place of public worship, and school, or will shortly have them. Supposing you discover a place possessing a fair share of these recommendations, we advise you, above all things, not to buy it partly on credit, from a land-dealer or general possessor of property. Either do not purchase it at all, or pay for it at once, and get a good title to the property. If you allow a part of the price to remain unpaid, with the hope of liquidating your debt in the space of a year or two, you may almost surely rely on being turned out when the instalments come due, thus losing all you have paid, and all the labour you have expended. There are many landowners in Canada who make a regular trade of getting emigrants into their power in this manner, and turning them adrift after completely ruining them. Our next advice is one equally important—never, on any account whatever, take credit at a store. To do so, is the almost certain commencement of ruin. The store-keepers generally are glad to give credit to poor landowners; for, by a peculiar law of the country, they can attach the land for the amount of their claim, no matter how small it be; and as *cash* may not at a moment's notice be easily obtained, the settler may be speedily and in form of law stripped of all he possesses, and the store-keeper become the owner of his little hard-won territory. So dreadful is the effect of getting into debt in Canada, that we have heard of cases in which the families of poor but shrewd settlers have lived during winter on little more than a few potatoes per day, rather than incur a debt of a few shillings to the next store-keeper.

The difficulties at first in fixing and settling upon a farm are very great—much greater than one in this country has any idea of; but by prudent and diligent management, no one need despair, and in the end a state of comfort will unquestionably be attained. Having acquired property, the first thing you have to do is to select a favourable spot for your log-house, which should be near a spring of water or running stream, and where a *cellar to keep your potatoes in winter can be dug under the house*. Carefully clear the timber and brush to a distance from your dwelling and out-buildings, or, in the event of fire in the woods, great risk is incurred of their being destroyed. If you proceed to build house and clear lands on a large scale on first arrival, it rarely succeeds so well; for the price of labour is so high, and the difficulty of getting persons to work, added to the great expense of providing food for increased numbers until produced from your own land, ought in every instance to induce caution in laying out money; but a crop of potatoes and fodder for a cow is the first object, and this may be accomplished the first year, if you arrive early. The second you will be enabled to supply your family with the necessaries of life from your own grounds; and the third year you may find yourself possessed of a yoke of oxen, a cow or two, and a year-old calf, a couple of pigs, poultry, an abundance of provisions for your family, and fodder for your cattle. The Irish and Scotch peasantry know well how to value the economy of a milch cow; every new settler ought to strive to obtain one as early as possible, taking care to provide a sufficiency of food for the long winter. Cattle require a little salt in Canadas. It is not considered necessary to go further into the details of the first settlement, as on all these points you will be guided by your own observations on the spot, and the advice you will get from the land agents and superintendants.

ACCOUNTS GIVEN OF THESE COUNTRIES BY SETTLERS.

We quote the following letter from Upper Canada from the United Service Journal:—

"Dear ——, You wish me to give you some account of Canada, and I will endeavour to do so; and if the little that I have to say on the subject does not tend to instruct, it will, I hope, serve to amuse you, and enable you to form correct ideas of this remote but interesting corner of the world. I may not possess extensive information upon every subject connected with Canadian affairs, nor do I wish to tire you with lengthened or studied details. Having resided many years in Upper Canada, and circumstances having obliged me to consider it my adopted country and home, I have grown imperceptibly attached to the rough life of a woodsman; but I will endeavour to divest myself of prejudice, and hope to be able to present you with a plain unembellished account.

Emigrants coming to Canada generally entertain very erroneous opinions; their information having been collected from the writings of people who have little knowledge of the country, or are governed by interested motives: they come full of romantic whimsical notions, but perfectly ignorant of the country they are about to inhabit, and of the trials that await them. On their arrival, they ought to abstain from eating new potatoes, green peas, unripe fruit, &c., or use them in moderation; for many, on their first arrival, are afflicted with dysentery, which, I am confident, is occasioned by the greediness with which they devour vegetables of every kind, after being confined for a few weeks to the use of salt provisions. Fever and ague are common complaints all over America, but seldom prove fatal. They generally make their appearance in new settlements, in four or five years after we have commenced clearing land, rage for one or two years, and then almost wholly disappear. They are probably to be attributed to the foul vapours arising from the decayed stumps and roots of trees and other vegetable substances. Intermittent and other fevers are common in the neighbourhood of large marshes

nant ponds. Emigrants ought to avoid such

sixteen years ago, a number of families came
agow and its neighbourhood. They were as-
r government, and settled in the district of
. They were moral and industrious, and an
on to the country; but such was the bad
of the land selected for them, that many of
er struggling for years, abandoned their farms,
oved to other places. Clearing land is labo-
rk. The first thing we do is to underbrush it;
cut the young trees and bushes close to the
and put them together in large heaps. The
for underbrushing is when the leaves are on,
the snow falls; for when the snow is on the
we cannot conveniently cut the bushes low;
cut the trees down; the small branches are
upon the brush heaps, and the trunks are cut
of about twelve feet each; good straight logs
sh, cedar, and some other kinds, are reserved
verted into rails. The cutting of the timber
chopping, and is mostly performed in the
s we have then most leisure: when the brush
e sufficiently dry, they are set on fire. Log-
t commences.
s are numerous, and are very destructive to
d occasionally to young cattle. I have heard
attacking travellers; but upon inquiring into
orts, have always found them mere fabrica-
ough I know two instances when travellers on
k have seen wolves in the middle of the road,
trying in vain to frighten them away, or urge
ses forward, have been obliged to turn back.
net them when travelling alone and unarmed
the woods, but never was even menaced by
n winter, when oppressed with hunger, they are
gerous. The wild-cat, or cat-a-mount, in figure
strong resemblance to the domestic cat, except
l, which is not above two inches in length, and
ith black, as are also the ears; it is of the
lour as the wolf, and appears to be quite as
d powerful, though shorter in the legs: they
the tops of the tallest trees with facility, and
to be very fierce; they destroy sheep and other
animals. Bears are also numerous: they
principally on nuts and roots, and occasionally
great depredation in the fields of Indian corn;
walk off with pigs, sheep, and calves, when
t a chance. We have also beavers, racoons,
, and many other animals. Our woods abound
r, hares, partridges, pigeons, and many other
game. There are a great variety of ducks in
rs and marshes; and here, in the western dis-
have wild turkeys and quails; our rivers and
e equally well supplied with fish."

etter goes on to describe a number of snakes
re found in Canada, such as the water-snakes,
ome suppose to be venomous; two kinds of
akes, which are both very dangerous; there
garter snakes, copper-head snakes, and blow-
rs. These reptiles are only to be found in par-
districts, and with common precautions little
may be expected from them.

following letters are from a gentleman who
ear the township of Yorra, about a hundred
est from Toronto. He says—"I am installed
; 800 acres of clergy reserves and Canada Com-
ands contiguous, and am in treaty for 800 more
ivate individuals, which, one with another, will
e in fifteen shillings currency per acre. The
sides being bounded by the River Thames, is
at every half mile by streams running into it,
ngs giving the purest water; the land slopes
the south, and altogether is calculated to create
ion. I have set people to work, to chop, clear,
d fit the land in every respect for sowing, for
dollars an acre, or L.2, 15s. The fencing will
at the outside two dollars more per acre, and
one dollar and a half, making in all L.3, 12s. 6d.

My log-house, 34 by 22, and two storeys, will give me six good rooms at least for roughing in, and will cost me at the outside, to make it comfortable, not more than L.50. In this my friend and I will live during the winter, and until I get things prepared for building. We have every thing as comfortable and good to eat as the most reasonable man could wish; and barring pewter spoons for silver, horn-handled knives for ivory, our table would not blush to stand alongside one at home. I have made three trips to Toronto since our location, and bought a load of things each time. I must make three trips more, most likely, before winter, to complete stores, pick up labourers, and arrange for land. Well, with the whole of this hard work, much hard dealing, thought, and calculation, I grow more and more enthusiastic in favour of the country. Our climate is delightful, and our neighbourhood excellent and obliging. *I would not for twenty thousand pounds return to Scotland.* I want not money, but to lead a useful life. Now, Alexander, if you want to buy land for your boys, do it immediately." Here the writer enters into private details, so we pass on to his next letter. After giving some further account of his operations, he thus proceeds to speak of his toils:—"Riding fourteen miles to get lumber or sawn timber drawn, to ride to measure every cart-load myself, and to do at least one-half of what one at home would find people trustworthy enough to do for him, you will not wonder that the toils of a beginning are as numerous as they are weighty. However, I like the life amazingly. I find at all events some scope for my mind; and if there be difficulties to surmount, there is no little pleasure in overcoming them, and still greater in feeling one's self equal to it. I have just been buying a hundred bushels of oats at 11½d. a-bushel, so you know what oats may be had for; excellent apples, 7½d. per bushel; wheat is high this year—that is, a dollar a bushel; and butcher meat for 2½d. and 3d. per lb.; potatoes the same price as oats."

In another letter he says—"Since my last, I have removed to my new residence; and although, as I said before, I have to break my neck to get a view of the heavens overhead, get the cramp in my fingers from milking the cow in these cold mornings, follow the trail of my oxen when they stray, and be alternately plasterer, glazier, slater, delver, and chopper, so that my hands have become as hard as elm, and their shape like bullock's lights, with Bologna sausages for fingers—I am, for all this, as pleased as Punch, and even get fat on it. Indeed, I must say, I have been indefatigable since my adoption of my new calling; so that, if I don't succeed in establishing some degree of order, and management, and evidence of prosperity, 'twill neither be for want of activity, decision, good humour, or system." It is clear that this is the sort of person for a Canadian life. Again, in January 1834, he says—"I rise every morning at five o'clock, and awake the household; and while the servants are managing the breakfast, so as to get all comfortably over by daylight, I light the fire in our room, for I exact no service not absolutely necessary. I don't mean what you call *necessary* at home, but things of far lower estimate. My shoes, for instance, which are somewhat of the thickest, are well-greased twice a-week, instead of being blackened, which is very well for walking the streets, but of wondrous little use here. I have cut down twenty acres since my last, and am continuing the good work. We muster in all seven axes, and get through about an acre a-day; but as other matters interfere to take off my hands, I find I cannot average more than about twelve acres a-month. I see by my account with the bank that they have credited me with ——; and as money currency goes as far here as money sterling does in England, I calculate I am a gainer of rather more than a fifth by the transfer: that, with the high rate of interest, the cheapness of living, and exemption from taxes, makes me at least three times as rich a man as I was at home."

By the next letter, we find the writer equally pleased with the country, both as to soil and climate, and also

for its he
! was
He had now a good deal cleared,
his timber from twenty-five acres
had rented all that he had cleared
Scotland for a third of the crop, and
acquiring the means of a lasting inde-
with all the attributes of rural wealth
has been said that gentlemen should
to Canada—that it is a country only for
ople; but this idea is quite fallacious. The
is but one of many hundreds of gentlemen who, during all their lives before, had never soiled their fingers with labour; and yet we see what is the result. We venture to say that Mr R. is as active, and puts his hands to as much dirty and hard work, as would be the case with a person bred to rough country labour; while his education and intelligence lead him into the most advantageous course of operations.

Those who cannot immediately purchase land in Canada, sometimes put in grain along with that of any neighbouring farmer, and receive a share of the crop. "This being the case with me this year," says a writer of a letter dated January 1834, "one of my neighbours puts in two fields with me—one of rye, of which he does all the work except half the harvesting, affords half the seed, and gets half the crop; another of peas, of which he does all the work, affords all the seed, and gets two-thirds of the crop."

We quote the following from a letter written by a settler in the township of Nichol, Upper Canada, to a friend in Scotland, and which appeared in the Aberdeen Herald:—

"From the experience of myself and friends, I give my plain candid opinion on this matter, when I say to the emigrant newly come amongst us, beware of attempting to clear more than you have a rational prospect of finishing in time for the season of sowing or planting. Two acres well cleared are worth five acres indifferently finished; and if you can set about it by the first or second week in July, you may get two acres nearly ready to receive fall wheat. Should you attempt seven acres, unless you have a strong force and plenty of dollars, it is ten to one but you will fail of being ready in time; and if the spring is as backward as I have seen it, you would be too late for cropping them. Now, if you can get two or two and a half acres sown with fall wheat the first autumn you are in the woods, and get half an acre cleared for potatoes by the 15th or 20th of May, which may be quite practicable, and perhaps another half acre cleared for turnips by the 20th of June, I maintain there is a rational prospect of your eating the produce of your own farm during the second year of your settlement, and have as much as bring you to the next crop; but bear in mind, that during the first year you must buy in your provisions or work for them. Go on clearing for fall wheat during the summer, and perhaps you may get four or five acres ready by the second autumn; and if you can get the stubble burned off, when your first crop of fall wheat grows, by the 20th or 25th of May, next year you may get in a crop of barley without ploughing, and timothy-grass seed grown along with it, to give you a crop of hay during the third year. If you can get another acre or so cleared for potatoes, you will have some of them to dispose of after supplying yourself; and where turnips and potatoes grew the previous year, you may get spring wheat or oats sown the next. This may be a rational prospect of the fruits of your industry at the end of your third autumn or second harvest, and thus you may begin to feel yourself in a thriving way. This, however, brings me to speak upon the next matter for the emigrant's consideration—live-stock. If he can possibly afford it, he must endeavour to procure a cow to begin the world with. During the summer months, a cow gets her meat in the forest without costing the owner a farthing for keep; and for the other six months straw and turnips will be advantageous, but tops of trees, felled down for the purpose, seem to be the food they are instinctively inclined to prefer. The last, of course, costs the farmer the trouble of chopping them down, but as he may be engaged doing so purpose of clearing, he thus 'kills two dogs wi bone.' Clearing can scarcely be carried on the assistance of a yoke of oxen; but unless t grant can buy food m, I would not reco him to purchase ring the first autum rather hire a m oke to assist him wh where necessary, and he may have some more ragement to buy a yoke during the following ye the prospect of having some food growing fo You will unders and that I have been writing a *bush farming*, as it is called, and taking it for that I am addressing an intending emigrant who seised of a moderate supply of money. In fact, ing he had a considerable amount with him, still be nothing the worse for adopting the plan I h down. Were it possible to get a small cleared commence upon, it would perhaps be more a geous to the emigrant.

I now finish my letter by giving my opinion subject as a whole. If a man has firmness, p and fortitude, combined with perseverance a dence, he will in the course of a few years be qu fortable—I might say independent—even suppo set himself down in the bush at a considerable from neighbours; but if he could get the chan farm with four or five acres cleared upon it, recommend him to fix upon such in preference completely wild, unless he is careless of what neighbours he may be likely to have about him

Another letter, dated from Fort Erie, says—" is selling here for 5s. per bushel; oats, 1s. bushel; butter, 6d. per lb.; eggs, 6d. per dozen 2½d. to 3d. per lb. Servants' wages, L.2 to L.2, month, with board. Tea, 3s. per lb.; green tea, Potatoes are selling at 1s. per bushel; 350 bu an average crop per acre.

A farmer can settle here in style with L.500, a as good a table as any of our lairds; but of cour attend to his business and keep at home, as a here are much less to be depended on than the Scotland. I have seen a few persons in the ag they seem to think little about it; those on La are more liable to it than those on the lower la

Extract from a letter dated Sandwich, West trict, Upper Canada, which appeared in the In Courier:—

"In this district, after mature consideration, finally settled. Having at a very early period be nised by the French, and since that time vastly im by its numerous proprietary, it has all the com advantages of the mother country, with infinitely capabilities of supplying the raw materials. T tility of our soil is even here proverbial, and o duce superior in quality; so much so, that ou is uniformly a shilling ahead of any other. Al sides of the isthmus on which we are planted (f the Lake St Clair on the one hand, and Erie other, it almost is such), there is ready and che veyance by steam; while the Thames, a not majestic stream that intersects the interior, o the inland parts. Not even a tree is felled in motest parts of the country, but may be conve water to market. That of Detroit, on the An side, is flocked to from all parts of the Union an British possessions; and, both from the numbe attend, and the quality of the articles produ among the best in the country. There is abund woodcocks, snipes, and deer in the district.

But what chiefly fixed my determination w salubrity of the climate, which, compared with Lower Canada, and most parts of Upper, is imm ably superior.

We have abundance of room for settlers. W to sail down the Thames, for instance, and country along its banks studded with cultivated and closely shaded behind with the 'tall trees of n growth,' waving their majestic foliage to the h heaven, and seeming to court the hand of man

gaged for one year. My wages are not so high as
ch they will be when I become better acquainted
he climate of the country. Just now I have L.40
nums, and bed, board, and washing. I have three
of a garden, along with ten acres of apple orchard,
e charge of; and am assisted by two labourers
re constantly with me. The garden is surrounded
h brick walls, covered with peach and nectarine
The peaches here grow to a great size, and ripen
antly in the open air. The grapes bear well on
es in the garden. I had a fine crop of these,
ior to any I ever saw in the houses at home; and
melons are also surpassingly fine. I cut 300 of
ese melons from a small piece of ground not more
20 feet by 12. Some of them weighed 15 lbs., and
of them from 5 to 7 lbs. They require no atten-
care whatever. Just sow the seed in the open
n, and keep them clear of weeds, and this is all
ave to do. We do not think it worth while to
cucumbers garden room. We sow them about
itch nills in the fields, and they produce most
iantly. Gourds come to a great size, some of them
ing 50 lbs. You will not be surprised that we
row all these things in the open air, when I in-
you what degree of heat we have for three months
during the summer. The thermometer stood for
months at 99 degrees all day in the shade, and
night. I thought I would be roasted alive, being
d to take my bed out of the house and lie in an
shed, with nothing on but a single sheet; and after
